Again, as evidence of the Singer speed and service we shall stage STANLEY'S RECORD BREAKER—the mount on which he has put up so many brilliant performances, culminating with the smashing of the ONE HOUR RECORD, when he covered over 67 miles within that time.

Also the Singer passenger machine upon which Harry Long covered 20,000 miles in 20 weeks, travelling with a passenger right round the coast of Great Britain and Ireland.

"There will be many things to interest you," and we shall be delighted to see you there.

If you cannot call, ask us for latest literature.

## Cyclecars and Sidecars.

**T**HIS issue is mainly devoted to passenger motor cycles of all types, and there is no doubt that very great interest will be displayed in light type three and four-wheeled passenger vehicles at the Olympia Motor Cycle Show.

In addition to the illustrations and description of modern runabouts which are published in this issue, we have dealt editorially with the evolution of cyclecars, and have proved that the cyclecar, so-called, is no new type, though it must be admitted that the design is not settled. There is a great diversity of opinion as to whether the ultimate cyclecar will take the form of a miniature motor car, that is, embodying the best car practice, or be a development of the motor cycle, *i.e.*, with an air-cooled engine and belt or chain drive. Time alone will show. We know that practically every motor cyclist owning a passenger machine and all prospective purchasers are wondering whether their next new mount is to be a sidecar, tricar, or four-wheeler; therefore a few criticisms of both types are opportune at the present time.

The sidecar as we know it now is light, speedy, and economical. On it have been tested practically all the various forms of transmission which are being fitted to four-wheelers, with the exception, perhaps, of gear transmission, although a trial of this is possible with one or two types of four-cylinder motor bicycles with sidecar. Taking first the oldest form, the belt, this has not been found absolutely satisfactory.

Chains, if they are to give perfect results, must be protected, and the latest forms of chain-driven sidecars have the chains running in oil bath cases. Friction drive has not so far been used commercially on sidecars, but has proved to be satisfactory on one or two types of runabout.

The introduction of four wheels has, of course, brought up the question of driving one or both rear wheels. Engineers tell us that when driving two wheels of a four-wheeled vehicle it is essential to use a balance gear to allow one wheel to over-run the other when turning corners. It yet remains to be seen whether a friction clutch method of attachment for one wheel will enable the balance gear to be dispensed with. Theoretically such a system should not give perfect results, but considering that the sidecar was looked upon when first introduced as a most unmechanical design and has yet proved to be not

only a serviceable but practical passenger-carrying vehicle, other principles which are condemned as mechanically wrong by engineers may prove in the case of light motor runabouts to be quite equal to the occasion.

We think readers will agree with us that it is in competitions like the Thousand Miles Trials that vehicles prove their capabilities; unfortunately we cannot refer to many of the runabout class which have shown themselves capable of serious touring. A few makers have had sufficient enterprise to enter them in hall-marked events, and all credit to those that have—they are bound to reap their reward. At the same time, it must not be overlooked that there have been during the last year or two a fair number of cyclecars on the market, and considering their number we have no proof that more than a few of them are capable of the same work as a well equipped sidecar. One advantage that a three or four-wheeler with a two-seater body possesses over a motor cycle and sidecar is that the driver as well as the passenger is protected from wet and mud. This is an advantage which would in many cases outweigh many disadvantages, and when a small difference in price is no object we can see a very big future for sociably-seated cyclecars.

For some time the motor cycle and sidecar will be considerably cheaper both in first cost and maintenance than three or four-wheeled runabouts. The reason for this is that motor bicycles are already standardised and can be made in quantities both economically and rapidly, and they can also be sold with or without a sidecar. The same remarks apply to sidecars. The reason why they are cheaper to maintain is because the combination of a motor bicycle and sidecar is lighter than most runabouts, and consumes less fuel. Last but not least, the sidecar combination provides two vehicles in one, and in many instances can be stored where a wider self-contained vehicle would be rejected on account of lack of accommodation.

In conclusion, we think that where storage space is sufficient and the owner does not wish to use a motor bicycle solo he will, if price be no consideration, purchase a cyclecar or small car. However, we anticipate even a larger demand for sidecar attachments next year, and although we are sure that a big number of runabouts will be sold, all who make them will be forced to prove their capabilities in open competition before the demand approaches that of the sidecar.

OCCASIONAL  
COMMENTSBY  
"IXION"**An Uaborn Run bout.**

The other day I ran into an elderly tradesman whom I have often tried to convert to the pastime, but in vain. I had a recent issue of *The Motor Cycle* in my hand, and I began to talk motor cycle runabouts for the rocks my arguments have always split upon in connection with bicycles were the familiar bogeys of side slip, dirtiness, cold, and starting acrobatics.

He informed me he had just returned from a trip to town, undertaken with the special object of inspecting and testing a cyclecar, but that he had returned without making a purchase. His idea was that at the present moment these machines stood exactly where motor bicycles were a few years ago.

The "spell of the knut," as he called it, was over the whole notion, and speed was the chief factor kept in mind by most designers. Speed means power, and power means price. "I shall buy a cyclecar for my work in a year or two," he concluded, "but it will not in the least resemble the machines I've been looking at to-day; I daresay these will survive, for there will always be fools who want to tear about at over 40 m.p.h. But the cyclecar of the future will be a small, light, low chassis with a  $3\frac{1}{2}$  h.p. engine, and I shall not pay a penny over £60 for it, perhaps less.

"It won't win hill-climbs or break records, and I daresay it would not get a gold medal in the Scottish Trials; but it will tote a nervous, middle-aged old jossler like myself over his business rounds in the undulating Midlands at very low cost. What the biggest public want is a four-wheeled edition of the lightweight bicycle, not a quadricycle caricature of Charlie Collier's racer."

I should not be at all surprised if my elderly friend proves to be perfectly right. Nevertheless the industry is working on the right lines.

Very few "nervous, middle-aged old jossers" will buy cyclecars in 1913, because years bring caution, and caution does not buy semi-experimental goods. The "knuts" will have to "try out" the auto quad, as it was the "knuts" who "tried out" the motor bicycle. When the runabout has made good, and has won its spurs in public, then the "jossler" class will begin clamouring for a cheaper, lighter, slower breed of four-wheeler; and the trade will tackle the demand in the light of some useful previous experience.

It will be very interesting to see what three years can evolve in the shape of a cheap, light, comfortable, single-seated runabout. With a big output of standardised models something rather sensational should be possible in the way of design and price, when the pioneers have educated the general public.

**Wear of Lightweight E. gins.**

From my budget of letters in reference to the above I select a typical example. Mr. W. Hutchison, of Paisley, has run a 1912  $2\frac{3}{4}$  h.p. twin for 5,800 miles

over Scottish roads, of which 3,200 were accomplished with a sidecar. His repair bill is as follows: Engine, gears, and belt, nil.; new fork springs, 2s. 6d.; new back wheel spokes, 1s. 9d.; new back tyre, 38s.; tyre repairs, 6s. 6d.; two new belt fasteners, 2s.

This is an excellent testimonial to the staunchness of the medium-sized mount, which was never designed to haul a passenger attachment. His experience—embodying a mileage of 5,800 from a single belt—confirms the testimony of many of my friends on the merits of the combined drive, but I am surprised it has lasted quite so long, and more surprised that his engine chain has put him to no expense. These details will be read with incredulity by many, and surpass the "previous best" quite easily. He finds that his  $2\frac{3}{4}$  h.p. is actually superior to the average  $3\frac{1}{2}$  h.p. in power maintenance; his engine bearings show no appreciable wear, and the carbonisation process is so slow that he actually had the temerity to start on a 600 miles tour with a sidecar when his engine was fouled by the carbon accumulated in 1,700 miles. He ascribes the freedom from carbon and the durability of his bearings to the drip-feed oiling.

He frankly states that in 1911 he would have mocked at the possibility of such experiences as are outlined above, but that the drip oiling has revolutionised an engine which was already excellent. I publish these details because they are likely to be challenged, and if they arouse controversy, sufficient evidence may be forthcoming to startle the makers who cling to the direct belt drive, and irregular lubrication, into initiating certain experiments. For a long time I have urged that combined drive and regular lubrication ought to be standardised on the typical British machine, and the more evidence we can elicit on such points the better.

**Magneto Controls.**

Perhaps the magneto control as it is often fitted is the worst back number on the average machine. The tank lever is an anachronism, and reminds us of the "twin tap" familiar in the half-forgotten age of the surface carburetter. With regard to fittings for controlling the contact breaker by means of a flexible wire, I have tried most types, and I have yet to find one which is absolutely wet and dirt-proof, while some have quite primitive "stops" for the wire casing on the handle-bar. My invariable procedure all this year has been to free and uncover the inner sliding barrel of the fitting on the magneto itself. After rubbing this clean I oil it carefully, and finally (as often as not) adjust the nut which holds the swivel at the top of the bracket. If the handle-bar lever be then waggled a few times the control will work well in dry weather and for half a day in wet weather, but towards the end of a wet run a retard generally means that the ignition cannot be advanced again unless the mechanism be re-oiled.

If the correct description of a cyclecar be a vehicle the chassis weight of which does not exceed 6 cwts., then instead of being recently discovered, as some would have us believe, it was practically the first born in the motor world. It has been, apparently, mislaid and recently detected, one might almost say stumbled across, since when it has been very much in the limelight.

**L**IGHT runabouts were very much in vogue about the year 1900, or even before then, if one include the three-wheeled variety. Leaving out such early types as the Benz tricycle and one or two others which were the first motor-propelled vehicles on the road, almost the earliest of the cyclecar type was the old Bollée tandem. This vehicle was practically

possible for a motor vehicle to be. The one referred to was the New Orleans. This little voiturette had a single-cylinder, air-cooled, vertical engine placed in front under the bonnet, and the engine was cooled by fans. The transmission was by belts, and the seats were sociably placed. Two of these vehicles took part in the first 1,000 miles trial and were favourably

Ariel quadricycle, built in 1899-1900.

Progress light car made in 1899, and which would now be regarded as a cyclecar

A two-seated Enfield four-wheeler of 1900.

the first to be commercially exploited in this country, and has been often introduced in *The Motor Cycle* on occasions when historical articles regarding motor cycle construction have appeared. The date of the introduction of the Bollée was 1896. Soon after its introduction the manufacture of the vehicle was taken up by Humbers and the Motor Manufacturing Co., the latter firm selling it under the name of the Coventry Motette.

#### Early Auto Quads.

Then came De Dion's motor tricycle, almost immediately followed by the De Dion quadricycle, which was nothing more than a tricycle with a forecarriage attachment. Licences for the manufacture of tricycles and quadricycles fitted with De Dion or De Dion type engines were taken out by various cycle manufacturing firms, among them being the Beeston Co., Coventry; the Ariel Cycle Co., Birmingham; and the Enfield Cycle Co., Redditch. Both Ariel and Enfield quads took part in the 1,000 miles trial of 1900, as also did several light vehicles built on motor cycle lines, which if in existence to-day would come under the cyclecar definition. The writer particularly remembers one British-made machine of this class which was as near the present-day cyclecar as it is

commented on by the judges. The Ariel quad, driven by Mr. J. W. Stocks, won a medal in its class, as also did the Enfield quad, entered by Mr. E. M. Iliffe, and on which the writer travelled through the trial.

Incidentally it is interesting to note that one of the

"Twelve years before its time." The Eastmead-Briggs worm-driven voiturette—a sociable-seated cyclecar.

The New Orleans. An air-cooled belt-driven miniature car of 1900. Mr. H. G. Burford at the wheel.

New Orleans voituresses referred to was driven by Mr. H. G. Burford, late manager of Humber, Ltd.

*The Autocar*, commenting on the performance of the two New Orleans, said "the very long and trying gradients did not appear to interfere with the effectiveness of the air-cooled motors."

Another vehicle in the trial, also of the cyclecar type, was the Century tandem, and one must not forget the  $3\frac{1}{2}$  h.p. De Dion voituress, certainly as much a cyclecar as any vehicle of the period.

#### An 1898 Model with Air-cooled Engine.

Leaving the 1,000 miles trial vehicles, one can recall the air-cooled Decauville voituress of 1898. This had a  $2\frac{1}{2}$  h.p. engine, and, leaving out the fact that the steering pillar was vertical and the body somewhat skeleton in design, it was a true cyclecar. One of these machines ran nearly 25,000 miles, between

The Crestmobile, a true cyclecar of American origin. It was illustrated in "The Autocar" of 1901, and had air-cooled engine, chain drive with two-speed counter-shaft.

June, 1899, and November, 1902, and in 1902 was still in the possession of its original owner.

The number of voituresses or light runabouts which were exhibited at the Paris Shows from 1900 to 1903 was legion. Many of them were enlarged and reconstructed quadricycles; we illustrate one which was called the Bailleau; it was exhibited in 1902. This was practically an evolution of the quadricycle, because it was driven by a  $2\frac{3}{4}$  or  $3\frac{1}{2}$  h.p. De Dion engine situated behind the rear axle just like a quad, and was sold complete with a change-speed gear and two-seated body for £96. Its total weight was 5 cwt. 3 qrs. 16 lbs.; with a water-cooled engine it weighed slightly more, and was catalogued at £104. We mention these prices and weights to show that the idea of weight and price for the ideal £100 motor vehicle was very much the same in 1902 as it is now.

A large number of small four-wheeled cars built on motor cycle lines have been brought out at various times between 1903, the first year *The Motor Cycle* was published, and the present date. Most of them have been illustrated and described in these pages, but to revive the memories of our readers we have reproduced two or three to illustrate this article. In the inscriptions we have appended the dates of publication, and

The Bailleau, built in 1902. It had an air or water-cooled engine (to order) behind the rear axle and a Bozart or other two-speed gear.

those who have files of *The Motor Cycle* in their possession will be able to read the detailed particulars. To republish pictures of every one of the runabouts which have appeared in this journal would mean many more pages than we can spare at this busy time. Therefore, we have only reproduced those which most nearly approximate to the present idea of a cyclecar in its tandem or sociably seated design.

As a proof that the belt drive was not only possible but practical in early days we publish a sketch on next page of the method of the belt transmission used on a French cyclecar, the Vinet. Several modern cyclecars employ flat belt transmission and very few have improved on the Vinet design exhibited in 1902.

Other small cars of about the same period were the Darracq, and the 6 h.p. De Dion Populaire; the latter was sold in Paris for £156. This excellently constructed and reliable little De Dion vehicle had a big run at home and abroad—in fact, the evolution of cyclecars would be almost completed by publishing a treatise on the De Dion vehicles from 1899 to date, commencing with the quad; then the  $3\frac{1}{2}$  h.p. voituress with engine at the back, followed by the 6 h.p. Populaire with engine in front, which was the last of

**The Evolution of Cyclecars.—**

the small motor cars made by this renowned firm and now withdrawn.

**What was Wrong?**

Whatever was wrong with the cyclecar type of vehicle about 1900 to 1904, it is safe to say that motorists as a body fought shy of small vehicles. True the 6 h.p. Rover had a good run about 1905

Plan view of the Vinet system of belt transmission made about 1901-2.

and later, and was a cyclecar when first introduced, but rapidly became a full blown motor car, as the requirements of customers were complied with and the strength and weight of the vehicle was increased to meet the conditions of bad roads here and abroad.

The introduction of the tricar perhaps prevented the development of the four-wheeled cyclecar type of vehicle. The tricar commenced with a motor bicycle and fore-carriage attachment, and gradually went through various stages until it reached its zenith in the form of a 9 h.p. twin-cylinder machine capable of speeds up to forty miles per hour. Some argue that increased power and weight were the death knell of the tricar; possibly true, but there were other circumstances which militated against its success.

It was neither so weatherproof nor so reliable as a small motor car, and the tandem form of seating was very much against it. As it died down the sidecar rose phoenix-like from its ashes, and up to recent times this form of motor cycle vehicle has been without a rival.

Talking of the phoenix, reminds us that this article would be incomplete without a mention of the Phoenix quad, a vehicle built by a firm who have been in the business from the earliest days, and who should know, if anyone does, what constitutes a cyclecar and when it was born.

The De Dion Populaire. This was the first of this famous range of models with engine in front—previous De Dion voiturettes were practically enlarged quads with engine at the back.

**The Revival of Small Motor Cars.**

The revival of the runabout type of vehicle commenced practically with the introduction of a French car, described at the time by one who has studied motor design from its earliest days "as a somewhat cheeky adaptation of the motor cycle engine and transmission to a four-wheeler." The particular machine referred to is the Bedelia tandem, an illustration of which was published in *The Motor Cycle* of September 8th, 1910. A good deal of the credit for the revival of the motor cycle type of runabout as a commercial proposition must be given to the French; although several forms of runabout have been made in England by amateur and professional engineers at odd times, nothing perhaps caused so much comment as the Bedelia.

The manufacture of these novel quads was commenced on commercial lines, and instead of being made in ones and twos, they were produced in quantities. Doubtless others may claim to have revived interest in the light runabout previous to the introduction of the French machine named, but we can trace the increased interest which has been taken in cyclecars from the date of the publication of the description and illustrations of the Bedelia.

The 9 h.p. Riley, which had a V. twin engine with cylinders at 90°  
It was made in 1908.

The daily press about this time went into rhapsodies over what it termed the "poor man's motor car," and generally speaking there has been a little boom from the date referred to up to the present time.

To infer that the introduction of the cyclecar has been due to any one journal, firm, or person is totally absurd, and any such claim can be dismissed at once. Further comment on such a ridiculous statement would be superfluous to anyone with the slightest knowledge of motoring history.

The Bedelia had not been on the market very long before the old objection was raised to the tandem form of seats, and copies of this ingenious vehicle sprang up in every direction, many with sociable seats. English designers got to work and dismissed the somewhat crude form of changing gear by means of different sized pulleys, and adapted the motor cycle variable gear by means of expanding pulleys to two-seated cyclecars. Others went further, and provided motor car gear boxes and either chain or gear-driven balance-geared rear axles. Some went in for water-cooled engines, and the very latest developments include a twin or four-cylinder water-cooled engine, three-speed gear box, and bevel-driven axle with a differential.

## The Evolution of Cyclecars.—

## History Repeating Itself.

The cyclecar movement has during the last year or two gone through the same phase as it did from, say, 1899 to 1904 with the exception that, instead of the single or twin-cylinder air-cooled three or four-wheeler becoming a four-wheeled water-cooled car of 15 to 25 cwt., it has developed from a belt-driven, air-cooled tandem or sociable into a gear or chain-driven water-cooled sociable of very light weight with a four-cylinder vertical engine.

Some argue that the last-named specification is not a cyclecar but a small car, and we are inclined to agree

The V.S. cyclecar exhibited at the Stanley Show of 1909. It had a 7 h.p. V twin air-cooled Peugeot engine. This photograph was reproduced in this journal on December 6th, 1909.

with them. The true cyclecar is one which embodies the characteristics of the motor cycle, and must naturally be of a lower-priced description, so far as cost of production is concerned, than that of a motor car. If a cyclecar be fitted with a four-cylinder engine, water-cooled, and all the adjuncts of a motor car, it cannot very well be produced for less than motor car prices, unless it be made in thousands instead of hundreds. The writer overheard two private-owner motorists discussing the subject of four-cylinder cyclecars which are produced and offered in the neighbourhood of £170, and the thing that puzzled them most

was that they had each paid over twice this figure for slightly larger cars which, in their opinion, ought not to have cost over 25% more, taking into consideration that only a little extra weight of material was used and the workmanship was approximately the same. They are still puzzling.

As our readers know, we have much competition in small cars in this country from the United States, where a full-sized motor car to carry four people can be sold for a sum much less than £200. Such vehicles are motor cars, and it remains to be seen whether those in search of a runabout which shall be more than a motor cycle, so far as comfort and weather proofness are concerned, will purchase a British-made small vehicle weighing about 6 cwt. chassis in preference to a larger heavier vehicle which will, in some cases, cost less and carry four passengers.

Of course, it is almost certain that it will cost more to run a four-seated Yankee runabout than a two-seated British-built cyclecar of the latest design. Firstly because the majority of the former have comparatively big engines for the weight they have to haul, and secondly because when they are supplied as four-seaters and occasionally two seats only are used they cannot be so economical as a 7 cwt. two-seated runabout. Another reason for increased maintenance is the fact that cars with large engines and only two speeds cost more to run than cars with smaller engines and a greater number of gear ratios.

In conclusion, we think we have shown that the evolution of cyclecars is to all intents and purposes the history of the motor car. What is called a cyclecar to-day was a motor car in 1900. For example, the 5 h.p. Humberette of 1903, the 6 h.p. Rover of 1905, Velox, 6 h.p. De Dion, and 9 h.p. Riley, all come within the cyclecar definition, and yet in their time were regarded as motor cars. If there is any novelty in connection with this type of vehicle it is the name only. Although we wish the revived type every success, it should not be forgotten that the motor bicycle is still and always will be the cheapest form of motor-propelled vehicle it is possible to make. This is a belief founded on the popularity of the pedal cycle, which remains the cheapest form of road vehicle ever invented. For this reason the addition of a sidecar renders the combination the cheapest motor-  
ing for two at the present time.

An amateur-ouilt four-wheeled cyclecar illustrated and described in "The Motor Cycle" of April 7th, 1910.

The original Bedelia propelled by an air-cooled V twin engine. From "The Motor Cycle" of September 8th, 1910.

## ACCESSORIES for PASSENGER MOTOR CYCLES.

It is scarcely possible to generalise about the right type of accessory for the cyclecar, because the design of the vehicle ranges from what is practically a four-wheeled edition of the 500 c.c. bicycle to a miniature duplicate of a Rolls-Royce. The principal factor in both the design and purchase of the equipment must invariably be lightness. The novice's temptation will be to imagine that since he has plenty of space he can add any luxurious fittings which attract him irrespective of weight; and to forget that a few bulky fittings will have the stopping effect of an extra passenger by dint of either weight or wind resistance. I append a few considerations, especially with regard to cyclecars.

### Wind Screens.

Heavy glass screens are ruled out by sheer weight, and by the fact that a transparent screen is intended to be used at a comparatively vertical angle, which will absorb 1 h.p. when forced against a breeze. Celluloid screens are too inflammable, talc screens are not really transparent. The wise cyclecarist will protect his lower person by a deep scuttle dash, preferably of leather or waterproofed fabric on light metal stretcher rods, brought well up to the top front edge of the steering wheel at a well-raked angle; or by a hinged and adjustable opaque screen of similar construction; and will trust to goggles and head wear and storm coat for shielding his upper storeys against inclement weather. The weight and wind resistance of a full-size, vertical screen are too big a handicap for a genuine cyclecar.

### Cape Hoods.

The Cape cart hood is outlined in classical mythology in the guise of a leather bag, in which the god Æolus kept the wind. A hood is all very well when you have 20 h.p. to push it through a storm with, but it is quite out of place on a light cyclecar. If bought, it should be regarded as a tent under which the passenger may seek temporary and stationary protection in a tropical downpour; but for actual travel in heavy rain, oilskins are infinitely preferable. A proper hood would stop a genuine cyclecar down to a crawl in rough weather; if we pile on enough power to push a gipsy van at 20 m.p.h. against a gale we shall kill the cyclecar by over-development.

### Lamps.

The cyclecar will travel as fast as a biggish car, and it needs penetrating illumination. My own plan is to carry one centrally mounted 6in. head lamp, fed by two small motor cycle generators, so saving 50% on the weight of an ordinary four-wheeler lighting system. The same generators will simultaneously feed two baby acetylene head lights, little larger than turkey's eggs; or some may prefer a brace of miniature electric side lamps, which save messing up the generator for a five-mile run in the dusk. Long experience in the wiles of tail lamps has made me an enthusiast for the "Dependence" type in a smaller size.

### Toolkit.

An extended toolkit is advisable for a vehicle which has springs and other parts which may require lusty handling, and my plan is to buy one of the big tool-rolls, costing 30s. or so, and empty its contents into a small leather handbag of the kind in which running men carry their spikes, zephyr and shorts. If a duster is stuffed in on top of the tools they will not rattle, and are easily accessible. Delicate spares should be separately stored. The toolbag reposes handily under my thighs on the floorboards.

### Hooter.

A really penetrating alarm is very serviceable, especially on cyclecars provided with only two gears, which cannot easily be got back on to top gear when baulked half-way up a longish rise. Exhaust whistles have to be carefully used in these days of new laws, but their penetration and lightness make them very suitable, if they are courteously used, and not employed in the vicinity of police or population. Otherwise an electric horn is very good. The modern electric horn possesses a reliability which its predecessors never boasted, and its one drawback is the need of carrying a special accumulator or dry cell for it.

### Personal Luggage.

In respect of luggage the cyclecar should be regarded as a glorified motor bicycle, and stern self-restraint is advisable. Of course, if a lady be the passenger, some leniency will be compulsory. In this case the tailboard is the correct location. Placed there a suitcase entails no extra wind resistance, and its weight will make the wheels bite on greasy hills; but it is wise to buy her a special suitcase, and 15s. will purchase a featherweight waterproof case of flattish outline, and large enough to house a sufficiently killing toilet.

B. H. DAVIES.

HANDLE OR KICK STARTER.

Our photograph shows a combined hand and kick starting apparatus fitted to a 6 h.p. Rex two-speeder, and for which a patent has been applied for. It consists of an encased ratchet running in an oil bath and having a recess for a copious supply of oil. It was designed by W. R. Cooke, of Nottingham.

## ACCESSORIES.

Some Novelties for the  
Olympia Motor Cycle Show

A. C. Davison, 163, Arlington Road, Camden Town, N.W., the well-known manufacturer of tanks, filler caps, gauges, and pumps, has lately introduced an ingenious and simple sight feed lubricator, which works in conjunction with his tapless oil pump. The lubricator consists of a glass reservoir containing a certain quantity of oil, which is allowed to flow by gravity into the engine, the flow being

Davison patent continuous sight feed lubricator.

controlled by means of an adjustable needle valve.

If the tapless oil pump be filled and the handle depressed the oil normally passes from the tank by means of the pump into the glass reservoir, and the lubricant will now feed by gravity into the engine as fast as may be desired, according to the adjustment of the needle valve. Should, however, it be required to inject a pumpful immediately, the lever on the top of the drip feed must be pushed over to the left. This slides up an inclined plane, lifts the needle valve off its seating, closes the air vent, and allows a full pumpful of oil to be delivered to the engine. The amount of oil in the glass reservoir does not matter in the slightest, as the air vent being closed there is an air cushion behind a quantity of oil, and even though the reservoir be half full this quantity will remain unaltered and a full pumpful be delivered to the tank.

Mr. Davison has lately taken up acetylene welding, and is undertaking the repair of broken cylinders, crank delivered to the engine.

Brown Bros.' grease injector for filling gear boxes. The top of the syringe is ball shaped, allowing the plunger to be easily pushed home.

An ingenious and useful attachment for fixing on to the filler cap of a petrol can will be exhibited by the Safety Petrol Filler Co., Ltd., 20, Vic-

A filter for attachment to petrol tins.

toria Street, W. This enables the liquid to be poured out freely, and at the same time filters it by means of a strainer. The device possesses a nozzle of small dimensions, which is detachable, so that the gauze therein can be easily cleaned. It is also ingeniously fitted with two threads, so as to fit petrol tins with large or small orifices. The company is also making a speciality of a material known as CyKling, which is a preparation claimed to prevent belt slip on either rubber or leather belts. When used on the latter it acts as a preservative. Each block is packed in a neat box holder.

Several improvements have been made in the Watford speedometers, made by Messrs. Nicole, Nielsen, and Co., Watford, for 1913. These instruments are made with the greatest accuracy and

The Watford speed indicator, with watch attachment below.

care. An innovation will be a motor cycle speedometer registering in kilometres, which should appeal to foreign riders, with trip registering up to 999 kilometres. Up to the present time, the Watford speedometer has not registered

the tenths of a mile; but this innovation will be introduced into the 1913 models.

Another novelty will be a Nicole-Nielsen watch to attach to the handlebar. This is sold in a well-made case. The case is a particularly neat and well-finished job, and, being free of flutings and projections, should be easy to clean. The clip by means of which it is attached is similar to that used on the speedometer, and is secure and ingenious.

A speedometer model has been introduced, in which a match case is attached to the complete instrument. In the mechanism itself the chief alteration is

Back of Watford machine watch, showing simple and effective method of attachment, which is also used on the Watford speedometer.

the introduction of worm drive for rotating the registering mechanism off the governor. Formerly a ratchet drive was employed, and, while this was quite satisfactory and possessed the advantage of always registering in the forward direction irrespective of the machine being wheeled backwards, the worm drive has been found to be better and to give a more accurate reading.

The Forward sparking plugs, belt fasteners, etc., will be found on some of the accessory stands. The principal novelty for 1913 is the patent steatite plug. This is made with a solid nickel rod and heavy nickel points. The steatite insulator is held in place by hermetic cement, which, it is claimed, is unaffected by heat. At the base of the steel body is a copper washer on which is seated a detachable sleeve containing the cement and steatite. It is, therefore, possible, by undoing the sleeve, to remove the insulator and the nickel rod complete from the body of the plug. This is claimed to be a revolution in sparking plug construction. The Forward Cycle Company, Edmund Street, Birmingham, also make other types of single, two and three point plugs, and plug holders, also the Forward ejector sparking plug, particulars of which have already appeared.

## There's the Saddle—

of all fitments responsible for your ease  
and comfort more than any other, and—

## Among the Accessories.—

The Continental Tyre and Rubber Co., Thurloe Place, South Kensington, S.W., will be showing their standard De Course model, which remains as before, though the tread is now made slightly heavier. The well-known basket pattern will be retained, and the rubber-

The Continental heavy rubber studded tyre, studded pattern is now made in all sizes. A heavy combination type has been introduced, while 28in. x 2½in. tyres are made for Indian and other machines with 28in. wheels. The combination is also made in the 700 x 80 mm. size for A.C. and other cyclecars. For sidecars, the well-known Autobi tyre will be retained, also the rubber non-skid and the steel-studded. The exhibit will also include Continental belts of all sizes and the various rubber accessories made by the firm.

The Rom Tyre Co., 31, Brooke Street, Holborn, E.C., will exhibit two new covers—650 x 65 mm. and 700 x 80 mm.—for fitting to voiturette rims. These will be provided with square treads, and are intended for those motor cyclists who use sidecar machines or cyclecars and do not require non-skid tyres. They possess a very heavy tread, and should be most durable.

The Rom square tread voiturette tyre.

The firm is also specialising in a 3in. tyre of the well-known combination rubber bar and steel studded pattern to fit motor cycle rims. The combination tyre in many sizes and Rom belts will also be on view.

There is little doubt that the accessory exhibit of Alfred Dunhill, Ltd., 359 361, Euston Road, N.W., will be a most interesting one. Among the novelties we may mention a ball-jointed handle-bar

mirror, which can be so adjusted that the light from the lamp may be reflected back on to the machine, thus enabling a tyre to be repaired or other adjustments effected after lighting-up time. A very handy little accessory is the pocket petrol filter and case. Quite a novelty, and a speciality of Messrs. Dunhill's, is a chrome leather band designed to be inserted inside the cover and between it and the tube. It is practically unpuncturable and has been tested by several riders on the flinty roads of Norfolk with considerable success. It is easily fitted, and only needs a slight application of solution just to hold it in place while it is inserted, after which the air pressure will keep it in position.

Another simple but handy accessory which should appeal to many who have not a proper motor house in which to store their machines is a grease tray, which, if the machine is left in the hall, may be placed underneath the crank case

Dunhill's handle-bar mirror, which can be used to reflect light on any portion of the machine needing adjustment after dark.

to catch oil drippings and keep the floor covering clean.

Another novelty is a match and cigarette holder for fixing on to the handle-bars.

Motor cycle garments of all kinds and types will be on view, while amongst the novelties in this department will be a sack rug for sidecar passengers. It is made of plush, is very warm, and is fastened round the body by the aid of glove button fasteners, and therefore, easily donned and doffed. Another novelty is a camel fleece smock, which takes the place of a coat lining, so that even if a light thin coat be worn the

Dunlop Pillion tyre for passenger machines.

rider is sufficiently protected from the cold.

An interesting accessory will be the Kerry motor cycle lamp, marketed by the East London Rubber Co. This is fitted with a special bracket, so that the lamp can be turned up and down or

Kerry foot muf.

turned completely round so as to facilitate repairs after dark. Another novelty will be a toolbag fitted with a recess for each tool; this is held in position by means of springs so that rattling is impossible. The East London Rubber Co. also make a speciality of a sidecar stand. As regards clothing, a novelty is a sidecar foot muf made in two styles—square for the ordinary basket, or V-

The Kerry camel fleece under-jacket.

shaped for the canoe type of sidecar body.

A very useful article of clothing is or may be worn loose under a thin coat, a camel fleece under-jacket, which is made so that it may be attached by means of spring buttons to an overcoat, or may be worn loose under a thin coat. Another very useful article of clothing is a waistcoat lined with beautifully soft chamois leather, and possessing Italian cloth sleeves lined with the same material. The firm will be showing the "Shackleton" cap, of which we have already made mention: it is lined with fur, which can be unfolded and serves to keep the ears warm. A double-breasted oilskin coat with a storm fastening, which is absolutely impermeable to wet, will also be shown among other articles of clothing.

(To be continued.)

## Sporting Quadcars.

H. E. Dew's latest spider quad, side and front views. This single seated four-wheeler is propelled by a twin-cylinder engine.

L.M.

This neat design of four-wheeled cyclecar, previous models of which have been described from time to time in *The Motor Cycle*, and of which we reproduce a photograph of the latest model, has, practically speaking, undergone no

Three-quarter view of the latest L.M.

alterations outwardly, but at the same time it has been considerably enhanced in its general appearance. From front to rear, the mechanism may be described

as follows: The engine is of the well-known 8 h.p. J.A.P. twin type, fitted with B. and B. carburetter and Bosch high-tension magneto. From the engine the power is transmitted by Renold chains to the clutch and two-speed gear box mounted on the counter-shaft. Thence, the drive is again by chain to a live back axle fitted with differential gear. Adjustment is provided for both chains, and a point worthy of notice is that the engine may be started from the driving seat. The complete vehicle, which is well-sprung fore and aft, and weighs approximately 5 cwt., fitted with Auster hood and screen, presents a smart appearance. All four wheels are shod with 26 x 2 1/2 Michelin tyres. Three inch tyres are fitted as an extra.

GORDON.

A visit to Mr. Gordon Armstrong's works at Beverley revealed many improvements to the Gordon cyclecar, the first example of which was made three

The power unit of the Gordon. The engine is a J.A.P., with cylinders at 90°. Three inch tyres are

years ago. The engine now used is the 8 h.p. J.A.P. with cylinders at 90°, 85 x 95 mm. bore and stroke, giving a cubic capacity of 1 078 c.c. This engine is much more vibrationless than that fitted to previous models. Chain drive and a three-speed and reverse gear box have been standard for the last two years, and have proved most satisfactory. The Ferodo lined brakes are very powerful and smooth in action, either foot or hand brake being sufficiently powerful to hold the machine on any hill. The engine is started on accumulator ignition and afterwards switched over to the magneto. Two large fans are used for cooling purposes, one to each cylinder. The framework of the body is very novel, being built of tubes with the chassis; the seats are on the hammock principle and very comfortable. In a trial trip of 800 miles in the Lake District and Scotland, the car performed exceedingly well and climbed Kirkstone Pass on second speed.

The Little Indiana four-wheeled single-seated machine with central steering.

**8 h.p. WILLIAMSON.**

The Williamson has been designed from start to finish as a sidecar machine, and the engine, frame, and transmission are all of sufficiently robust proportions to withstand the extra strain. At the same time, it must not be imagined that it cannot be ridden solo. We ourselves have enjoyed a very comfortable solo run on an air-cooled model. The engine is manufactured on the well-known Douglas lines; that is to say, it has two horizontally opposed cylinders with the connecting rods actuating opposed cranks. A large outside flywheel is fitted, which adds materially to the smooth pulling. The engine has a capacity of 964 c.c., and is rated at 8 h.p. It can be had in either water or air-cooled models. The engine is connected to the two-speed gear box by chain, and the drive to the rear wheel is similar. The gear box is a strengthened replica of the Douglas, and a leather-to-metal cone clutch is employed.

In future models a spring drive will be fitted to the rear wheel to absorb transmission shocks. (This device was described and illustrated in a recent issue of this journal.) The frame is of peculiar construction, most of the tubes being in duplicate. The saddle gives a particularly low riding position, and long footboards add to the comfort and appearance of the machine.

26 x 3in. tyres are fitted, the tank has a capacity of one and threequarter

gallons of petrol and half a gallon of oil, and standard gear ratios are  $4\frac{1}{2}$  and 7 to 1. The whole machine has an unusual, but businesslike, appearance, and the engine runs with that pleasant absence of vibration which is common to the horizontally opposed twin.

they have decided upon very few alterations for 1913. The following machines will be on view at the Show: A three-seater painted cream, fitted with hood, screen, and all accessories; a two-seater painted standard green, without extras; a two-seater painted blue, fully equipped

1913 model A.C. sociable, the chief alteration to which is the lengthened wheelbase.

**A.C. SOCIABLES.**

The manufacturers of the A.C., Auto-Carriers, Ltd., Thames Ditton, are so well satisfied with the present models that

with all extras; a two-seater fully equipped, painted grey; and a two-seater painted silver grey. It is certain that the finish of the A.C. sociables will appeal to all tastes. An interesting exhibit will be an unpainted A.C. fitted with De Luxe body, showing the material

The latest model of the 8 h.p. air-cooled Williamson, with Canoelet sidecar.

Front view of A.C. sociable. Attention is directed to the inside extensions to the mudguards.

and workmanship of the coachwork, which is carried out entirely at the company's works. All the 1913 models will be of the De Luxe type, and will be fitted with the latest type of engine, which has a bore of 95 mm. and a stroke of 102 mm

Front and side views of the latest friction-driven Crescent.

### CRESCENT.

In our issue of October 31st we dealt, briefly, with the mechanical features of the Crescent friction-driven cyclecar, and now we reproduce photographs of the latest model complete with sociable body fitted with hood and screen. These illustrations convey a good idea of the very smart appearance the complete machine presents, and we can testify that the finish is as good as the general appearance. The lines of the machine are particularly pleasing, there being no abrupt breaks in the body line; and it is evident that comfort has been studied hand in hand with appearance. Points worthy of note are the toolbox at the back, the wide entrance, and the neat manner in which the bonnet hinges forward allowing easy access to the twin air-cooled J.A.P. engine. The acetylene head lamps are carried by brackets fixed to the front mudguards. They therefore show the extreme width of

the car and do away with the necessity of carrying side lamps. This is a good point, provided the mudguards are well-braced to the frame and the lamp brackets firmly fixed to the mudguards, as is the case in this instance.

### CHATER-LEA.

The latest Chater-Lea cyclecar chassis, which we were privileged to see recently, is a production well worthy of the firm responsible for its construction. The whole is designed and built on sound and well-tried lines, and there is nothing experimental about it.

The frame is of channel steel, strongly stayed by means of tubular cross members, inswep at the front, so as to provide an ample lock, and is suspended on semi-elliptical springs fore and aft. The 85 x 85 V twin Chater-Lea engine is set transversely in the frame on special brackets, and is supplied either air or water-cooled.

The cone clutch is of the ordinary leather-to-metal type with external springs, rendering adjustment easy. Between clutch and gear box there is a sliding joint forward and a flexible joint at the rear. The connecting-shaft between clutch and gear box is in two pieces, so

The Chater-Lea cyclecar three-speed and reverse gear box, and external Ferodo lined brake and universal joint.

that by undoing the joint in the centre the clutch may be conveniently withdrawn.

The gear box has been improved in design, and now provides three speeds and reverse, while the change is effected through a gate. Behind the gear box on the gearshaft there is an external brake of approved design, with a simple means of adjustment.

The forward end of the propeller-shaft is fitted with a universal joint of the pin type, while at the rear there is a hexagonal sliding joint. The final drive is by over-head worm. No torque rod is fitted, the torque being taken by the springs.

The front axle is tubular, and the steering pins are provided with ball bearings. The steering is direct, a system which Chater-Lea, Ltd., have found to be perfectly satisfactory.

The radiator designed for the water-cooled model has been photographed, firstly, to show the method of carrying it; and secondly, to depict the door in the centre through which is obtained easy access to the valves. The air-cooled

Front view of Chater-Lea cyclecar chassis, showing new radiator with centre door for allowing easy access to valves. The radiator is here shown on an air-cooled chassis merely to denote the manner in which it is fixed.

New Chater-Lea No. 7 sidecar frame showing method of carrying three-speed gearbox and magneto.

model will probably be provided with a cylindrical tank over the engine, with gauze at the sides to allow for good air circulation.

As regards control. The throttle and air levers are on the steering column. The brake pedal operates the internal expanding brakes on the rear wheels and the side lever the gearshaft brake.

The latest No. 7 Chater-Lea sidecar model has a frame with special brackets behind the bottom of the saddle tube on which the magneto and gear box are carried. That provided for the gear box is slotted so that the chains can be easily adjusted.

## AUTOTRIX.

Three designs of the Autotrix are standardised by Edmunds, Wadden and Co., Weybridge, namely, an 8 h.p. water-cooled, 8 h.p. air-cooled, and a 6 h.p. water-cooled, the first two involving the use of J.A.P. engines, the latter of a Fairair.

The 8 h.p. water-cooled car, with body a little larger than the standard, is a very different vehicle from that shown at Olympia last year.

This is true, not only of the body, but of the chassis. The special features that the designers have endeavoured to secure are comfortable seating accommodation for two, good leg room and weather protection, coupled with efficient and comfortable springing, and particular attention has been given to the last point, for it is especially upon the springing of the back wheel that the makers consider the success of the three-wheeler depends.

Accordingly, in this registered design, the springs are so constructed as to be effective with a great variety of shocks, from the smallest to the largest, the smaller being taken up by the longer part of the spring, while the shorter part only comes into operation when certain stresses are exceeded. It is claimed that this effect can be obtained without allowing the back wheel to cant when rounding corners or on highly cambered roads: consequently no trouble is experienced with the chain getting thrown out of alignment.

6 h.p. P.D.A. cyclecar, which has two speeds and is shaft-driven.

One model is built for commercial travellers' use, a class of work to which the makers are giving considerable attention, and for which there is certainly a demand.

The latest Autotrix three-wheeler, with radiator on dash.

## BEDELIA.

The general specification of the Bedelia is probably fairly well-known. In the case of the two-cylinder models duplicated steering cables are now fitted, and the possibility of backlash reduced to a minimum. A different design of brake is also now fitted to the counter-shaft.

It is worth noting that in the two-cylinder engine (the bore and stroke of which, by the by, are 80 x 100 mm.) the cylinders are set at an angle of 90°, which enables a very good balancing effect to be obtained about as good as it is possible to obtain in a twin-cylinder V-type engine.

Singer new design of bottom bracket for pedalling gear on the 4½ h.p. machine.

The proof of the pudding is in the eating, and although we have not tested the Bedelia engine for absence of vibration with the system of balancing employed, we can well believe the claim made by Mr. L. N. Palmer, that a glass full of water can be placed upon the petrol tank immediately over the engine when running without any of the water getting spilt, and articles may be placed on the wings while the engine is running quite fast and yet not be shaken off.

The front suspension has been improved, so that a lateral motion is provided to enable the chassis to accommodate itself to almost any road inequality that can be

## G.W.K.

One of the finest cyclecars of the season has undoubtedly been the G.W.K., made by G.W.K., Ltd., Datchet, Bucks. This is one of the few vehicles of this type which has consistently proved its worth in various reliability trials and competitions. So successful has it been that the makers have decided to make no startling alterations, but to pay attention to a few details in which improvement might be effected.

For example, the rear axle is now made of special nickel chrome air-hardened steel with a tensile strength of 120 tons. They have done away with all

Component parts of the A.J.S. free engine clutch which has cork insets.

cone type ball bearings, their place being taken by ring type bearings. Riley detachable wheels are employed, and the brake drums have been enlarged. The chassis has been generally strengthened where necessary.

## Brough Cyclecar.

The Brough firm are manufacturing a cyclecar which has a twin-cylinder 85x95 engine driving a three-speed gear of the sliding dog type by chain, another chain transmitting the power to the rear axle, which has no differential. The body is coach-built, and the chassis is sprung on semi-elliptical springs throughout.

A 1913 Bedelia cyclecar, with hood and wind screen.

surmounted by wheels. This is effected by a special form of shock absorber contained in a box underneath the coil spring that is enclosed in the brass telescopic casing.

It is doubtful whether the new models will be ready in time for the Show, but, in any case, the Bedelia exhibit will be an imposing one, comprising among other things, two models, each fitted with a distinctive magneto—the one of the new Alterno type, the other a new Gibaud, both, of course, specially designed to fire cylinders at 90°.

## G.N.

G. N. Higgs and Co., 31, Vauxhall Bridge Road, S.W., will exhibit G.N. cyclecars solely. Among the exhibits will be a polished chassis, which should attract a great deal of interest, as it will be a novelty among cyclecars. It is interesting to note that Mr. Higgs was

one of the earliest cyclecar users in England. His experience, therefore, in the construction and handling of these vehicles is probably unequalled. The G.N. runabout is fitted with a twin-cylinder 80 x 98 mm. engine, with the cylinders set at 90°. The engine is slightly out of the common, in that it has a long outside bearing to the crankshaft, a big external flywheel, and the timing gear in a separate unit. There are only two timing wheels, two cams, and four rockers operating the valves for each cylinder. The inlet valves are of the overhead mechanical type, operated by ball-ended tappet rods. The fan is mounted on a hinged bracket, the hinge allowing the fibre friction wheel to be held against the flywheel by means of a spring. The transmission is by chain to the counter-shaft, on which is mounted the two-speed gear, and thence to the back wheels by belts.

## NEW SWIFT CYCLECAR.

This machine was described and illustrated in our last issue. It has a 6 h.p. twin-cylinder engine, three-speeds, shaft drive and tubular frame.

## INVICTA RUNABOUT.

The Invicta is a very smartly designed cyclecar made by Mr. H. E. Clarke, of Clarendon Square, Leamington. We recently inspected one of these machines and found Mr. Clarke busily preparing an example of the Invicta for exhibition. The engine, an 8 h.p. J.A.P. water-cooled, 85 x 85 mm., drives through a leather-faced cone clutch and propeller-shaft to a three-speed Chater-Lea gear box. Thermo-syphon cooling is employed and the water pipes are very large.

The handle starter is geared up by means of a skew gear, thus enabling an easy start to be made. We agreed with Mr. Clarke that handle starting on small twin engines with magneto ignition was rather uncertain unless a gear were employed. In addition to gearing up the

Broadside view of the Invicta.

Front view of Invicta runabout.

starting he has fitted an exhaust valve after which operates by Bowden wire and lever, the latter being attached at the corner of the frame.

The Bosch magneto is bevel driven off the timing shaft. The gear box provides three speeds and reverse, with direct drive on top gear. A universally jointed shaft runs between the gear box and clutch shaft, and also between gear box and bevel cross drive, which is on a counter-shaft behind the gear box. From this cross-shaft to the rear axle the drive is by a single chain. The live rear axle evolves in Skefko bearings attached to

the spring boxes, and only one wheel is keyed to the shaft, the other being connected by a friction clutch plate in the hub. A strong spring holds the friction clutch sufficiently tight to prevent the wheel from slipping when the vehicle is travelling in a straight line. When it is turning a corner it is claimed that sufficient slip takes place to enable one wheel to over-run the other, and so dispense with a balance gear.

The springs are quarter elliptical, and torque rods are provided front and rear, the latter being adjustable to allow for chain stretch. Two external brakes are fitted to the back wheels and one on the counter-shaft behind the gear box. The two former are operated by side hand lever and the latter by pedal. The clutch is also pedal operated.

The main frame is of wood with inside angle plates, the cross members being tubular and brazed to lugs bolted to the frame. There are four ordinary cross members, to two of which are attached the gear box and cross counter-shaft. The front cross member is of angle steel and on it is fixed the geared starting handle, etc. The engine is supported by a sub-frame of tubing, and the same sub-frame supports the gear box.

Steering is by rack and pinion; the tanks for petrol and oil are concealed in the dash, as also are the oil pump and drip feed lubricator.

One of the simplest things on the vehicle is the quadrant for the gear change lever. No gate is employed, and

yet it is almost impossible to make a mistake in changing gear. The silencer is of large dimensions, divided into four compartments with the holes decreasing in size towards the end, the final exit of the gases being through a single pipe with flattened end. The torpedo-shaped body is upholstered in leather, and all body corners are nicely shaped off. At the rear a large luggage grid provides ample space for touring bags; underneath it is a box for spares, the top being finished off with a rubber mat. The wheelbase is 7ft. 9in., track 3ft. 11in., and the chassis weight under 6 cwt.

## MONTGOMERY.

Montgomery sidecar improvements include cantilever springs in place of the ordinary cee springs; these are very sensitive, have an increased range of action, save 5 to 6 lbs. in weight, and are readily adjustable to accommodate passengers from 8 to 14 stones.

There are also new attachments fitted with double security locks, and

Cantilever springing on the new Montgomery. A spiral spring is enclosed in the tubes.

Unbreakable trussed frame on the Montgomery.

providing adjustment for bringing the sidecar axle parallel with the ground, and also in perfect alignment with the bicycle. This is a most important improvement, because the sidecar wheel can be made to run perfectly upright (even if a 26in. wheel sidecar be used with a 28in. bicycle wheel, or *vice versa*). Perfect alignment adds considerably to easy running, removes fear of spindle breakage, and distributes the weight evenly on both springs instead of straining the spring nearest to the bicycle.

Plan view of chassis of Clarke's Invicta runabout.

## 1913 Models.

The frame has received special attention, and a new design produced, strengthened in every part, and strong enough for use with the highest powered motor bicycles.

The hub has been made rain and dust proof, by providing the mudguard stay bracket with a flange which half encircles the hub and extends as near as possible to the spokes.

Method of securing Humberette rear wheels with a cotter pin.

The luggage capacity has been improved by providing a sprung grid which accommodates a two-gallon can of petrol, tool box on the lower part, and a specially made valise on top.

The front extension and lateral adjustment of the frame, used for the past ten years, is retained, although

A Montgomery sidecar feature. Adjustment for height of rear portion.

strengthened in all parts to meet the requirements of high-powered machines and fast speeds.

Special attention has been given to the bodies, both in coach-built, cane, and wicker work; deep seats, low backs, and ample leg room being special features. Weight has been considerably reduced.

The automatic lubricating system on the new Swift cyclecar. See last week's issue, pages 1264-1265.

A fine example of the Humberette, which has an air-cooled engine, three-speed gear, and shaft drive.

An experimental wind-propelled light car, built by the Beacon Engineering Co. A 3 h.p. J.A.P. engine drives the propeller. A fair speed is possible on the level, but on hills the car is not such a success.

This handsome design of cyclecar may have been seen by readers in the Midlands. It is to make its first appearance at Olympia, but at present we may not divulge its name.

Broadside view of the 8 h.p. Autocrat.

## THE AUTOCRAT.

The Autocrat is the production of Mr. W. Ivy Rogers, trading as the Autocrat Light Car Co., Gough Road, Birmingham. The chassis is of channel steel, upswept at the back, while the front axle is dropped, giving a low centre of gravity. The frame

Front view of the Autocrat.

is carried on semi-elliptical three-leaf springs. The 8 h.p. J.A.P. engine and transmission up to the gear box are carried on a sub-frame of angle steel, secured to three tubular cross members, which also carries the clutch control mechanism. A fan (not illustrated) is fitted to assist in cooling the engine. The transmission is by shaft to the gear box, thence by chain to a balance geared back axle. The gear box is

of the sliding gear type, and a gate change is fitted. The clutch is of disc pattern, with one central disc leather-faced on both sides, and is so constructed that there is no thrust on the engine-shaft or gear box pinion. A universal joint connects the propeller-shaft with the engine-

Design of the Wilton Cycle and Motor Co.'s sidecar chassis.

shaft. Steering is effected by rack and pinion. The lubrication is by automatic adjustable drip feed from the dashboard. The petrol tank contains four gallons, and

the petrol consumption is about 40 m.p.g. Accessibility to all parts has been aimed at, and Amac, Lukin, or Binks carburettors are fitted to order. Two brakes are fitted to each rear wheel, one internal expanding and the other external contracting. The wings are shrouded, and there is a long step board. The wheelbase is 7ft. 6in. and the track 3ft 10in.

The body is of taking appearance, with a long dashboard, and is upholstered throughout in real leather. It seats two, and there is ample leg room for tall persons. The brake and gear levers work inside the body. At the rear is a luggage box with a hinged lid, which for a slight extra cost may be fitted as a dicky seat. 650 x 65 mm. tyres are fitted. The weight complete as given to us is 7 cwt. and chassis weight 6 cwt.

A four-cylinder water-cooled model is also made, in which the same design is observed.

## WILTON SIDECAR.

The speciality of the Wilton Cycle and Motor Co., Wilton Road, S.W., is a

The latest type of Rollo cyclecar, with tandem seats.

sidecar of their own manufacture, which possesses a rectangular frame; the chief point in its construction is the use of an additional stay from the centre of the forward part of the frame to a special fitting, which clamps round the lug and tube of the diagonal member of the motor bicycle. The springs are in two parts, one portion being above the frame and the other below. The lower one carries the footboard, which is fastened by a butterfly nut. The attachments are conical pegs on the machine, fitting into conical holes on the sidecar frame, the whole being secured with the aid of a nut. The bodies for this sidecar have been carefully selected; one in particular is provided with a patent leather body, which substance has been found to wear better than the ordinary coach finish. It is fitted to a sidecar known as the "family" model, and has a child's seat in front. Stern aprons are provided with back extensions to fit over the shoulders, or completely to cover in the body of the sidecar when empty. The latest pattern single-seated bodies are gracefully swept away underneath, thus giving ample room for a tool box below the seat.

The G.N. runabout, a racy looking belt-driven machine, fitted with a twin-cylinder engine. The G.N. was one of the earliest cyclecars.

The experimental Douglas, which has an 8 h.p. horizontal engine. It will not be exhibited at Olympia.

## QUADRANT.

The new 7 h.p. twin engine which this firm is making for the coming season has already been described in *The Motor Cycle*, and the following notes relate to the rest of the machine.

As this model is intended for sidecar work, permanent lugs are attached to the frame. A chain drive is employed with a two-speed gear forming the counter-shaft. It works on the double-clutch principle, and gives a direct drive on both gears. The chains are completely enclosed in oil-bath cases, and the gear is controlled from the top of the tank by a gear lever supported by the top tube. The one end of the counter-shaft is contained within a hole cut in the wall of the chain case, so that the adjustment of the gear can be carried out without taking this off. In order to make the case dust proof, an aluminium disc cast integrally with the footboard is made to register with the hole, making a very neat and readily accessible fitting. Best and Lloyd drip-feed lubrication is furnished, whilst the specification also includes a Bosch magneto and any of the leading makes of carburetter, at purchaser's option. The petrol tank holds two gallons of petrol and three pints of oil.

650×65 heavy tyres are fitted to both wheels, whilst the mudguards are also of sensibly large dimensions. A new type of spring fork is used which

follows the original Quadrant design, but is furnished with an additional spring for taking up the rebound. The sidecar chassis, which has been specially designed for this machine, is four-point suspended. Special rails are provided on the back of the sidecar body to allow a spare tyre to be carried very con-

The Supreme sidecar. This coach-built sidecar is constructed of three-ply birch; no metal is used in the framework. Note the step for the use of passenger.

veniently. No carrier of the ordinary kind is fixed on the back of the machine itself, but instead a very large one is attached to the sidecar.

The Quadrant Co. will have at the Show a 3½ h.p. model fitted with a three-speed Humphris gear. This is a very interesting form of transmission, in which each of the gears is direct. Three

equal sized driving pinions with specially formed spherical teeth mesh with three concentric rings of spherical holes in the driven plate attached to the hub, the whole being enclosed in a weather-proof case.

The 4½ h.p. standard machine with a bore and stroke of 87×95, and fitted with overhead inlet valves, will also be shown. A T.T. model will be on view.

## SCOTT.

There are no radical alterations in the Scott, but several minor improvements to details. For instance, four-point attachment lugs for sidecar are brazed into the frame; the tank filler is no longer on the steering head, but a special filler is incorporated with the saddle lug, which makes the filling of the oil tubes an easier matter; the chain sprockets are so fitted that they can be exchanged for solo or sidecar work without removing the change speed gear; the engine is made with air-cooled heads, thus effecting a saving in the size of the radiator and weight; the lubrication system is improved; further improvements have been made to the spring fork; the tank is now leather-covered, which enhances the appearance of the machine; and the chains are entirely hidden by side chain shields. Other small details have also been attended to, such as the improvement of petrol fillers and strainers.

The Duo, a sociable-seated runabout, propelled by a twin air-cooled engine.

A friction-driven twin-cylinder four-wheeler, built by the Rex Co.

## THE LEO.

The Leo, which is sold by Derry and Toms, High Street, Kensington, W., has the whole of the power unit in the forecarriage, and the front instead of the rear axle is driven. The engine is an 8 h.p. J.A.P. 85 x 85 mm. The gear box contains two speeds, a reverse, the clutch and bevel drive to the front wheels. The engine is partly cooled by a chain-driven fan. The steering is by crown wheel and bevel, the latter being attached to a short

Power plant of the Leo cyclecar (front view), showing gear box on front axle, fan-cooled engine, etc.

shaft carrying a worm which meshes with a segment on the movable part of the forecarriage. The petrol tank is carried inside the dash. The engine can be started by means of a starting device from the driver's seat. The steering column is pivoted, and can be adjusted to any angle or height to suit the driver. The large Bowden lever on the offside of the dash controls the change-speed. The frame is hung on semi-elliptic springs in front and transverse spring behind.

## PHANOMOBILE.

Although the No. 1 Phänomobile is the only model bearing this name that, strictly speaking, comes within the definition of a cyclecar, the No. 2 T design is, from the motor cyclist's point of view, to all intents and purposes a cyclecar, and, moreover, it exemplifies a very neat adaptation of the torpedo body of Phänomobile design. The car is fitted with a 10-12 h.p. engine, having its two cylinders of 82 mm. bore and 110 mm. stroke placed side by side, as first introduced in 1912. A Claudel-Hobson carburetter and magneto ignition are fitted. The air cooling of the engine is assisted by a fan, which also serves to keep the mechanism free from dust. For 1913 we understand that the Phänomobile firm is retaining the well-tried and very effective epicyclic gear, and the chain drive. Mechanically, the design for 1913 only differs from that of the previous year in very minor details, but it is worth noting that detachable rims can now be fitted to order.

Side view of the Leo, the front steering axle of which machine is driven.

## THE PONETTE.

The Ponette is another vehicle of the cyclecar type, but bordering closely on the small car. It has a four-cylinder engine of 65 x 110 mm., thermo-syphon circulation, and multi-tubular radiator. Lubrication is by plunger pump, delivering oil from the tank on the dashboard to a trough in which the big ends dip. The internal clutch is of the ordinary leather-faced cone type, and the gear box contains two speeds and reverse, the final drive being by bevel. The pressed steel frame is unswept at the front and upswept slightly at the rear, the springing being by means of semi-elliptical springs front and threequarter elliptical rear. The steering is by worm and segment, and the control of the engine by accelerator pedal. It will be exhibited by N. A. Stevens, Godwin and Co., 19, Brick Street, W.

## THE KERRY.

The East London Rubber Co., 29, Great Eastern Street, E.C., inform us that the chief improvement in the Kerry motor bicycle for 1913 will be the fitting of the Armstrong three-speed gear, though the Kerry two-speed is unaltered and will remain on the market.

A new model lightweight Hobart. The engine has overhead valves.

## SILENCERS.

The other day we had an opportunity of driving a Rudge-Multi and sidecar, fitted with a newly designed silencer, which Rudge-Whitworth, Ltd. will probably adopt next year. In the opinion of the works manager, Mr. V. A. Holroyd, who showed us the device, an exhaust box of large dimensions is not essential to quietness, and certainly he has proved to us, by the test we made, that it is possible to make a very quiet exhaust box without apparent back pressure, and not exceeding ordinary dimensions. The interior construction of the new silencer is at present not for publication. The only exit for the exhaust gas is through an inch pipe.

We drove the combination, which carried a total weight of nearly twenty-nine stones at an average speed of twenty miles an hour, and did not spare it on hills. Owing to the quietness of the exhaust, we at least expected the engine to knock when the Multi gear was raised after climbing short sharp hills, but this was not the case, and from the very short trial we had, we are convinced that Rudge-Whitworth, Ltd., have found out how to make a silent exhaust box without rendering its size abnormal.

## 1913 DOUGLAS MODELS.

1913 Douglas models. Model O full touring machine.

Model S ladies'.

A visit to the Douglas works at Kingswood, Bristol, last week disclosed the fact that five models will be marketed in 1913. The first is called model N and is a single-gear model with counter-shaft and pedalling gear, but no two speeds. Model O is the light touring model with two speeds, free engine clutch, raised handlebars, footboards and larger petrol tank which now holds a quart more than last year. Divisions are also placed in the tank below the point where the new attachments are fitted. These latter are special brackets brazed to the top tube. The handle for operating the change speed rod is now securely attached to a special bracket also brazed to the top tube. This is very much neater than

and effective, and in addition to the side extension there is a very wide metal wing which is pierced at a point opposite the engine, so that any tendency for a vacuum to be created behind this mud-guard is prevented by the air passing

The 1913 tank, fitted with new spring fed oil pump and regulator.

through the slits. At the bottom where the metal guard would be likely to touch road obstructions a leather extension is riveted on to the wing. The side wings of the back guard are only provided on the belt side, as it has not been found necessary to fit them on the opposite side. These extensions keep all mud and water from being thrown on the belt, and should be an additional attraction to the already much sought after compound transmission of the

Douglas machines. The excellent results obtained with this twin horizontal engine have not necessitated any important alterations for next year. However, our illustration will show that the induction pipe has been altered to accommodate the new inlet ports which now form a clear passage direct to the inlet valve.

**Horse-power Extraordinary.**

The exhaust exit is also modified in design to enable a clearer path for the gases. The cylinder dimensions are 60.5x60 mm., and recent tests at the works, under the supervision of Professor Morgan, of the Merchant Venturers' College, Bristol, have shown that with a far brake one of these engines has given 9½ h.p. at a speed of 4,800 r.p.m. A maximum speed of 5,600 r.p.m. has been obtained, but at this speed power fell off. The exhaust pipe is one-eighth of an inch larger, and the Bosch enclosed magneto has been adopted. Previous to the introduction of the 1913 models, Douglas Bros. enclosed the magneto themselves. With a view to improving lubrication, a larger oil pump has been fitted. There is also a needle valve regulating the feed of the oil to the engine, the oil being forced through the regulator by a coiled spring in the pump barrel. If a full pump be

Douglas front mudguard. Note the slits to prevent a vacuum behind the engine.

this year's fittings, which were only clipped to the top tube. Owing to the wider tanks it has been found necessary to build a tube into the tank through which the operating rod passes. Model P is the light touring model with two-speed gear, double footrests, dropped handlebars but no clutch.

**Excellent Mudguarding.**

Model R. is the full roadster model, and in addition to the specification of the other machines this is provided with a kick starting device and special mudguarding, a detail illustration of which we publish. The front guard is very wide

Valve side of the Douglas light touring machine.

**1913 Models.—**

required suddenly to climb an unexpected hill, all that is necessary is to open the needle valve and operate the pump in the ordinary manner. The diameter of the friction clutch has been increased to 7in., and the clutch covering is now Raybestos.

**1913 Fittings.**

A detail improvement to the rear wheel is the shape of the belt rim. Previously, owing to its shape, this allowed mud to run up to the highest point and drop over into the groove for the belt. By altering this slightly in shape and placing a ridge close to the edge of the groove, any mud which climbs to the outer edge is flung off this ridge instead of dropping down into the groove. Both brake and clutch pedals are longer and situated more conveniently than before. The handle-bars are made slightly wider, and the ends are brought into a more natural position. The controls for magneto, carburetter, and brakes are now pinned to the bars by neat bolts which pass through small tubes brazed through the centre of the handle-bars. The lamp bracket of the Douglas machines is particularly strong. It is pressed from sheet steel, and is brazed and pinned to the underside of the steering socket. Passing up between the fork blades, it brings the lamp into the correct position for illuminating the number plate as well as the road. It is a particularly neat bracket, light and strong, and brazing it to the base of the steering socket is a very much better plan than clipping it round the handle-bar stem. The springs of the fork are now made with larger coils and thicker wire. This improves the springing of the fork, and does not destroy its resiliency. Hutchinson studded-tyres have been adopted as standard; the toolbags are slightly larger, and the modèle de luxe touring type will have a pan seat saddle.

**Ladies' Model Retained.**

The lady's model is practically the same as the model R. touring machine. The frame remains unaltered, but it will, of course, be fitted with the improved engine, wide front mudguard, and rear mudguard with side extensions.

**L.M.C.**

The new 4½ h.p. L.M.C. sidecar model, 80 × 92 mm. bore and stroke, is full of interesting points. A two-speed gear is provided, in which the drive on the high gear is by belt direct from the crankshaft to the back wheel, whilst on the low gear the drive is conveyed by chains through a clutch on the counter-shaft, which is, of course, always running, as it is permanently coupled to the engine. The gears available are from 4 to 5 to 1 on top, and from 9

to 10 to 1 on low. The belt and chain drive for the two gears are arranged on either side. The chain transmission is on the right-hand side, where is also mounted the pedal of the foot starter. The spindle to which this is attached is carried through to the further side of the machine, where it supports a geared segment meshing with a free wheel on the chain-driven counter-shaft. The engine is therefore started through the low gear chain, whilst the gear is in its free position.

The clutch for the high gear is carried on the engine-shaft, and consists of a

1913 2½ h.p. Douglas engine. The shape of the new induction pipes will be observed.

gun-metal expanding ring working inside a steel case, and operated by a wedge piece. This, in turn, is forced in and out against the action of a spring by a horizontal pivoted lever, which is hinged to a bracket on the front of the crank case, as shown. An exactly similar form of clutch is fitted to the low gear counter-shaft, and both of these clutches are operated by a toe-and-heel pedal placed just inside the right footboard. This pedal is connected up to a cam device, which operates the thrust rod, which in turn controls the action of the two clutches.

The pedal has, of course, three positions, viz., high gear, free engine, and low gear. The footboards themselves, which are rubber-covered, are very neatly sprung, the spring for this purpose being furnished with a means for

L.M.C. spring fork link.

adjustment, so that the tension can be altered to suit the weight of the rider. A neat half compression device, in which a second subsidiary cam is thrown into action underneath the exhaust tappet, is carried inside the timing case, and is worked by a small lever, giving two positive positions, and supported at the side of the tank.

A very good point which has been included in this machine is the use of deeply flanked mudguards to both the front and rear wheels. In the latter case, the larger half of the mudguard is supported by the carrier, which, upon the removal of a single pin, hinges downwards and gives very complete access to the tyre. The spring forks have also undergone some little modification. The fork is shown in the illustration below, from which it will be seen that the spring is now wound open instead of closed, as previously, so that upon the rebound the motion can be softly taken up. The oscillating links supporting the hub are carried in hardened steel and phosphor-bronze bearings, which, in the event of wear developing, are readily renewable.

It will be noticed that the link is slotted to allow free removal of the front hub, whilst the washer underneath the securing nuts is cupped to register with a flat cone on the link itself, and so prevents the possibility of the hub slipping out of position, even should the nuts be slightly loose.

Belt side of 3½ h.p. 1913 L.M.C. Notice the efficient mudguards which have side extensions for their entire length.

#### TIME TO LIGHT LAMPS.

Nov. 14th	...	5.11 p.m.
" 16th	...	5.8 p.m.
" 18th	...	5.6 p.m.
" 20th	...	5.3 p.m.

#### "The Motor Cycle" Show Numbers.

This issue is the first of our three special numbers in connection with the Olympia Motor Cycle Show, and is mainly devoted to passenger motor cycles of all types. Next week "The Motor Cycle Buyers' Guide of 1913 Models" will appear. *The Motor Cycle* for the 28th inst. will contain a complete description, with numerous illustrations, of the Olympia Motor Cycle Show exhibits.

#### Road Dangers.

A motor cyclist member of the A.A. recently suffered injuries—and his machine was badly damaged—through being thrown off his machine while rounding a corner where the road was strewn with refuse dropped from farmers' carts. As it is an offence under the Highway Act 1835, for any matter to be laid on the highway to the injury or personal danger of road users, the facts were reported to the responsible authorities, who are communicating with the farmer in question.

#### Auto Cycle Union Notes.

**RAILWAY RATES FOR CYCLECARS.**—The Auto Cycle Union is now busily engaged in trying to persuade the railway companies to reduce the rates for carrying cyclecars, which are now charged the same freights as motor cars, by train.

**CLUB ROOMS AT OLYMPIA.**—The Princes rooms at Olympia, which are placed at the disposal of the A.C.U. and affiliated club members, are also available for members of the Scottish Auto Cycle Union and the Motor Cycle Union of Ireland, as there are reciprocity agreements between these bodies and the A.C.U.

#### Proposed Ten Days' Trial.

Kendal seems a likely spot as a centre for the proposed ten days reliability trial of the Auto Cycle Union next year. We have already mentioned that there is a proposal afoot to merge the Scottish and English six days' trials into one long event. Mr. C. B. Robinson, the hon. secretary of the Westmorland M.C.C., told us last week that he could almost guarantee £100 worth of prizes if the Auto Cycle Union select Kendal as the centre, influential local gentlemen being interested in the proposals. Hotels and garages are also willing to give assistance, whilst the local press too favour the project.

Parent cyclecar. Front view. See description on page 1319.

#### The Gometz Hill Climb.

The hill climb organised by the Auto Cycle Club de France at Gometz-sur-le-Chatel will be held on December 1st.

#### SPECIAL FEATURES:

THE EVOLUTION OF CYCLECARS.  
B.M.C.R.C. EIGHTH MONTHLY MEETING.  
SOME CONTINENTAL RUNABOUTS.

Motor cyclists anxious to take part, should signify their intention of so doing to the secretary of the A.C.U., who can then make the necessary arrangements as to the prices of tickets, customs' facilities, etc. Members are particularly requested to be prompt.

#### A Mystery.

Is it true that a certain rider, who is credited with successfully climbing Blea Tarn in the autumn one day trial, never put in an appearance at the hill at all? There is such a report current in Kendal, confirmed by the local observers.

#### Stolen Machines.

On the 25th ult., at 10.30 a.m., a 3½ h.p. Triumph, registration H 4277, was stolen from the office of Mr. A. Hermon Turner, King Street, Reading.

Another machine was stolen from Mr. T. C. Harrison, Longridge Vicarage, Preston. It has a 3½ h.p. De Dion type engine, and the registration is B 604. The name "Dean" is on the tank, and the machine has a 1911 Bosch magneto and B. and B. carburetter.

Side view of the Parent, a new light cyclecar of French origin (see page 1319).

**A Racing Absentee.**

A notable absentee from the B.M.C.R.C. race meeting at Brooklands last Saturday was G. E. Stanley, the Singer exponent, who has been ill in bed for a fortnight.

**Horse Power.**

It is interesting to note that the horsepower of a 2½ Douglas running at 4,800 r.p.m. worked on Prof. Dendy Marshall's formula is 10.54 h.p. The actual brake-horse-power claimed by the makers, calculated by fan brake at the same speed, is 9½ h.p.

**The Godfrey-Garrett Duel.**

Doubt still exists in the minds of spectators at Brooklands last Saturday as to the actual winner of the 500 c.c. hour race. After all, Garrett and Godfrey should be able to settle all doubts on this score, and from what we know of them both we think that they are sufficiently good sportsmen to prevent doubt existing for long.

**Slow Moving Vehicles in London Streets.**

It will be remembered that the A.A. and M.U. has during the past two years endeavoured to secure the adoption of a byelaw by the London County Council rendering it compulsory for slow moving vehicles to keep close to the near side of the street. *The Motor Cycle* understands that the Home Secretary has approved a list of streets to which the byelaw should apply. It may therefore be anticipated that the byelaw will be adopted in the near future.

**An Engine without a Flywheel.**

Not long ago we heard of an unusual occurrence which is likely to be of general interest. A purely experimental engine of the outside flywheel type was on the road undergoing tests; the flywheel had been altered from the original casting for various experimental reasons, and though the makers knew that the thickness was hardly sufficient for safety, they decided on a trial run. The result was a first flywheel some miles from home, yet the engine (a single-cylinder) was re-started by hand and the machine successfully driven home. It should be stated that a fairly heavy clutch was fitted on the counter-shaft.

**No Lights on Sidecars.**

So far as we have been able to ascertain, there is a byelaw in Glamorgan-ire, sanctioned by the Secretary of State, which makes it compulsory to carry two lights on a motor cycle with a sidecar. It comes about as follows: The Lights on Vehicles Act, 1907, requires all vehicles to which the Act applies to have a light on the off or right side, and the byelaw mentioned requires any vehicles to which the byelaw applies to have a light also on the left side. The 1907 Act does not apply to motor cycles or motor tricycles, but the byelaw applies to a motor tricycle and not to a motor cycle. The byelaw bears a footnote pointing out that it was duly submitted to the Secretary of State on January 28th, 1903, and not disallowed within the time fixed by law. We received a communication a few weeks ago from the Under Secretary of State informing us that he could not supply the names of counties in which

these byelaws existed. A motor tricycle is a motor cycle, and the Act of 1907 does not apply to motor cycles, yet a county byelaw like this can go farther than an Act of Parliament, and a motor cyclist ignorant of the byelaw who is seen riding a sidecar machine, in the

FUTURE EVENTS		
Nov. 8-16.	MOTOR CAR SHOW	AT OLYMPIA.
" 25-30.	MOTOR CYCLE SHOW	AT OLYMPIA.
Dec. ..	Auto Cycle Union Open Silencer Trial.	
" 27-28.	Motor Cycling Club Annual Winter Run.	

county is fined 40s. and costs. The latest information received on the subject just as we are going to press is that the byelaw has been amended so as to require sidecars to carry a rear red light as well.

**Autumn One Day Trial.**

The official awards in connection with the A.C.U. one-day trial in the Lake District have now been issued. Of the total number of starters (54), seventeen in the single and passenger classes have been awarded first-class certificates. They are as follow: C. T. Newsome and D. H. Noble (3½ Rovers), J. R. Alexander (7 Indian), Eric Walker (4½ Monarch), S. T. Tessier (5 Bat), L. Newey and R. C. North (3½ Ariels), G. D. Hardee (3½ Triumph), W. Pratt and P. Shaw (3½ P. and M.'s), S. A. Rowlandson (3½ Rudge), S. Crawley (3½ Triumph), R. G. Mundy and J. T. Wood (3 G.W.K.'s), H. F. S. Morgan (8 Morgan), J. Chater-Lea, jun. (8 Chater-Lea), and F. Smith (5-6 Clyno sc.). Of this list one only is a private owner, viz., G. D. Hardee.

**A Sidecar Feat.**

We hear that last week a 4½ h.p. (650 c.c.) Excelsior succeeded in climbing Sudeley Hill with a load of three full-grown passengers and a low gear of 9 to 1.

**A Long Week-end Run.**

We covered nearly 500 miles in two and a half days on a Humberette last week-end, a performance which goes to prove that cyclecars are thoroughly dependable. The weather, too, was of the worst possible description, yet no difficulty was experienced in averaging the legal limit—and a little over!

**The Limit!**

One hundred and four miles were actually covered by a Premier rider last week, no lubricating oil being given to the engine after the start. Though to some extent instructive, we almost fear to mention the test lest novices may be foolish enough to attempt to emulate the feat. Testing a machine to ruin opens many other fields. To others on the look out for something sensational, we suggest a run on a motor cycle from Coventry to London without tyres, just to test the wheel rims and springing, or, say, a non-stop run at 20 m.p.h. with a gear ratio of 10 to 1.

**Cyclecars at the Motor Show.**

Although strictly speaking no cyclecars whatever are exhibited at Olympia, there are several miniature vehicles to cover which the definition of cyclecar might possibly be stretched. These include one single-cylinder Zebra, 88 × 106 mm.; one single-cylinder Globe, 105 × 120 mm. (described on page 1318); one 8 h.p. Ariel (illustrated November 7th), twin-cylinder, 85 × 85 mm.; one 8-10 h.p. four-cylinder Marlborough, 59 × 100 mm.; and the Baby Peugeot (described October 31st), four cylinders, 55 × 90 mm. These are fairly familiar to our readers. All have engines which come well within the cyclecar qualification of 1,100 c.c.

MIDLAND CLUB'S RELIABILITY TRIAL.

After lunch at Cheltenham the competitors were sent away in pairs from Steel's Garage by Mr. Howard Smith. Our photograph shows S. A. Rowlandson (3½ h.p. Rudge) and R. H. Edwards (3½ h.p. Triumph) about to start.

## Accessories at the Motor Show.

MESSRS. ROSS, COURTNEY AND Co. show a neat little petrol gauge adaptable specially for motor cycle tanks. A sketch of this is given which shows its simple mechanism. A varnished cork float is adapted to slide up a helical twisted rod, which carries at its upper end a small finger under the glazed lid of the cap. Vertical motion of the float is accordingly transformed into a rotary motion in the indicator hand which registers on the dial so that the contents of the tank can be seen at a glance.

Ross Courtney's petrol tank gauge for motor cycles or cars.

On SIMM'S stand the centre of attraction is the Seebright combined lighting dynamo and H.T. magneto. This machine is quite self-contained, and is not very much larger than an ordinary magneto. It is of special interest to motor cyclists because it foreshadows, undoubtedly, the means which will be adopted for electric lighting of motor cycles in the future, and we believe that a motor cycle model is already being prepared.

The Stuart-Turner water-cooled two-stroke twin-cylinder machine. The transmission is by propeller-shaft with worm drive. It was described in our issue of Oct. 31st.

S. SMITH AND SON'S latest introduction is a carburetter for motor cycles, this is a reduced facsimile of the Smith carburetter, which has already earned an enviable reputation for car use in a very short time. This instrument is entirely automatic. The usual type of float chamber supplies four jets, which are contained within a choke tube divided by two diametrical walls which therefore form virtually four small choke tubes. One of these is sharply tapered in order to supply a high velocity of air past the jet for easy starting. At the top of the choke tubes are four ports, one for each, and these ports are uncovered one after the other by a cap which is worked quite

Smith's four-jet carburetter.

automatically by the suction of the engine itself. An extra air setting is shown as arranged in the sketch in the form of a collar immediately over the base of the jets. No extra air lever is, however, required, as the air adjustment needs attention only from time to time. The throttle is worked by Bowden wire. This carburetter is used on the Humberette.

FENESTRE, CADISCH AND Co.—This firm show an exceedingly neat little Zenith carburetter designed for motor cycle use, which is light in weight, and simple in form. It embraces all the

The Zenith carburetter for motor cycles.

essential parts of the full size Zenith, which has already obtained such an enviable reputation for power, slow running, and flexibility. The motor cycle Zenith is of the single lever type.

The Millford-Cruiser sidecar. This model has a frame encircling the wheel by means of which both ends of the hub spindle are supported.

### A NEAT TERMINAL.

An ingenious and effective form of terminal has lately been brought out by Messrs. Delafields, 8, Bedford Street, Plymouth, which is known as the Robshaw. As clearly shown by the

illustration, it consists of two portions, wire is wound round the projecting eyelet, and the two are pressed together, and finally the sleeve is slipped over the whole.

Chassis of the new T.M.C. four-cylinder water-cooled cyclecar to be exhibited at Olympia.

## THE T.M.C. CYCLECAR.

A new cyclecar, built on accepted lines, is the 7 h.p. T.M.C., made by the Wilkinson T.M.C. Co., Acton, W. The engine is water-cooled, has four separate cylinders,  $61 \times 70$  mm. = 816 c.c. A cross shaft, driven by skew gearing, drives the magneto on one side and the water pump on the other. A honeycomb radiator is fitted. The carburetter is the Stewart-Precision automatic. The oiling is by gravity through a sight-feed lubricator. Inside the crank case is a pump, driven off the camshaft, which returns the surplus oil.

Both petrol and oil tanks are carried under the dome-shaped dash. Engine and gear box are carried on a sub-frame, the gear box is close up to the clutch, and no universal joint is employed. The clutch is of the leather-to-metal type, and three speeds and reverse are provided. Universal joints of the slotted ball type are fitted to each end of the propeller-shaft, and the final drive is by bevel gear. There is an external foot brake on the gear-shaft, while internal brakes are fitted to the rear wheels. The frame is of channel steel narrowed in front to allow of ample lock, and suspended on semi-

elliptical springs at the front and quarter-elliptical springs at the rear. The design of the vehicle shows promise of a successful future. It will be exhibited at the Olympia Motor Cycle Show.

## JOB DAY CYCLECAR.

The cyclecar made by Messrs. Job Day and Sons, of Leeds and London, and designed by Mr. H. A. Smith, has a twin-cylinder V type air-cooled engine,  $55 \times 88$  mm. = 998 c.c. The transmission is through a cone clutch faced with vulcanite fibre and a three-speed gear of sliding type to a pair of bevel wheels and counter-shaft, on which is a straight pinion differential. At each end of the counter-shaft are pulleys for belt drive or sprockets for chains. The makers favour 1 in. V belts.

The tubular frame weighs 60 lbs. The wheelbase is 6 ft. 6 in., and track 3 ft. 9 in. The weight of the chassis is  $4\frac{1}{2}$  cwt., and the complete weight  $5\frac{1}{2}$  cwt.

The gear control is through a semi-gate change-speed quadrant. Two brakes are fitted, both acting on the rear wheels. The wheels are 26 in. diameter with 65 mm. tyres, all wheels are detachable and interchangeable, and a spare wheel can be carried. The whole of the bearings, with

the exception of the engine bearings, are of the swivelling two-row type ball bearings. The supply tank holds  $2\frac{1}{2}$  gals. of petrol and 2 qrts. of lubricating oil. Lubrication is pressure fed, and the lubricators are replenished by foot pressure.

Twin-cylinder air-cooled engine fitted to the Job Day cyclecar.

An easy starting device enabling the engine to be started easily can be put in operation from the driver's seat.

The complete vehicle, built by Job Day and Sons.

6-3 h.p. twin Alldays-Matchless which has chain drive and three-speed gear. The efficient chain guards will be noticed.

Valve side of the 1913 pattern chain-driven Star.

## THE STAR.

The Star Cycle Co., Wolverhampton, are no new firm to motor cycle manufacture.

magneto is chain-driven and situated at the rear of the cylinder. The transmission is by chain running in a chain case, and neat footboards are fitted. The foot

## THE SWIFT.

The 3½ h.p. Swift standard touring machine, which possesses particularly pleasing lines, has a 3½ h.p. 86×85 mm. engine. The valves are of large diameter and adjustable tappets are fitted. The cylinder, which is provided with large radiating fins, is rendered easily detachable, as the holding down bolts are placed in the most accessible position possible. The tank has been enlarged to carry 1½ gals. of petrol and 3 pts. of oil. Both rear and front stands are fitted. The saddle is Brooks B. 104, with padded top, and is very comfortable and gives a low riding position. The mudguards have been a good deal improved, the front guard being provided with large mud flaps, and the rear guard with an extension piece on the belt side, which is a most desirable feature. The handlebars have been brought well forward and strengthened, and the ends have been dropped, rendering the riding position most comfortable. Two pairs of footrests are provided, those in the front being adjustable. The frame is very strongly constructed and has the top tube dropped at the rear.

The three-speed touring model, similar in detail to the above, is fitted with an

Three-speed touring Swift. The kick starter is a new feature of these machines.

Standard T.T. model Swift.

They have decided to market for 1913 the machine we illustrate. This, as will be noticed, has a somewhat unconventional type of frame. The vertical single-cylinder engine has neatly enclosed valves. The

brake operates on a brake rim attached to the right side of the rear wheel. Saxon front forks are employed, and the front guard has side extensions brought well round the wheel.

Armstrong three-speed gear with free engine clutch. This is the new model Armstrong which can be started with the driving wheel on the ground, and for this purpose a kick-starter is provided.

The T.T. model is of similar pattern, but without the special mudguarding devices mentioned above, and can be fitted with Armstrong three-speed gear if desired.

The Swift Company have just completed a most successful season, as during 1912 numerous excellent performances have been accomplished by them. Among these we may mention the ascent of Arms Hill by F. J. Watson on a single-cylinder sidecar machine. All models referred to are fitted with a half-compression device. A special feature is a new petrol filter so placed that it is easily taken apart for cleaning. When the union is detached every drop of petrol can be emptied from the tank.

The new Swift cyclecar was fully dealt with in our last issue. This excellently designed four-wheeler has a twin-cylinder water-cooled engine, three-speed gear, and shaft drive.

Chassis view of the four-cylinder Ponette, a vehicle on the border line of car and cyclecar.

# B.M.C.R.C. EIGHTH Monthly Meeting

THE last meeting of the B.M.C.R.C., held on Saturday, was a fitting conclusion to the club's successful year. Even at an early hour, when the time trials were being run off, and there was nothing of a spectacular nature going on, there was a large crowd brought down to Brooklands by train, car, and motor cycle. The morning was fine and mild for the time of year, but a strong south-westerly wind prevented record times being made. The new four-valve single-cylinder and eight-valve twin-cylinder Indians were the centre of an interesting group of spectators. They have two inlet and two exhaust valves in each cylinder, operated by forked rockers. A large exhaust pipe is fitted, and ports are drilled communicating direct with the air. The machines are ingenious and clever from a racing point of view, but will not be marketed in any form. The long-stroke Rudge is a recent arrival at Brooklands, and is now fitted with a special inlet dome, to which the standard exhaust valve is fitted, thus rendering the valves interchangeable. Among the cyclecars we noticed a new G.N. with the engine set across the frame and shaft drive to a counter-shaft, the final drive being by belt, very large pulleys being used. Below are given the results of the fourth 1912 time trials. Certificates are awarded for the best performances in each class, and the club's gold medal to the riders making the best aggregate performance in each class during 1912 who have taken part in all but two of the series.

## The Time Trials.

### CLASS A (not exceeding 275 c.c.)

Rider, Machine, and Cyls.	Bore and Stroke.	c.c.	Kilometre.	Mile.
	mm.		secs. m.p.h.	secs. m.p.h.

CYCLECARS.					
A. W. Lambert, Morgan-Jap (2) .....	90 x 85	1021.5	37.9=58.94	67.6=58.86	
J. T. Wood, G.W.K. (2) 86	x 92	1068	40.4=55.37	64.1=55.73	
F. E. Readwin, Sabella (2) 85	x 95	1096	47=57.59	70.4=47.75	

Those who rode more than once had paid extra entry fees, but we understand this will not be allowed in future.

The winner of the cyclecar hour race, H. F. S. Morgan (two-cylinder Morgan-Jap), surrounded by an admiring group. He created a new record.

Racing proper began at 11.45 a.m. with the Olympic Cyclecar Race. Prizes: The Club's gold, silver, and bronze medals to the first, second, and third respectively, and the Club's certificate on request to all finishing.

Run together with this race, but started just after it, was the Olympic Sidecar hour race, limited to sidecar machines not exceeding 1,000 c.c. and for similar prizes. The fact that both races were run together made them exceedingly difficult to follow. As regards the cyclecars, Morgan established a lead from the first, but for the first five laps Wood hung on to him gamely until water on the h.t. terminal caused him so long a delay that he did not restart until Morgan had completed his ninth lap. Various troubles played havoc with many. Tessier's flywheels came adrift. Godfrey broke a piston and Ware's cylinder head blew off. In his fifth lap Jones (Bedelia) retired owing to inlet valve trouble. Martin sheared a key in the transmission of the Morgan he was driving. Nash, on a new type G.N., broke a petrol pipe, but re-started later. Gibson (Bradbury sc.) suffered from misfiring. McDonagh's long-stroke Rudge had a stretched exhaust valve, and Carter's Arden broke a connecting rod. In the cyclecar class Wood made a gallant effort to gain lost time, but his undershield came adrift, and caused him to slow up somewhat. Sanger (Bat sc.) had a burst sidecar tyre. Result:

The three-lap race for machines not exceeding 500 c.c. was the next item on the programme, and in it Godfrey on the new four-valve Indian (a machine built solely for racing) signally distinguished himself. Godfrey led from the start, and on the first lap was followed by Brewster, Hill, Bateman, Weatherilt, Spencer, Elce, Greaves, and Woodhouse. The second lap order was, Godfrey, leading by 300 yards, Brewster, Weatherilt, Hill, Elce, Spencer, Bateman, Woodhouse, and Greaves. The result was as follows:

Rider and machine.	Bore and stroke.	c.c.	m.	s.	m.p.h.
1. O. C. Godfrey (1 Indian)	82.5 x 93	497	7	22 1/2	65.6
2. P. Brewster (1 Norton) ...	79 x 100	490	7	26 1/2	64.27
3. P. Weatherilt (1 Zenith) ...	90 x 77.5	494	7	40 1/2	63.9
L. Hill (1 Rudge) ...	85 x 88	499	7	43	
W. H. Elce (1 Rudge) ...	85 x 83	499	7	49 1/2	
F. Bateman (1 Rudge) ...	85 x 88	499	8	1 1/2	
W. S. Spencer (1 Rudge)	85 x 88	499	8	3	

The next event was the Junior Hour Race for machines with engines not exceeding 350 c.c. For the first three laps Harry Martin led the procession, followed by Bailey, Mason, Bashall, Newsome, and the remainder, but in the third lap Martin's petrol pipe broke and placed him *hors de combat*.

O. C. Godfrey (4 h.p. Indian) winner of the 500 c.c. three-lap race at Erocklands last Saturday.

H. Reed (two-cylinder Dot-Jap) a popular winner of the 1,000 c.c. three-lap race at the eighth B.M.C.R.C. meeting.

#### CYCLECARS.

	mm.	c.c.	mls.	yds.
1. H. F. S. Morgan (2-cyl. Morgan-Jap) ...	90 x 76	966	55	329*
2. F. E. Readwin (2 Sabella) ...	85 x 95	1,096	47	1,540
3. J. T. Wood (2 G.W.K.) ...	86 x 92	1,068	46	1,202
F. W. Carryer (2 Duo) ...	85 x 85	964	33	1,260
A. G. F. Nash (2 G.N.) ...	80 x 98	985	33	676
L. F. de Peyrecave (2 Duo) ...	85 x 85	964	33	400

\*Record

Morgan, who gained the hour record (previous best J. T. Wood, G.W.K., 25th September, 1912, 47 mls. 1,390 yds.), also got the 50 miles, time 54m. 39 1/2 s. (previous best J. T. Wood, 25th September, 1912, 1h. 2m. 32s.)

#### SIDECARS.

	mm.	c.c.	mls.	yds.
1. F. W. Barnes (2-cyl. Zenith)	90 x 77.5	988	51	897
2. S. F. Garrett (1 Green-Precision) ...	85 x 88	499	49	420
3. C. B. Franklin (2 Indian)	82.5 x 93	994	47	210
J. Woodhouse (1 Regal-Precision) ...	89 x 99	617	45	1,475
H. Gibson (1 Bradbury) ...	89 x 89	554	40	1,085
A. W. Sanger (2 Bat-Jap) ...	85 x 85	965	38	83
A. J. McDonagh (1 Rudge) ...	85 x 132		6 laps	
G. F. Hunter (2 Zenith) ...	90 x 77.5		4 laps	
G. Griffith (2 Zenith) ...	90 x 77.5		4 laps	
S. T. Tessier (2 Bat-Jap) ...	85.5 x 65	736	2 laps	

Then Bailey went to the front, but a broken tappet delayed him for some time. The lead was now left in the hands of Mason, who maintained it throughout the race, with Newsome a good second. In the seventh lap Thompson's high-tension wire came adrift, while Bashall was troubled by misfiring, and McNab by oil on the belt. Bailey, after re-starting, covered many laps at a splendid speed in a vain endeavour to recover lost ground, but he finally had to retire owing to a broken rocker. The result was as follows:

	mm.	c.c.	mls.	yds.
1. H. Mason (2-cyl. N.U.T.-Jap)	60 x 61	350	52	625
2. W. F. Newsome (2 Douglas) ...	60.5 x 60	350	51	1,368
3. L. Temple (2 Moto-Rève) ...	53 x 77	340	41	688
T. Thompson (2 Douglas) ...	60.5 x 60	350	40	1,680
W. H. Bashall (2 Douglas) ...	60.5 x 60	350	38	1,627
S. L. Bailey (2 Douglas) ...	60.5 x 60	350	38	83
H. P. Beasley (1 Singer) ...	69 x 80	299	33	108

Beasley suffered considerable delay through his oil pump not working properly.

The three-lap race, not exceeding 1,000 c.c., provided a good deal of excitement. Poor C. R. Collier slipped and fell just as his big twin began to fire; he was dragged along for a yard or two, and by sheer pluck and strength he recovered himself, and by a supreme effort reached the saddle, but, despite help from his pusher-off, he had to retire, as the belt broke when the engine fired again. Bashall took the lead at the start, and at the end of the

first lap was first over the line, followed by Franklin, Remington, Reed, Hunter and Rogers, who brought up the rear some way behind. At the second lap, Franklin assumed the lead, with Reed second and Bashall third. Reed's Dot was running magnificently, and brought him in an easy winner. Result:

		mm.	c.c.	m. s.
1. H. Reed (2-cyl. Dot-Jap) ...	90	× 77.5	988	6 31 <sup>2</sup> / <sub>5</sub> *
2. C. B. Franklin (2 Indian) ...	82.5	× 93	994	6 33 <sup>1</sup> / <sub>5</sub>
3. E. F. Remington (2 Matchless-Jap) ...	90	× 77.5	988	7 10
W. H. Bashall (2 Zenith-Jap) ...	90	× 77.5	988	
T. Rogers (2 Matchless-Jap) ...	90	× 77.5	988	
H. Hunter (2 Zenith-Jap) ...	90	× 77.5	988	

\*Reed's time equalled 74.97 m.p.h.

Franklin was riding the twin racing Indian with four valves in each cylinder. The fastest lap was made by Harry Reed, and the fastest lap from standing start by Bashall, 74.12 m.p.h.

The last race of the day was one of the most interesting and exciting events ever witnessed at Brooklands. This was the Senior Hour Race for machines with engines not exceeding 500 c.c. Emerson (Norton) led on the first round, followed by the Rudge riders, Bateman and Hill, and the remainder. Emerson looked a certain winner, but in the early stages of the race Weatherilt promised to cause him some trouble. After leading for many laps, Emerson had to stop through the top of his float chamber coming unscrewed, and the race resulted in a terrific duel after the twelfth lap between Godfrey and Garrett. Emerson's stop lost him two laps, and, despite his strenuous efforts, he got no nearer than two miles to the second man. Towards the end it was a ding-dong race between the two leaders, and, seeing that there would be some trouble in settling who was the leader at the expiration of the hour, Mr. A. V. Ebbelwhite, the senior timekeeper, sent Mr. A. G. Reynolds with a synchronised watch and a pair of strong field glasses to the top of the tower over the club buildings in the paddock. Godfrey and Garrett crossed the line simultaneously on the last lap, after which Garrett shot ahead, and was leading at the members' bridge. That was all we at the fork knew. Garrett was thought to be a certain winner, and the crowd was delighted. A dozen enthusiasts joined hands

S. F. Garrett (1½ h.p. Green-Precision), whose speed in Class C time trial with sidecar was 48 miles an hour.

and danced round Mr. F. E. Baker, the manufacturer of the Regal Green-Precision engine, and when Garrett arrived he was carried shoulder high. When the news came that as the hour expired Godfrey was leading by eight yards, Garrett objected to the decision and lodged a formal protest. The result was as follows:

	mm.	c.c.	mls.	vs.
1. O. C. Godfrey (1-cyl. Indian) ...	82.5 × 93	497	60	1,370
2. S. F. Garrett (1 Regal Green-Precision) ...	85 × 88	499	60	1,362
3. J. L. E. Emerson (1 Norton) ...	79 × 100	490	58	1,047
P. Weatherilt (1 Zenith) ...	90 × 77.5	494	55	1,590
J. Lamb (1 Triumph) ...	85 × 88	499	55	1,276
W. Stanhope Spencer (1 Rudge) ...	85 × 88	499	51	1,119
H. Reed (2 Dot-Jap) ...	76 × 54.5	495	49	1,236
H. Greaves (2 Enfield) ...	60 × 75	425	49	

## A.C.U. Autumn Trial. Judges' Report.

THIS trial, held in the Lake District, starting and finishing at Kendal, proved a good and severe test, both for machines and riders, although the course of 103 miles was shorter than usual.

The weather was ideal for the purpose, first severely cold, then mild and windy, the day ending in heavy rain. The cold proved that the protection of carburetters, either by shields or by exhaust heating, is still not fully provided for. There were several stops owing to frozen carburetters. The mild and windy part of the day proved that overheating of air-cooled engines has still to be contended with, as witness the failures on Underwood Hill and Dunmail Rise, and the fact that many engines that did not actually stop here were labouring heavily and getting dangerously overheated. And, lastly, the condition of machines and riders at the finish, and also the belt-slip noted on the few rises between Ambleside and Kendal traversed in the rain, proved that there is yet room for much improvement in the mudguarding both fore and aft. The magnetos in this trial gave no apparent trouble and caused no stops.

The route was a splendid one for the purpose of the trial, and, with the exception of Blea Tarn Pass, not too severe for the proper testing of the modern motor cycle. The road surfaces were on the whole good, and hardly any tyre trouble was reported. This was also largely due to the fact that the quality of tyres has greatly improved of late, and that motor cycles are not so under-tyred as they used to be.

The condition of machines at the finish was, from a mechanical point of view, good. In a few cases steering heads were loose. On one machine the wheels were badly out of track (pointing to frame weakness). Most engines were noticeably free from waste oil, while several left much to be desired in this respect. Front brakes still require the closer attention of manufacturers. Most of the motor cycles entered proved reasonably silent. The performance of the machines taken as a whole was very good, mechanical

breakdowns were very few, and with two or three exceptions the engines seemed most efficient. The power developed by the engines of the Morgan, the three G.W.K.'s, the Clyno, and Chater-Lea was especially noticeable. The ability of several riders was very poor, and gave the impression that the men had very little experience in districts abounding in sharp turns and steep hills. The old fault of neglecting to lower the gear early enough and trying to change up too soon was noted again and again, and caused several failures, as did apparently too little knowledge of carburation and ignition. On the other hand, the expert driving of the majority of the competitors is deserving of great praise. Exceptionally fine performances were those of Rex Mundy (G.W.K.) on Tow Top, and C. T. Newsome (Rover), D. H. Noblé (Rover), J. R. Alexander (Indian), V. Busby (Alldays), S. Crawley (Triumph), and F. Smith (Clyno), on Blea Tarn Pass.

One all too common a feature was the ignorance of the printed rules shown by the majority of the competitors. Riders would add greatly to their own chances of success, and also lighten the duties of officials, if they would only make themselves conversant with this simple printed matter before they come to the post.

Judges { E. PERCY GREENHILL.  
W. B. LITTLE.  
S. W. CARTY.

### THE AWARDS.

The results table appeared in *The Motor Cycle* of October 31st.

The undermentioned were officially credited with non-stop runs on the day of the event, but the judges have not confirmed the awards: J. E. Greenwood (2½ Sunbeam), assisted on Tow Top, Kirkstone, and Foolstep; G. T. Gray (¾ Rudge), climbed Red Bank under set speed, assisted with feet on Tow Top, and stopped on Foolstep.

**Colchester and District M.C.C.**

It is proposed to form a club with the above title. Riders are asked to communicate with Mr. H. B. Chapple, Butt Road, Colchester.

**North-west London M.C.C.**

At an extraordinary general meeting of this club, all the members of which are amateurs, several new rules defining the amateur status were adopted. No shamateurs need apply.

**Canterbury and District M.C.C.**

A petrol consumption trial took place on the 7th inst. over a course of  $24\frac{1}{10}$  miles. Result:

Competitor and machine.	Miles per gal.	Ton-miles per gal.
L. Rumens ( $3\frac{1}{2}$ Singer three-speed) ...	213	40.25
G. Denne ( $3\frac{1}{2}$ Triumph F.E.) ...	135	24.3
P. Kingsford ( $3\frac{1}{2}$ Triumph F.E.) ...	112	20.75
J. Poxon ( $3\frac{1}{2}$ Bradbury) ...	116	20.25

A speed-judging contest was held at the same time, and won by J. Poxon ( $3\frac{1}{2}$  Bradbury), with P. Taylor ( $3\frac{1}{2}$  Rover) second.

**Oxford University M.C.C.**

The results of this event, illustrations of which were published last week (page 1269) were as follow:

Class 1.—Sidecars: S. P. Openshaw (Christ Church College), 8 Zenith, 40 $\frac{1}{2}$ s.

Class 2.—Scratched.

Class 3.—Touring Singles: J. W. Pedley (Pembroke),  $3\frac{1}{2}$  Triumph, 37 $\frac{1}{2}$ s.

Class 4.—Tourist Trophy Singles: A. C. Hardy (New College),  $3\frac{1}{2}$  Norton, 31 $\frac{1}{2}$ s.

Class 5.—Any twin cylinder: S. P. Openshaw (Christ Church), 8 Zenith, 29 $\frac{1}{2}$ s.

Class 6.—Open class: S. P. Openshaw (Christ Church), 8 Zenith, 28s.

**Rand M.C.C. (Johannesburg).**

Result of mile speed trial held at Johannesburg, 13th October, 1912:

**STANDARD CLASS (seven entries).**

1. J. H. Cutting (Precision) ...	1m. 11 $\frac{1}{2}$ s.
2. F. Dunn (Triumph) ...	1m. 14 $\frac{1}{2}$ s.
3. S. Home (Rudge) ...	1m. 16 $\frac{1}{2}$ s.

**T.T. CLASS (sixteen entries).**

1. P. Flook (Triumph) ...	55 $\frac{1}{2}$ s.
2. W. Hodge (Rudge) ...	59 $\frac{1}{2}$ s.
3. E. Reynolds (Rudge) ...	59 $\frac{1}{2}$ s.

**OPEN CLASS (fourteen entries).**

1. G. Taylor (twin Bat) ...	56 $\frac{1}{2}$ s.
2. F. Layland (twin Indian) ...	57 $\frac{1}{2}$ s.
3. W. Hodge (Rudge) ...	58 $\frac{1}{2}$ s.

**M.C.C. of South Australia.**

The first hill-climb for the season of the above club was held at Snake Gully, a steep rise of threequarters of a mile about sixteen miles from Adelaide. The result was worked out on the formula,  $\frac{C \times T^2}{W}$ , as recommended by *The Motor*

*Cycle*, and first used in Australia by Mr. W. Churchward.

Rider and machine.

Points.

1. N. K. Torode ( $3\frac{1}{2}$ Triumph) ...	360
*2. L. S. Eglinton ( $3\frac{1}{2}$ Rova Kent) ...	306
3. C. Lindsay ( $3\frac{1}{2}$ Norton) ...	323
4. E. G. Clark ( $3\frac{1}{2}$ Rudge) ...	315
5. F. R. Limb ( $3\frac{1}{2}$ Calthorpe) ...	288
6. A. J. Hinton ( $3\frac{1}{2}$ Norton) ...	255

\* Fastest time.

**Mersey M.C.**

The above club held a trial on November 3rd, the course being a secret one of forty miles, embracing some of the most difficult and hilly by-roads in North Wales, the start and finish being at Queen's Ferry. There were over twenty entries, fourteen facing the starter. Result: 1, N. Brown (7 Indian); 2, H. C. Marston (8 Dot and sidecar); 3, J. Fox (7 Matchless).

The annual dinner and prize distribution, followed by the general meeting, will be held at the St. George's Restaurant, Redcross Street, Liverpool, on the 22nd inst.

**Cambridge University M.C.C.**

On the 4th inst. a hill-climb was held on Weston Hill, near Baldock. The hill is about 700 yards long, rising sharply from the main road, with a fairly steep gradient, and terminating in a right-hand bend at the top. The surface was good, except on the corner, where it was loose. Results:

**CLASS I.—Single-cylinders up to 560 c.c.**

On time.

1. E. N. Clifton ( $3\frac{1}{2}$ Triumph) ...	41 $\frac{1}{2}$ s.
2. S. R. Cooke ( $3\frac{1}{2}$ Rudge) ...	45 $\frac{1}{2}$ s.
3. B. de Montigny ( $3\frac{1}{2}$ Rudge) ...	45 $\frac{1}{2}$ s.

On formula.

Fig. of merit

1. E. N. Clifton ( $3\frac{1}{2}$ Triumph) ...	241
2. C. D. Betteridge ( $2\frac{1}{2}$ Singer) ...	248
3. S. R. Cooke ( $3\frac{1}{2}$ Rudge) ...	231

**CLASS II.—Twins up to 1,000 c.c.**

On time.

1. E. I. Gibbons (8 Martin) ...	33s.
2. {E. H. Lees (7 Indian) ... } {J. H. McClure (7 Indian) ... }	38 $\frac{1}{2}$ s.

# Midland Club's Annual Reliability Trial.

THE annual reliability trial of the Sutton Coldfield and Mid-Warwickshire A.C. was run off on the 9th inst., starting at the early hour of 7.30 a.m. from their headquarters at Sutton Coldfield, the whole course measuring 141 miles. Lunch was taken at the Plough Hotel, Cheltenham, one and a half hours being allowed, the first two competitors being due to arrive back at headquarters at 4.3 p.m., and the others in pairs at minute intervals. The route was well marked with confetti the whole way round, a car for this purpose being kindly lent and driven by Mr. George Patterson.

There were thirty-five starters out of forty entries. Legal limit had to be maintained, and at the secret check, six miles out, at Castle Bromwich, no fewer than fifteen out of the thirty-five starters were within 15s. of schedule time.

On Ilmington Hill (forty-three miles out) there were four failures, these being: G. L. Haydon (3½ Calthorpe), H. E. Perry (3½ Ixion), T. Pollock (3½ James), and G. N. Norris (3½ New Imperial). Pollock was unfortunate here in being unable to change his gear, as the observers on the more severe hills at Saintbury, Sudeley, and Willersey reported him as going well. F. H. Stephenson (Morgan Runabout) retired at Campden with a broken frame, whilst J. Gibson (8 Matchless) was also lost sight of.

On Saintbury Hill (fifty-two miles out) there were five failures, these being: Haydon, Perry, S. E. Elwell (Douglas), Norris, and G. H. Tangye (Forward), who pedalled. Excellent climbs (in thick grease) were made by S. A. Rowlandson (Rudge multi), R. H. Edwards (Triumph), Miss Hough (Scott), A. E. Winchcombe (Scott), W. D. South (5 Rudge and sc.), and H. Newey (2½ Levis and sc.)

On Sudeley Hill (sixty-four miles out) there were eight failures, these being: Haydon, Perry, G. Hill (Rudge), W. R. Jones (3½ Ixion), L. A. Bees (L.M.C.), Tangye, Norris, and K. Clark (6 Corah and sc.); the only lady competitor, Miss Hough, when making an excellent climb, was baulked very

Graham Dixon (3½ h.p. three-speed New Hudson and sidecar) on the steepest part of Willersey hill.

badly by a fallen competitor, but nevertheless succeeded in finishing the hill from a standing start. South ran out of petrol just before arriving in Cheltenham, Perry and Norris ran off the course before arriving in Cheltenham (seventy-seven miles out), whilst Smith and Stuart retired.

After the luncheon interval the only hill worthy of comment was Willersey Hill (sixteen miles out), which was in a fearfully sticky state, and on which there were eight failures, these being: Haydon, Hill, Jones, Bees, Norris, F. Sangster (Ariel), Clark, and G. Bryant (Motorette), whilst B. W. Lee was baulked, his second ascent being good. Specially good climbs were made by Edwards, Miss Hough, Elwell, South, and H. Newey, whilst there was no trace of Tangye. Of the remaining thirty-one competitors Haydon and Bees did not arrive at the finish, and Clark retired at Stratford-on-Avon after colliding with a bridge.

Out of the twenty-eight competitors arriving at headquarters (sixty-four miles out), there were eighteen making non-stop runs, but three of these, Miss Hough, A. D. G. Cleese (Veloce), and S. B. Mayell (Rudge multi), exceeded the time allowance of 2m. either way made at the control at Cheltenham. The other fifteen, therefore, Rowlandson, Edwards, Winchcombe, S. Crawley (Triumph), H. C. Newman (3½ Ivy), F. H. Southam (6 Zenith), W. B. Gibb (Douglas), J. Allday (3½ Allday), S. Smith (3½ Norton), F. C. North (Ariel and sc.), L. Newey (Ariel and sc.), A. D. Arter (James and sc.), H. Newey, H. G. Dixon (3½ New Hudson and sc.), and W. Guest (8 Matchless and sc.), may be considered to be all from which the committee will select the winners of the different prizes, amongst which are the Sutton Cup, two special prizes for amateurs, with special prizes in sidecar class and single-cylinder class.

The competitors were delighted with the way in which the whole route had been marked and the trial conducted. The exceptional way in which both Edwards and H. Newey completed this difficult course deserves to be specially mentioned.

W. R. Jones (3½ h.p. three-speed Ixion) and G. Hill (3½ h.p. T.T. Rudge) leaving Cheltenham.

## M.C.C. WINTER RUN: LONDON-EXETER AND BACK.

The start will be from Hounslow at 7 p.m. on Friday, December 27th. The route to be followed, starting from Hounslow, is *via* Basingstoke, Salisbury, Shaftesbury, Yeovil, Chard, Honiton, to Exeter. The return journey will be *via* Lyme Regis, Bridport, Dorchester, Blandford, to Salisbury, whence the outward route will be followed in the reverse direction to the finish.

Any competitor found more than 15m. ahead of minimum schedule time at any point of the route will be disqualified.

Silencers.—Every machine taking part in the run must be provided with an efficient silencer. Long exhaust pipes, except when these latter form the final outlet to an efficient silencer, are absolutely prohibited. The use of cut-outs in populous places will entail disqualification. No machine will be allowed to start which, in the opinion of the officials, is likely to cause annoyance to the public.

The schedule time for the first competitor at the chief places *en route* will be approximately as under:

Outward.—Hounslow, depart 7 p.m.; Basingstoke, 8.58 p.m.; Salisbury, arrive 11.0 p.m.; Yeovil, 2.31 a.m.; Exeter, 5.4 a.m.

Return.—Exeter, depart 6.34 a.m.; Dorchester, 9.10 a.m.; Salisbury, arrive 11.7 p.m.; Basingstoke, 1.55 p.m.; Hounslow, 3.47 p.m.

Awards.—Gold medals. In order to qualify for a gold medal entrants must sign the checking sheet at Exeter within 15m., either early or late, and the finishing sheet at Hounslow within 15m. early and 20m. late of their schedule time. Silver medals will be awarded to all finishing within 24hrs. who do not qualify for gold medals.

Intending competitors should apply to Mr. E. B. Dickson, The Croft, Pinner Road, Northwood, Middlesex.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

#### The Taxation of Motor Cycles.

Sir,—I have pleasure in informing you that, as a result of representations made to the Chancellor of the Exchequer by the Hon. Arthur Stanley, C.V.O., M.P. (chairman of the committee appointed by the Auto Cycle Union to represent the following bodies: The Auto Cycle Union, the Scottish Auto Cycle Union, the Motor Cycle Union of Ireland, the Automobile Association and Motor Union, and the Cycle and Motor Cycle Manufacturers' and Traders' Union), Mr. Lloyd George has definitely stated that, having gone carefully into the question, it is not his intention, as at present advised, to propose legislation to give effect to the suggestions made by the Horse-power Rating Committee regarding the increased taxation of motor cycles.

T. W. LOUGHBOROUGH, Secretary A.C.U.

#### The Life of Eriecyclic Hubs.

Sir,—The following experiences, all made with a sidecar and Triumph, may be of interest.

I fitted a N.S.U. two-speed gear last year and have driven 8,000 miles. Recently I had a new pulley flange put on, as the old one was worn; chiefly due to driving with a Whittle belt last year. The wear was not nearly bad enough to make a new flange absolutely necessary, but it conduced to belt slip, otherwise no repair of any kind was done to the gear. I had it once dismantled (after 6,000 miles) prior to going on tour—nothing was wrong.

Tyres: Sidecar (Clincher), 4,500 miles, still on. Front wheel Clincher, 4,000 miles. Driving wheel: (1.) Clincher 1,500 miles; then retreaded, and since has done 1,000 on front wheel. This tyre has not been punctured. (2.) Heavy Hutchinson, 2,000 miles; would have done more, but was badly cut, and the vulcanising did not hold. (3.) Pedley, 2½ in. by 2½ in. rim, 1,500 miles; still on and tread is hardly worn at all. This, to my mind, is the best heavy cover for 2½ in. rims I have seen. The centre ridge wears far better than rubber studs. The same company's belt I found excellent; it stretches a lot at first, but does not crack. Engine: I add this because it has been frequently stated that a 3½ h.p. will not stand prolonged sidecar work. Up to date (5,000 miles with 1912 Triumph, sidecar never taken off) replacements and repairs for engine have been three piston rings. There is now very slight play in the bearings, but rebushing is not yet necessary. Nearly all my riding has been done in the Dublin and Wicklow mountains and in North-Wales. I may add that I am the poorest of mechanics and hate tinkering; also never drive tyres to the bitter end.

CECIL BANCROFT.

#### The Wear of Small Engines.

Sir,—I am very glad to see that "Ixion" has introduced the subject of the wear of small engines for discussion in your columns, and I venture to submit my experiences.

My 2½ h.p. Douglas was new in July, 1910, and has now run 7,000 miles only. From the following list of replacements you will readily understand that the quick wear of the engine parts is a sore point with me. After 3,250 miles the makers prescribed two new cylinders and pistons, one new main bearing, tightening one big end, and a few sundries. Since then I have had another main bush, two more gudgeon pins, both big ends tightened and two new push rods. The valves have been very satisfactory, and only require attention at long intervals, but two inlet valves broke when almost new. After tightening the big ends (not at the maker's) one seized twice, and it seems only fair to conclude that these great shocks were the true cause of the

crankshaft breaking a few days afterwards. I am, however, still an advocate of the "vibrationless horizontal twin," but I do hope that if I go in for a 1913 model I shall not be troubled with such heavy repair bills.

Let us see what owners of 1912 machines have to tell us!

CLAUD MIDDLETON.

[Proper lubrication has a great deal to do with the wear of all engines.—Ed.]

Sir,—I notice that you are inviting readers to give their experiences with lightweights, respecting engine wear, etc. The following is an account of my 1911 2½ h.p. F.N.:

This machine has travelled about 8,200 miles; it has not yet had a bush replaced, the only renewals being a gudgeon pin and two new rings.

My journeys have been chiefly between London and Eastbourne (all weathers); and during the last 2,200 miles I have kept an accurate account of the petrol consumption, which averages 157 miles per gallon.

Since August I have carried a 9½ stone passenger (my weight 11½ stones) 1,200 miles. The engine has not been touched (except externally) since then, and to demonstrate that small engines do not necessarily require constant overhaul to keep them efficient, I went the other Saturday and climbed Westerham Hill, Cudham Hill, and Cudham Church Hill (1 in 4). These hills I had never previously seen, but I climbed them at first attempt.

I retained the F.N. carburetter, but converted it to double control.

D L. FLEXMAN.

A full blooded Chippewa Indian who has deserted his horse for the motor cycle. The machine belongs to an agent and the Indian uses it at every opportunity in preference to his old cayuse.

**Fair Treatment.**

Sir,—For some time past the clutch on my 1912 Douglas has never ceased to slip, and all attempts to improve matters having failed, I wrote to Messrs. Douglas Bros., asking them what they could do to remedy the trouble. By return, I received a reply from the firm expressing their regret that the clutch was unsatisfactory and offering me a new clutch, with pulley and gears complete, free of charge. There was, in fact, only the carriage of the goods to pay for. A few weeks ago the new clutch and gears arrived, but no sooner had they been fitted than it was found that the sliding rod, running transversely through the gear box, was too short to thoroughly disengage the clutch. Thereupon I again wrote the firm, and, by return, a new rod was sent, and now the clutch works as well as the other parts of their efficient motor. I venture to think that such generosity and promptness on the part of Messrs. Douglas Bros. is a matter other motorists might be glad to know of. I am consequently taking the liberty of asking you kindly to insert this letter in your paper. (Rev.) W. A. DOUGLAS HAMILTON.

**Transmission.**

Sir,—As a constant reader of your most interesting and instructive journal, I have noted with interest the numerous letters upon the vexed question of transmission. Until this year I was a firm believer in rubber belt transmission, because I had never ridden a motor bicycle with chain drive. I had read and heard so many objections to a chain drive that I took it for granted that these objections existed, and far outweighed their apparently few advantages. Last spring I bought a two-speed chain-drive lightweight Royal Enfield, and I cannot speak too highly both of the machine and its chain transmission. I have ridden the machine practically every day since its purchase, and the conclusion I have come to is that chain transmission—at any rate as fitted to the Enfield—is almost perfect. In over 3,000 miles I have on two occasions had to shorten the long single chain by pulling back the back wheel a small distance to take up the slight lengthening in the chain; the two short chains have only once required shortening—also a simple matter—and were done at one's leisure at home and not in the pouring rain. The above alterations were not at all dirty, as the chains did not require to be touched by the hands.

The tales of noise, jerking, and last, but not least, wear of back tyre, are all myths. The original back tyre is still being used, and I weigh between 13 and 14 stones, and, moreover, not infrequently have a passenger on the luggage-carrier—a pernicious habit, I grant.

From a medical man's point of view, it is a great comfort to have eliminated that bugbear of belt drive—slipping belt. Then, again, I find a chain drive so much cleaner—it does not fling the mud about like a belt. I am now a decided believer in chain transmission.

(Dr.) B. JACKSON-TAYLOR.

Sir,—At the beginning of this season I was inclined to favour chain drive because I had not tried it. Now I unhesitatingly plump for combined chain and belt drive both for solo and for sidecar work. I have two 1912 machines and some experience with a third. No. 1 has complete chain drive, with two chains to counter-shaft, and one behind. The rear chain requires adjustment every ninety miles, and the front chains every 300 miles. Life of chains is about 3,000 miles. I am somewhat sensitive to vibration, and, although this machine has a smoother running engine and a better spring fork than any other, together with a clutch that slips with the slightest jar, I find that three hours is the limit of enjoyable riding, which I attribute to the chain drive. The snatching of the chains at low speed is unpleasant.

No. 2 is a combined belt and chain drive. The chain is certainly the most troublesome part of the transmission, as it requires adjusting every 300 miles. The machine has run 1,600 miles, and the belt has never been touched, although every time the chain is tightened the belt is made slacker. I can ride all day on this machine without fatigue. On a similar machine last year I found the transmission excellent for passenger work. The life of the chain was 3,000 miles, belt 3,000 miles.

No. 3 is a motor cycle passenger combination, with one chain in front and two behind. The thump of the engine

can be felt by both driver and passenger, and the snatching and noise of the properly adjusted chains is unpleasant.

I note with interest that the Quadrant people are bringing out an 8 h.p. machine with combined drive, and I am of opinion that other passenger machines would be improved if a belt were substituted for the rear chain.

FLEX-DRIVE.

**The Arming of Motor Cycle Companies.**

Sir,—I have read the military motor cycling notes with great interest, and have nothing but good to wish them. I see it is advocated that each of the motor cycle companies should have twenty-five Rexers, and that the thirty-five officers, N.C.O.'s and men should be armed with Mauser pistols. This, in my mind, will be a vast mistake, as, unless you have a first-rate fire control—and you can only get that by prolonged and unceasing training—you will find that ammunition will run out and not be easy to replace. I have seen Rexers on active service, and they eat up a waggon-load of ammunition in no time. I would like to see the units armed with the regulation arm, as it is a well-known fact that magazine fire is not half so deadly as single fire—especially with young troops, who will pull away as hard as they can unless, as I said, they have had a long and careful training, and the military motor cyclist, I judge, will not be able to spare the time for this. I should not care to be the man on the saddle with my half-section dangling a Mauser pistol seated on the pillion in the event of an alarm being suddenly given right ahead.

C.R.L.

Zululand.

**Tyre Levers.**

Sir,—I enclose sketch of a lever designed for the removal of the back covers of machines fitted with dummy belt rims.

Fig. 1 shows the lever.

Fig. 2, the lever inserted between the bed of the tyre rim and the cover. This is done at a point which is clear of the mudguard, in order to allow the lever free play.

Fig. 3 shows the lever pressed down, the bead of the cover being free of the clinch before the lever comes into contact with the dummy belt rim.

W. PRETTY.

**The Courtesy of the Road.**

Sir,—I am burdened by an accumulating debt of gratitude for help and advice received on the road due to unknown gentlemen whom I cannot repay. I want to tell about it, if you will let me relieve my mind in your columns.

Let me explain. I am a 1912 novice, having bought my first motor cycle and sidecar in May last. I was quite unfamiliar with such things, having no mechanical knowledge or experience. Why, I remember the first time the driving belt came off I did not know how to replace it. I have now done about 2,000 miles, and have encountered most of the beginner's roadside troubles.

What I want to proclaim aloud is this. Never, day nor night, have I been in difficulties on the road but some brother motor cyclists have stopped to ask what my trouble was, and to render practical help, given freely and courteously, and with amazing patience. They have diagnosed the trouble that my inexperience could not detect, and, when the sooted plug, or broken valve, or tappets out of adjustment, or whatever it was, was located, I have been almost pushed aside while the matter was put right for me. And not only motor cyclists have helped me, for, on at least two occasions, motorists have stopped to take my passenger on to the nearest garage and send me help. I still have a sparking-plug lent me on the Brighton Road on the 5th October by a gentleman who said he would be at the Gloucester Hotel that night, but whom I failed to find there on arrival. At another time, when held up in the dark on a country road, a passing motor cyclist took my passenger and myself eight miles to the nearest town.

Belt guard and supporting plate for pannier bags on the 4 1/2 h.p. Singer.

If, sir, there is any other sport where such astonishing decency and good feeling are shown to beginners, I wonder what it is. I thanked all these gentlemen as well as I could at the time, and I thank them again. Each has always said, "That's all right," and ridden away. As it happened, in the case of the breakdown mentioned above, that my passenger was an American guest to whom I was trying to show something of our countryside, I was not a little proud that he also obtained such a favourable impression of the good feeling amongst British motor cyclists on the road, and I know he has not failed to take that impression home with him.

In conclusion, it only remains for me to say that I am trying to catch the spirit that has been shown to me. It was with peculiar satisfaction the other night that I assisted an absolute beginner to locate his trouble, and diagnosed it right (sooted plug) the very first time. "Amongst the blind the one-eyed man is king!" LE 2555.

#### A Long Journey on a Cyclecar.

Sir,—I should like to give my experiences of a long run in a Rollo cyclecar, as I think they will go to prove two very important points which a cyclecar, with any claims to be practicable, must have, namely, simplicity and reliability.

I decided to go to Birmingham, take delivery of my car at the Rollo Car Co.'s works, and drive it to Aberdeen, a distance of close on 500 miles.

Having never before driven a car (my motoring experiences being confined to two years of a motor bicycle), I received an hour's driving instruction from one of the mechanics at the works. So easy did I find the steering and manipulation of the clutch and speeds, that on the next morning, with the utmost confidence, I started off alone on my long journey. The front seat easily held my suit cases, so that I was absolutely independent. With easy running I arrived at Darlington in the afternoon of the second day, the only trouble being a small piece of grit in the jet; this took a very short time to put right and has not occurred again.

After leaving Darlington, the rain came down in torrents for the whole of the day, but I was extremely well sheltered by the hood, while there was no belt-slip of any kind.

North of Newcastle tyre troubles started; two bursts, the first caused by a piece of glass, and the second by a large nail. However, thanks to the four wheels, the covers were easily removed and repairs made. After reaching Scotland, I had no further troubles of any kind and easily did the 220 miles from Berwick through Edinburgh, Stirling, and Perth to Aberdeen in two days.

During the whole run I had only to touch the engine once to replace a sparking plug. There was absolutely no overheating, and the oiling arrangements (exhaust pressure feed) were admirable.

The belts had only to be adjusted once, two links out of each. Since then I have only had to take out one more; in fact, three links in close on 800 miles. The three-point suspension of the car is admirable. The roads in places could not have afforded better tests.

c28

The improvement over a motor cycle and sidecar is immense; handy in traffic, with speed sufficient for most people, the Rollo cyclecar in reliability, simplicity, and comfort (that is in springing and protection against dust and rain) is far ahead of any motor cycle combination I have seen, and all these advantages are obtained at very slight extra initial cost and expense in upkeep.

J. F. MACDONELL.

#### Tyres and Tyres.

Sir,—We notice that your correspondent, "Roadside Solutioner," complains that he has not yet found a satisfactory tyre for heavy work, and we can only come to the conclusion that he has been unfortunate in his choice. We think it a pity that he should have felt constrained to utter such wholesale condemnation, and, under the circumstances, we trust you will allow us sufficient space to draw his attention to at least one make, of which, apparently, the extraordinary merits are not sufficiently known. This tyre, the Rom, has a very heavy tread formed by combination of rubber bars and steel studs, these being placed alternately.

Every motor cyclist to whom we have recommended this make has been most enthusiastic about the results obtained. One rider of an 8 h.p. two-speed machine with sidecar found no appreciable signs of wear on the back wheel tyre after it had been 2,500 miles, and for the first thousand he had no occasion to use a pump. HITCHINGS, LIMITED.

Sir,—I shall be glad if you can find space to insert my reply in your paper, *The Motor Cycle*, to "Roadside Solutioner," who must have had cheap covers or else is a bad driver, because I have just done 1,000 miles on my 5-6 h.p. V.S. and sidecar, having been through Lincoln, Yorkshire, etc., covering up to 137 miles in a day, and have not had one puncture or even had to pump up my tyres, which are 26in. x 2 1/4in. Palmer cords, and am pleased to say are good for at least another 2,000 miles, as the rubber studs are not worn smooth; this proves that all tyres are not the same as "Roadside Solutioner" buys, and as I have no interest in any tyre company I cannot pass his remarks without a murmur, but advise him to give these tyres a trial. Then, perhaps, he will have a different opinion.

GEO. BENNETT.

#### THE CRAVEN PATENT FOUR-SEATED SIDECAR.

A four-seated sidecar is somewhat of a rarity, and its introduction was due to the exigencies of the growing family of its designer, who can now take out his wife and four children. The body has side doors, is coachbuilt, and

An interesting type of family sidecar.

of not unpleasing design, while the upholstery is comfortable. The machine, which, like the sidecar, is built by the Craven Motor Co., 116, Greenwood Road, Dalston, is propelled by a 9 h.p. J.A.P. engine, and has a three-speed Chater-Lea gear box, multiple disc clutch, and 650 x 65 mm. Dunlop tyres.

Valve side of the Bradbury, with two-speed engine shaft gear.

## BRADBURY.

The standard Bradbury for 1913 will, in all essentials, remain as heretofore, and still have an engine of 89 mm. bore and stroke, but the side flaps on the front mudguard will extend right to the front, and a belt guard will be fitted. The two-speed belt-driven model will be fitted with an engine-shaft gear made by the Bradbury Co. and a kick-starter. Special heavy 2 $\frac{3}{4}$  Dunlop tyres will be standard. There will be two models fitted with the Bradbury counter-shaft gear, one with chain drive throughout and the other with combined chain and belt, both having a new gear changing device. In these machines it is worthy of especial note that the transmission will be fully guarded and the chain connected with the kick-starter enclosed in a case. The Sturmey-Archer or Armstrong three-speed hubs will also be supplied. The Druid forks will have improved springs. Four models of sidecars will be marketed, one having a coach-built body of three-ply, wood finished in French grey or dark green.

L.M.C. kick starter, high speed clutch and operating mechanism.

## CORAH.

A recent call at the Corah works at King's Norton established the fact that this firm will fit J.A.P. engines exclusively next year. The T.T. 3 $\frac{1}{2}$  h.p. model will be supplied either with the 85x85

mm. or 90x77 mm. J.A.P. and overhead mechanical inlet or side by side valves. The 6 h.p. twin sidcar model will be fitted with the Rigby two-speed gear, which is of the selective clutch type, the standard ratios being 4 $\frac{1}{2}$  and 8 to 1. The lugs for sidcar attachment are brazed to the frame, and the Corah Co. will make their own sidcar. The frame improvements include double tubular chain stays, the lower stay being extended and attached to one of the lower crank case bolts. The ball head is one inch longer than before, and the lower rail is of D-shaped tubing with the flat portion uppermost; this allows half an inch more head room for the cylinder. The tanks of the single-cylinder machine are half an inch wider, and those of the twin model three-quarters of an inch wider. A feature of these machines is the foot-operated oil pump; this is made for the firm by Best and Lloyd, and is charged by depressing a pedal hinged to one of the crank case cradle bolts. The pedal

is connected by a rod to an eye at the bottom of the pump plunger, and this latter is returned by spring pressure, the oil flow being regulated by an adjustable needle valve. The action of the pump plunger is the reverse of the usual type, viz., the plunger descends to charge the pump barrel and ascends to feed the engine.

## BROUGH.

Two types of motor bicycles only will be produced in 1913 by W. E. Brough and Co., of Basford, Nottingham, viz., a 6 h.p. twin and a 3 $\frac{1}{2}$  h.p. single. The twin-cylinder engine has a bore of 77 mm. and a stroke of 88 mm. The cylinders are very clean castings, and an air passage

Geared down clutch pedal on the new Triumph.

is left between the valve chests and the cylinder. Very large valves having 1 $\frac{1}{2}$  in. ports are fitted. The timing gear is unusual, as the gear wheels are set one above the small crankshaft pinion and one directly below. By this means one cam operates both inlet valves, and the other both exhausts, so that the inlet and exhaust valves are synchronised on both cylinders. The big end bearings are set side by side and are of large diameter.

The 1913 model 3 $\frac{1}{2}$  h.p. Bradbury chain and belt-driven machine.

(1) Belt side. (2) Valve side of the new model 6 h.p. three-speed Brough. A starting handle is fitted.

The flywheels are of large diameter, and the magneto platform is cast with the base chamber. The Senspray carburetter will be a standard fitting, as also will the Sinms magneto.

Transmission is by lin. belt and Armstrong Mark VI. gear. This gear gives a

riding position, a ground clearance of 4½ in. is obtained below the crank base.

The control for the gear change is fixed to the lower rail so that the lever is not liable to be damaged. A finger adjustable pulley is supplied which enables one to alter the ratios in a few seconds. Another important item is the inlet pipe which is cast and fixed with bayonet joints, particular attention being paid to the prevention of air leaks. The neat arrangement of the machine will be noticed from the photographs. The engine

be obtained, the chief alteration being that it has a fixed gear instead of the three-speed hub. All models have enclosed brake cables, and three lengths of piston can be ordered—high, medium, or low compression.

Method of holding down cylinders on new 3 h.p. twin Enfield.

direct drive on top, and the engine is started by a handle, which rotates the driving gear through the medium of a short chain. The frame has a dropped top tube, and is designed to give a very low seat position, the actual height to the top of the saddle being 29½ in. Druid forks are fitted, and the carrier has special lugs for supporting the pannier tool-bags and the pump. The front mudguard has side extensions for its full length, and is supported by flat stays. There are no stays on the rear guard to interfere with tyre changing, as it is supported by the carrier. The tank has a capacity of one and a half gallons of petrol and three pints of oil. Lubrication is by means of a ball valve pump, a tap also being fitted to prevent waste. Though held from the top, the tank is very securely fixed and the seams are double. In spite of the low

The Wulfruna pedal starting mechanism.

pulls well and runs very smoothly, and our readers will remember the fine reliability records set up by Mr. G. Brough in various trials throughout the year.

The 3½ h.p. model has a bore of 85 mm. and stroke of 88 mm. and a shorter frame, but in other respects resembles the twin. A T.T. type of each model can

Clutch operation and chain cases on the new Clyno.

## N.S.U.

Ever since the N.S.U. motor cycle has been sold in England, its manufacturers have made a careful study of English requirements, so that, notwithstanding the fact that it is made abroad, the N.S.U. has always met with a favourable reception in this country and its colonies. The new models are the 3 h.p. twin and the 3 h.p. single. The motive power of the former is a twin-cylinder engine with horizontal radiating fins, bore and stroke 58×75 mm. The magneto, the waterproof Bosch, is gear-driven, and is placed in a protected position behind the rear cylinder. The cover of the transmission gearing, which is a particularly neat job, forms part of the cover of the distribution gear chamber. The chief novelty is the new double lever control carbur-

## THE 1913 PATTERN N.S.U. CARBURETTER.

Air and throttle controls on the handlebar. They open inwards.

FIG. 2.

Section of spring controlled throttle and air pistons operated by Bowden cables.

FIG. 3.

Section of the N.S.U. carburetter, showing float agitator, petrol pipe union, and jet.

FIG. 4.

Exterior view of complete carburetter.

The latest N.S.U. twin-cylinder engine and carburettor.

etter. Last year the N.S.U. carburettor had a single lever, but, owing to the request of riders, the makers have reverted to the double control, as they feel that more perfect results can be obtained thereby. As will be seen from the accompanying illustration, the flow of oil and gas is restricted by means of piston slides, all the air being controlled from below the jet. Both tappets are adjustable, while footrests and a pedal-operated cut-out are now fitted. Large filler caps are now supplied. The frame has the top tube slightly dropped at the rear; the engine is carried in a loop. The hinder portion is sprung as before, and the excellent spring forks are retained. The N.S.U. gear remains unaltered, except that a slightly stronger type is fitted to the  $6\frac{1}{2}$  h.p. twin for sidecar work. Another new model is the 2 h.p. single,  $50 \times 72$  mm. Both this and the 3 h.p.  $73 \times 78$  mm., single, which we illustrate herewith, are practically identical as regards the details we have described, except that the 2 h.p. model

is supplied with a Ruthardt magneto and a coaster hub brake. It is interesting to note that the brakes on all the other models act on the rear wheel; that bearing on the belt rim is shod with wood, while the band brake, introduced during the latter part of last year, remains the same as

Drilled steel piston tested on the A.J.S.

before. The lightweight N.S.U. models may be purchased fitted with an adjustable pulley, an under-geared pulley, or a two-speed gear.

### O.K. SIDECAR.

The chief departure in next year's programme of Messrs. Humphries and Daws is the addition of their existing models of a 6 h.p. chain-driven twin-cylinder sidecar

System of rear springing adopted on the O.K. sidecar.

combination. This machine will be fitted with a two-speed gear of a simple type, which, by means of expanding clutches, engages either a high or low gear chain. A shock absorber is also fitted to the rear driving sprocket. The engine is a 6 h.p. J.A.P., and the frame and fittings are particularly neatly carried out. The tank, which is enamelled all over, is supported on lugs brazed to the lower rail, and is fitted with a Best and Lloyd semi-automatic lubricator and large hinged filler cap. The Amac automatic carburettor will be fitted as standard, and a Bosch magneto supplies the current. Attached to this machine is a sidecar of unusual construction; the sidecar side members are bent in a long sweep which follows the lines of the body, and across the rear lies a tubular member. This forms a long bearing for a cross-shaft, which carries at each end a bell crank lever, one arm of each being attached to the body, while the

Shoes and cam of A.J.S. internal expanding brake.

other arm is connected to the frame by a coil spring, thus giving a very comfortable suspension. The front is suspended on a small check spring. Besides this model, there will be T.T. and tourist models fitted with a single-cylinder  $85 \times 88$  mm. engine and a  $2\frac{3}{4}$  h.p.  $70 \times 90$  mm. lightweight. All these machines are carefully finished, and much attention is given to details.

The big single-cylinder three-speed Excelsior, a bicycle particularly suited for sidecar work.

## TRIUMPH.

Six patterns of Triumphs will be marketed during 1913, all as usual possessing the same type of power unit. The 85 x 88 mm. engine has been very little altered, though it has been found by reducing the size of the port opening that the possibility of fouling the plug has been almost eliminated.

The two new models adopted are a Tourist Trophy model with free engine clutch in rear hub and a three-speeder, the gear used being the Sturmev-Archer hub gear.

We have been privileged to test one of the three-speeders on the road, and can speak in high terms of the new silencer design.

Encased ratchet of the Triumph gear changing mechanism, also showing petrol indicator at top of tank.

So far as the rider is concerned, the exhaust being swept to the rear of the machine renders the driving much more pleasant, especially on a long run, for the continual "pop, pop, pop," which becomes so irritating to some on a long day's ride, is noticeably absent.

Top of Triumph new tank. The dial showing the amount of spirit in the tank can be seen by the rider when in the saddle.

Amongst the special points which have received attention in the new models are several important ones making directly for the general convenience of the rider. First of all there is the new gear lever arrangement, two sketches of which are

1913 model T.T. Roadster Triumph.

Extra wide mudguard on the 1913 Triumph, doing away with the necessity of a shield over the magneto.

given. The lever, which is ball-headed, is of good size, and conveniently placed alongside the tank on the right-hand side and almost immediately above the engine. The shaft of the lever is carried on a bracket on the lower horizontal tube,

which, as shown in the second sketch, terminates in a circular ratchet and pawl device, and is neatly covered in with a dust cap. The dimensions of the device are thoroughly sensible in every part, and, while it works quite easily, the ratchet provides that the accidental slipping of one gear to another is absolutely prevented. The petrol gauge, consisting of a clock dial carried under the glass lid of the petrol filler cap, will be noticed in the first sketch of the gear lever. The Sturmev-Archer hub gear is used, and for the control of the clutch of this, a special toe-and-heel pedal, working on the dead-centre principle, has been designed. In this attention has been given to providing means whereby the clutch engage-

The large change speed gear lever adopted by the Triumph Co.

ment can be performed exceedingly gently and progressively. The sketch shows what a large amount of leverage is available. The brake mechanism, as applied to the rear wheel, has also been redesigned, and, as shown in the sketch, now contains nothing but straight-pull links. The first link from the pedal itself is placed between the belt pulley and the crank chamber, and is connected to a cross pivot which runs through to the further side of the machine, and there operates the brake through a crank and a second straight lever.

In the Triumph engine itself very few changes have been made; adjustable tappets are provided, and work on a simple screw principle with a lock nut. A very good point, however, is the provision of a special washer to keep out mud and

The new three-speed Triumph, which has a special design of gear changing lever.

## New Models.—

Crank case washer on the new Triumph to prevent escape of oil.

dust from the ball race of the crankshaft at the pulley side; a section of the crank chamber at this point is given, showing how the leather washer is specially formed so as to tend to grip the shaft. The washer is shown in the sketch in black, and is held in position in the housing by a left-hand

threaded nut.

The mudguarding arrangements on the front wheel of the new models is very complete, a deep wide flap of the form shown in the sketch being fitted to the front wheel. This acts so well that any further mud-shield for the magneto, etc., becomes unnecessary.

2 3/4 in. covers have been adopted as standard on 1913 Triumphs, which will undoubtedly prove a great convenience in the long run, and should prove more comfortable and give greater mileage than the smaller section.

### REX-JAP.

It is expected that the largest demand next year will be for machines fitted with the 6 h.p. (76 x 80) and 8 h.p. (85 x 83) side by side valve twin-cylinder J.A.P. engines. A new type of single-cylinder J.A.P. engine, 85 bore x 95 stroke, with mechanically operated overhead inlet valve, will also be fitted.

The frame has been strengthened at the ball head, which is considerably longer, and the steering rake has been increased. The sidecar lugs are brazed solid with the frame, thus ensuring correct alignment and longer life for the back tyres. The sidecar has four point attachment and vertical coil springs in addition to the usual Cee springs. The bodies are made in two types—one a torpedo coachbuilt

The Rover Co. has added a sidecar to its range of models. We illustrate above the chassis design. Observe the band brake, stand, and long Cee springs.

body, painted to match the machine, and the other a torpedo solid cane body. The springs in the upholstery of the body and the special springs on the chassis insulate the passenger from all vibration.

The tank has been improved by having the corners rounded off. The petrol capacity has been increased to two gallons. The oil tank is fitted with a small air pump, which is used to raise a pressure in the tank of about 5 lbs. per square inch. This forces the oil under pressure through a sight feed drip lubricator on the top of the tank, where the flow of oil can be regulated by a hand-controlled needle valve.

Every machine will be fitted with a belt guard, which extends round the engine pulley and underneath the belt to the rim. The mudguards have been improved, and the side flaps extend right round the front mudguard. This is an excellent point. Front wheel stands will be fitted to all models.

The gear is unaltered, except that the low gear contracting V shaped band has been replaced by a flat one. The leverage on the foot brake has been increased. The cantilever springing for the saddle pillar and comfortable rubber-covered footboards ensure the comfort of the driver.

### CALTHORPE.

The Calthorpe models for next year will be three in number, viz., a 4 1/4 h.p., a 3 1/2 h.p., and 6 h.p. twin. The last named is being specially constructed for use as a sidecar combination, for which purpose lugs have been permanently brazed into the frame.

It will be fitted, as with the other models, either with a two-speed Calthorpe counter-shaft gear, complete with kick starter,

1913 Calthorpe two-gallon tank and detachable sump filter.

and driving both by chain and belt, or with an Armstrong three-speed gear, or with the usual single gear.

Several important improvements have been made in the 6 h.p. model. To start with it has a really sensible sized tank, holding two gallons of petrol and three pints of oil. A sketch of this is given, showing its nicely rounded sides, the Best and Lloyd drip feed lubricator, and also the petrol sump and filter—a special feature. This last is also illustrated in detail, and has the advantage that the last drop of petrol is used from the tank, whilst should water get into the petrol one can ensure that upon emptying the tank it gets away. The filler caps are of the screw-down type, and that of the petrol tank has a glass lid. Druid forks are standard.

Practically no change has been made in the Calthorpe gear, which is driven by a chain from the engine and then transmits through a belt to the back wheel, except the provision of an adjustable belt pulley. The rear chain stays in all models are made sufficiently wide to allow a hub gear to be fitted to the fixed gear models at any time and without structural alteration should a change be required.

How the 6 h.p. Rex-Jap sidecar model will appear in 1913.

## NEW HAZLEWOOD.

As mentioned in our last issue, the Hazlewood Co. have produced a new model with an Armstrong Mark V gear in the bottom bracket. The fitting has been particularly neatly carried out, and the gear is mounted in eccentric trunnions to allow for front chain adjustment. One of these trunnions has a serrated outer edge which effectively prevents the adjustment from slipping. A chain connects the gear to the engine, and is enclosed by a quickly detachable aluminium casting. The engine is a specially constructed twin J.A.P. of 70 mm. bore by 76 mm. stroke; it has extra large flywheels to ensure smooth running and an oil well on the timing side. The fittings of the motor cycle are little altered but two points are worthy of notice. The rear rim on which the brake shoe works is now made in the form of an inverted V, so that the wheel may be detached without disturbing the brake-gear. The second interesting point is that the rod actuating this brake is supported in the middle by a bracket, which also forms a spring stop for pulling it off the rim. This machine is sure to attract a considerable amount of atten-

Valve side of new twin Hazlewood, with counter-shaft gear.

tion for sidecar work. The engine, which is being made throughout at the Ariel works, is 83 x 88 mm. bore and stroke. The valves are side by side, and the cylinders are set at an angle of 60°.

The drive is by chain throughout, a two-speed selective friction clutch gear taking the place of the usual counter-shaft. This is operated by a quadrant lever on the tank. The machine is built especially for sidecar work, and has lugs especially for this purpose brazed into the frame. A handle-starter is provided.

Belt side of the new twin Hazlewood which has an Armstrong three-speed gear in the counter-shaft.

tion, as we have frequently heard the desire for a three-speed counter-shaft gear expressed. Its obvious advantages are accessibility, neatness, and the possibility of using a large belt pulley. Its disadvantages are considerably harder to discover.

## ARIEL SIDECAR.

The principal introduction for next season which this firm are making is a 7 h.p. twin machine, designed especially

Ariel adjustable footrest. Different lengths to suit tall or short riders are now obtainable.

The kick-starter fitted to 1913 Ariels.

In the 3½ h.p. Ariel machine using an Armstrong three-speed hub a kick-starter is now included. It is, as can be seen, very neatly arranged, and has its pedal in a very convenient position.

A SINGLE-CYLINDER SIDECAR MODEL.

New 3½ h.p. Premier fitted with the company's counter-shaft two-speed gear. An enclosed chain transmits the power to the gear, a 1" belt being used for the final drive.

**THE NEW 2½ H.P. TWO-SPEED SUNBEAM WITH OIL BATH CHAIN CASES.**

2½ h.p. two-speed Sunbeam, a newcomer for next year.

**SUNBEAM.**

is week we took the opportunity of  
ing one of the 1913 2½ h.p. Sunbeam  
es, and were particularly impressed  
its clean and workmanlike lines.  
hole of the transmission and kick  
is enclosed, rendering it practically  
the proof, in addition to which the  
old model will be finished in black  
out, that is to say, black celluloid-  
handle-bars, black hubs, and  
spring fork fittings, which latter  
most important point, as they are  
awkward to clean. The edges of  
is are, of course, plated where the  
shoes touch, but this is almost the  
point liable to rust. The tank also  
is, finished with broad gold lines.  
it be imagined that this would give  
any appearance to the machine, but  
not so, as we can say after seeing  
ished article.

**The Motive Power.**

h engine has a bore of 75 and a  
of 79 mm., and has a clean compact  
ence. The crankshaft is fitted with  
m roller bearings, which, of course,  
ne and not point contact. Adjust-  
ppts are fitted, and the cams are  
external type. A striking point is  
se of the timing gear bearings, which  
ide of cast iron which has particu-  
ood wearing qualities. The valves  
ge for the size of the engine, having  
port diameter of 1½ in. From the  
at port a 1½ in. outside diameter pipe  
also a large silencer, which consists  
expansion chamber from which the  
escapes through a series of ¾ in.  
e. The flywheels have eccentric  
for balancing purposes, and the  
on pin is hollow and driven into a  
two-ring piston, and prevented from  
ing the cylinder by copper studs.  
are type enclosed Bosch magneto lies  
hip behind the engine, and is gear-  
through a short train of gears.  
the end of the crankshaft lies a  
g sprocket half by a spring between  
erodo faced plates, which act as a  
g clutch to take away the harsh-  
of the chain drive. A Hans Renold  
transmits the power to a multi-  
clutch on the counter-shaft, and

thence through a neat two-speed gear of  
the sliding dog type to a sprocket on  
the offside of the machine, and finally by  
chain to the rear wheel. Behind the  
clutch a kick starter of the wheel and  
quadrant type is mounted, and both chains  
and starter are enclosed in quickly de-  
taenable oil bath cases.

**Tyre Repairs Easy.**

The rear wheel is mounted on a divided  
axle, so that by detaching a central bolt  
and a distance piece the air tube may be  
removed entirely without dismounting the  
wheel from the frame. The adjustment of  
the front chain is carried out by sliding  
the gear box, which, however, cannot come  
out of line. The rear chain is adjusted  
by moving the rear wheel backwards;  
26×2½ tyres are fitted, and the machine  
is protected from mud by extensions on

Sunbeam back hub, showing the divided axle.

each side of the rear guard and side  
flaps on the front guard. All Bowden  
wires are enclosed in the handle-bar, in-  
cluding that from the hand-operated clutch  
lever. The tank is supported from below  
and is fitted with large filler caps and a  
Bost and Lloyd sight feed drip. The  
filler caps have large gauze strainers  
within. The carrier is welded into one  
piece and carries pannier tool bags; the  
machine is finished off with neat rubber  
covered footboards. On the road we  
found the machine quiet, flexible, and  
powerful, while the manipulation of the  
change-speed is very simple. In all we  
consider the machine a very handy and  
serviceable mount, which should still  
further enhance the high reputation of  
the makers of Sunbeams.

The Sunbeam engine, showing timing gear.

Removing air tube from back tyre through divided axle.

## 1913 CANOELET.

The popular Canoelet sidecar, made by Messrs. Mead and Deakin, of Ladypool Road, Birmingham, has undergone a few slight alterations for 1913. The frame now has a square front, and the attachments have been somewhat improved; notably the rear fixing which has an additional stiffening piece. The body itself follows the popular lines of its predecessor, but is now fitted with comfortable unholstered arm rests. While in the works we inspected a most interesting form of friction driven cyclecar, but this is entirely in the experimental stage, and we were asked to give no details of its construction at present.

Efficient sidecar chassis; the framework is exceptionally strong and it is impossible for it to get out of alignment.

A clever sidecar attachment on the new Calthorpe showing details.

## THE FORWARD.

M. J. Varley, 57, Stoney Lane, Sparkbrook, Birmingham, has introduced several improvements in connection with the Forward sidecars. Four-point suspension has been adopted, the chassis is lower, and the front and rear springing are separate, the rear springs being carried on the main outer tubes. The four diagonal tubes between the sidecar and motor bicycle are straight, and steel forgings are used for all the attachments. Luggage carriers can be fitted to all models, and a spare petrol can holder is also supplied to order.

Latest design of Canoelet sidecar made by Mead and Deakin. The body is deeper and the back higher than formerly.

M. J. Varley's latest design "Forward" sidecar, which will be seen at Olympia.

## DUNHILL'S SIDECAR.

Many people who have sidecars require to carry a small child as well as the passenger, and this has been overcome in the sidecar body lately introduced by this firm. The seat has been neatly incorporated into the body, so that the child does not encroach upon the room occupied by the adult. The sidecar has received careful study at the hands of this firm.

A special sidecar attachment, by Alfred Dunhill, Ltd., showing luggage-carrying capacity.

Light Four-wheelers which come within the Cyclecar Definition.

La Violette has performed very satisfactorily in French competitions this year. It is sold in England by Mr. Jacob, 13, Grape Street, New Oxford Street, W.C., and is fitted with a single-cylinder water-cooled engine  $80 \times 140$  mm. The magneto is a U.H., and the carburetter a Claudel. Internal flywheels are employed, and the compression is moderate. The inlet valve is automatically operated; the water-cooling is by thermo-syphon with very large water spaces. Lubrication is assured by means of a sight feed drip

Rear portion of La Violette chassis, showing springing, friction wheel bearing on disc, also long chain drive to axle.

Single-cylinder engine of La Violette, a friction-driven, French cyclecar. Oils are the long mainshaft bearing and friction disc.

lubricator. It will be noticed that the rear portion of the crankshaft is exceptionally long and provided with bearings to take up the thrust of the friction drive.

On the shaft is keyed a large diameter friction plate; the surface is polished, and the back of the plate is strengthened by ribs. The friction wheel is on a cross-shaft, and is made narrow and covered with a special wear-resisting material. To change gear the friction

wheel is moved inwards towards the centre of the disc to lower the ratio or outwards towards its periphery to provide a higher gear. The friction wheel is kept in close contact with the disc by means of a compression spring, and before changing the friction wheel is withdrawn from the plate by a pedal which takes the place of the usual clutch operation.

The power is taken from the friction wheel cross-shaft to the rear axle by means of a single chain running over jockey pulleys. The rear axle has no balance gear, but one wheel is keyed to the shaft and the other is connected to it by a friction disc, and it is claimed that one wheel can over-run the other when turning corners.

The main members of the frame are of wood strengthened with flitch plates on the outside and strutted by cross bearers of channel steel. Quarter elliptic springs are used fore and aft, and there is a cross spring in front. The brakes are internal-expanding on the rear wheels.

Among the latest refinements may be mentioned coil springs to the steering connections and brake connections, detachable wheels, and complete metal undershield.

Our representative had a trial run on one of these vehicles, when it carried three passengers, and performed satisfactorily. The humming noise from the friction gear was slightly more pronounced than some other friction-driven cars we have tried, otherwise there was nothing to complain of. A racing car of this make is said to have accomplished in a timed trial on the road a distance of twenty-four kilometres in 14m., and also to have climbed a gradient of 22%, which equals about 1 in  $4\frac{1}{2}$ .

## The Metropolitaine.

Although rather close to the cyclecar and small car border line, this vehicle is worthy of attention. It has a four-cylinder *monobloc* engine  $60 \times 120$  mm., three speeds and reverse, balance-geared back axle, and pressed steel frame. The makers employ the U.H. magneto and Claudel carburetter. The wheelbase is 7ft. 10in., and the track 3ft. 11in. Wood or wire wheels are fitted. The crank case, gear box, and clutch form one unit, and the machine presents a very neat appearance. It is made by Cochez et Jeanne, Puteaux, near Paris.

## A Cyclecar with Rotating Valve Engine.

The voiturette C.L.C. is rather over the border line of a 6 cwt. chassis, but as it will be considerably reduced in weight for 1913, we think a description of the engine and one or two illustrations will interest our readers.

The C.L.C. is made by the company of that name at 165, Avenue d'Italie, Paris. The engine, which is called valveless, is a rotating valve engine made under Da Costa patents. The rotating valve consists of a sleeve outside the piston, which is rotated by gearing driven off the engine-shaft by a chain. The ordinary working piston reciprocates inside the rotating sleeve, the result being that, with suitable ports cut in the cylinder for inlet and exhaust, which register with other ports cut in the sleeve, the gas is induced and exhausted through the ports when the holes in the sleeve register with the holes in the cylinder.

The complete Violette friction-driven cyclecar. The weight of this vehicle, as illustrated, is under 7 cwt.

## Some Continental Runabouts.—

To enable the sleeve to revolve easily and to prevent any undue friction on the walls of the cylinder it is supported on a double ball bearing. That the engine

is not inefficient is proved by the trial made on August 9th last by the Automobile Club of France, when a C.L.C. standard engine, 80 x 140, running at 2,188 r.p.m., gave 11 brake horse power. This, the makers claim, is approximately 25% more than can be obtained from a similar engine with poppet valves. The rotating sleeve extends, of course, right up into the combustion head, and the compression is there retained by means of suitable rings. Lubrication is by a mechanical oiler in the scuttle dash, separate leads being taken to the base of the crank case and also to the mechanism by means of which the sleeve is rotated. On the present type of vehicle the gear box is in one with the crank case, but it is the makers' intention for next year to move the gear box to a position midway between the rear axle and the engine, as the construction at present is rather heavy. The weight of the chassis is 800 lbs., but the makers are contemplating a lighter model with air-cooled cylinder, as they are confident, owing to the cool running, that it would be quite successful as a motor cycle engine.

Incidentally, they are on the look out for an English firm who would like to take up the engine for motor cycle work and make it under royalty; they are prepared to carry out the necessary experiments required over and above those made for the water-cooled type and to build the first engine. Firms interested in this proposition should address enquiries to C.L.C., c/o the editor.

C.L.C. rotating sleeve valve engine.

The Globe voiturette. This neatly designed runabout has a flat belt and single chain transmission. The final chain drive runs in a metal case.

## The Globe.

The Globe, which is the name of a cyclecar sold in England by Globe Cars, Ltd., 37b, Duke Street, W., is an ingeniously designed four-wheeled voiturette, known in France, its country of origin, as the Sphinx. The latest type is illustrated herewith.

The vehicle differs from others in the design and construction of the transmission, which is distinctly ingenious. In front, under a bonnet, is placed a 9 h.p. single-cylinder Aster engine. This transmits its power to a counter-shaft by means of a flat leather chrome belt four inches wide. The counter-shaft has on it a pulley, and in the centre of this pulley is an epicyclic gear which runs solid on the top ratio and comes into action only when the low gear is required. The drive from the counter-shaft to the rear axle is by one chain, which runs in a chain case. The clever part about the device is that the counter-shaft is interconnected with the rear axle, and the axle, with its chain transmission and the counter-shaft, can all be moved slightly towards the engine-shaft, so slackening the belt and enabling a change of gear to be made. The axle and counter-shaft are then moved back to their original position and the belt can also be tightened by this device if necessary, although a protected

flat belt, when run in, seldom requires any shortening. The change of speed is effected by means of positive clutches, the teeth of the dogs being used to lock the central sun pinion of the epicyclic gear. The movement of the back axle is effected by means of a long lever, which is operated quite easily when the vehicle is in motion, and the belt gives a very supple form of transmission to the gear and the back axle; one rear wheel only is driven. The 9 h.p. Aster engine is of rather heavy construction, and we think if this vehicle were made with a lighter multi-cylinder engine or a single-cylinder engine specially designed for cyclecar work, with large outside flywheel, the vehicle would be still more enticing. The 9 h.p. Aster engine is made for a much heavier type of car than the one under discussion, and our reason for pointing out that a lighter multi-cylinder engine would improve the vehicle is because the weight of the engine used adds considerably to the weight of the vehicle.

The frame is made of ash bars, strengthened with steel fitch plates, and the rods connecting counter-shaft and rear axle serve the purpose of torque rods as well as connections between these two portions of the vehicle. The engine is started by a handle which fits on to a starting clutch behind the front wheel. The method of springing is unusual. The frame is made rather narrow, and the springs are fitted at each side in such a manner that the frame is able to go down below the springs when the latter are depressed. Although the writer did not have an opportunity of trying this vehicle on the road, he was informed by the makers that it steers and holds the road better than ordinary types, because the gyroscopic action of the flywheel is in the direction of travel. The engine is placed with its axle across the frame, so that all the transmission shafts are parallel, a feature which must lead to efficiency.

Sliding under-carriage of the Globe runabout. The wide flat belt from engine to countershaft will be clearly seen, also the dog clutches for operating the epicyclic gear in pulley.

# PALMER

## MOTOR CYCLE TYRES.

Palmer Motor Cycle Tyres are now made in three types. The first with the patent "Airless" Cord, called the Cord Tyre, the second with four layers of Fabric, called the Palmer Heavy Fabric Tyre and the third with two layers of Fabric, known as the Palmer Ordinary Fabric Tyre.

The Palmer Fabric consists of parallel threads of extraordinary strength, each thread being thoroughly insulated with rubber, rendering the fabric practically impervious to moisture. The woven canvas used in most other tyres does not possess this feature to the same extent as the Palmer Fabric, with the result that it is more liable to rot if a gash or puncture occurs in wet weather and water enters the breach.

The Palmer Cord Tyre is extra strong, and constructed on similar lines to the well-known Cord Motor Tyre, which has gained so many successes on road and track.

Every Motor Cyclist should know that there is a vast difference between Palmer Cord Tyres and all other Motor Cycle tyres. Instead of three layers of canvas, the foundation of a Palmer Tyre consists of two layers only of cotton cord, impregnated and coated with the finest rubber. Canvas as the backing or foundation for a tyre has many defects. It rots, for one thing, and being a woven fabric of coarse manufacture, the cross threads cut one another.

## GETTING BUSY FOR THE OLYMPIA SHOW.

### OUR STAND

is being prepared for the exhibition of all the latest improvements in

**MOTOR CYCLE ACCESSORIES,  
CLOTHING, AND EQUIPMENT.**

It would be impossible to attempt to give here, even a small description of the many good things we shall have ready to show you at the

### OLYMPIA.

Our Stand will be in the corner of the Gallery, as usual.

We have pleasure in making this preliminary announcement and extending

**A CORDIAL INVITATION**  
to all old customers and friends to meet us there.

We hope to see also those to whom the pleasures of Motor Cycling are as yet unknown.

Advice and information for beginners freely given at **DUNHILL'S.**

**DON'T FORGET!**  
**The STAND NUMBER**  
**IS———171.**

Get our NEW Catalogue before the Show Opens or look in at  
**359-361, EUSTON ROAD, LONDON, N.W.**

Manchester: 88, Cross Street.      Glasgow: 72, St. Vincent Street.  
City Branch: 42-43, Lombard Street, E.C.

Some Continental Runabouts.—

A new French cyclecar, the Meyer, which has an 8-10 h.p. Anzani engine, channel steel frame, Lanchester springs for and aft, chain and belt transmission with sliding back wheels and brake blocks acting on belt rims. It weighs 5 cwt., approximately, and is said to be capable of 50 m.p.h.

### A Single-cylinder Runabout with Large Outside Flywheel.

A little voiturette which will in all probability be seen in English competitions next year is the Parent, made by the firm of Parent et Cie., Paris. A call at their works recently elicited the information that they intend to make one thousand of these little vehicles, and have already put on hand one hundred, the parts for which were sawn in the factory. Illustrations of the machine appear on another page of this issue. The engine is a single-cylinder  $100 \times 140$  mm., and gives 6 h.p. at about 500 r.p.m. The cylinder is offset, and water-cooled by thermo-syphon system. It has a three-speed gear box, which is of the sliding type with three speeds and reverse, as in an extension of the engine crank case so that the engine and gear box with magneto are what the French style *en bloc*. The flywheel is carried in front of the engine just behind the bonnet, and is of very large diameter to assist the engine to pull the vehicle slowly in traffic on top gear. The carburettor is a Solex automatic and the magneto a Bosch. With the aid of the large flywheel and automatic carburettor the engine speed can be as low as 100 r.p.m., which is an extremely slow speed for a single-cylinder engine that will run up to nearly 3,000, and shows itself with an outside flywheel of large diameter, very great flexibility can be secured even with a single-cylinder engine. The compression of the engine is comparatively low, which is, of course, correct for a voiturette of this type. The whole of the power unit is suspended at three points, the gear box ending at the rear in a run-in, which allows the whole frame to turn on it when it is subjected to shock. The friction cone clutch is a single disc clamped between two friction plates. The gears are all made of chrome nickel steel, and all running parts revolve on double ball bearings. The propeller-shaft drives from the gear box on to a back axle with the usual type of car bevel gear, only, of course, made very much smaller and lighter. The shaft runs in a tube, which acts as a torque tube as well as a tunnel for the shaft to run in. The back axle has no balance gear in the ordinary sense, it is constructed as follows: One rear

hub is keyed to the axle, and the other wheel is driven through the intermediary of a conical friction clutch which connects the axle and the hub, contact being kept at a constant pressure by means of a spring washer. The wheels are interchangeable and detachable, and a spare wheel is carried. The frame, which is made of channel steel, carries on it the starting handle which is fitted in front, the radiator for the thermo-syphon circulation, clutch pedal, accelerator pedal, rear wheel brake pedals, charge-speed hand lever, and brake hand lever. The last two are fitted inside the body.

In connection with the brakes, it might be argued, owing to the friction cone clutch arrangement in place of balance gear, that the braking action would not be effective. We are assured, however, that it prevents side-skidding. The springing is by means of four semi-elliptical springs, and the two-seated body is of torpedo shape, the driver's seat being set a little in front of the passenger's.

This vehicle is sold at an extremely moderate price, taking into consideration that it has a hood, screen, spare wheel, and electric lamps. These latter are fitted in neat recesses in the dash. The steering is not by worm, wheel, and sector, but by levers; the front wheels are inclined so that a line drawn through the steering centres strikes the ground slightly in front of the vertical line drawn through the wheel, so that any shock to the wheels is not directly transmitted to the steering wheel. The steering is, moreover, claimed to be irreversible.

The lubrication of the engine is by gravity from an oil tank in the dash. The petrol tank is also carried in the dash with the batteries for the electric lamps. The wheelbase is 7ft. 6in., and the track 3ft. 9in. The chassis weight is 4 cwt., 3 qrs. 7 lbs., and the total weight of the vehicle is only 5 cwt., 3 qrs. 16 lbs. It will, therefore, be seen that this is a true cyclecar. The control of the engine is by means of an accelerator pedal. There is no advance lever for the magneto; the lubrication is automatic; and one rod, which pushes in and out like the handle of a pump and protrudes from the dash, cuts off the petrol, oil, and ignition at one movement. All that is necessary is to push it in to shut off everything, and to pull it out to turn on everything ready for starting. The firm making this vehicle are engineers with a very fine equipment, and have been making parts for the trade for a considerable time.

### Baby Peugeot.

The Baby-Peugeot is a vehicle we have already described and illustrated, and it is safe to say that when the firm of Peugeot Frères, London, are in a position to give delivery there will be a run on this model of a bigger vehicle. The chief items of the specification are: Pressed steel frame, four-cylinder water-cooled engine ( $55 \times 90$  mm. = 886 c.c.), two speeds and reverse, propeller-shaft and balance-geared rear axle, 22in.  $\times$  2½in. wheels and tyres, irreversible steering, Truffault suspension, and two-seated torpedo-shaped body. The price is to be £160.

Another view of the two-speed shaft driven Baby-Peugeot. This vehicle has 22" wheels.

# The Ronteix Four-cylinder Runabout.

A French Cyclecar with Concentric Gear and minus a Differential.

**A**MONG the light runabouts which attract general attention, the Ronteix 6-8 h.p. four-cylinder has the merit of solving several mechanical problems in a particularly simple manner.

The vehicle is built for two or three people, and the engine being economical, the running expenses should be small. Both engine and chassis consist of a few strongly built parts that are easily interchangeable, the construction enabling the owner to effect repairs under the most inconvenient circumstances, as, for instance, where expert workmen are not to be found.

## Engine and Transmission.

The motor is a four-cylinder, cast *en bloc*, bore and stroke 60 x 80 mm., and rated at 6-8 h.p. The gear box is quite unique of its kind, as the transmission is obtained by a direct drive on all speeds, including the reverse. It acts in the following way: the transmission shaft

Neat design four-cylinder engine. Observe the valve casings.

carries a pinion which meshes at will with three concentric gears, and thus effects the change of speed as it is moved from one to the other.

The transmission acts through a chain only to one of the hind wheels, and there is no differential.

Another innovation in automobile practice is found in the suspension, both in front and rear. This suspension, which our pictures explain sufficiently, is very flexible and strong; it is specially suited for colonial use.

The steering column operates through an eccentric and a rod.

## Chassis details.

The chassis is made of pressed steel and has a total length of nearly 10ft.; the wheelbase is 8ft. 4in., and the track nearly 3ft. 6in. A leather cone clutch, thermo-syphon cooling, lubrication by forced feed, ignition by Nilmelior magneto, and automatic Claudel carburetter are other features. The tank contains

Plan of chassis, from which it will be seen that the drive is on one wheel only.

about four gallons of petrol, which is sufficient for a 125 mile ride.

Two brakes acting on the rear wheels by extensible segments are operated by a hand lever; a pedal works also in the same way on the shaft of the gear box; this pedal also controls the clutch.

Either wire or wood wheels can be supplied at the option of the purchaser.

The acceleration is effected by a hand lever fixed under the steering wheel and controls the carburetter.

Weight: two seats, 9 cwt.; three seats, 10 cwt. The whole vehicle strikes us as being strongly built and

likely to be very serviceable. Although slightly over the R.A.C. definition, could obviously be made lighter.

Special form of rear springing on the Ronteix.

Next week's issue will contain "THE MOTOR CYCLE" BUYERS' GUIDE. An annual feature.

Front springing of the Ronteix. Any one wheel can lift without affecting the others.

# We extend a cordial invitation

to all old and new friends of  
the "BAT" to make Stand  
No. 97 their rendezvous at  
OLYMPIA. While waiting  
you can pleasantly pass the  
time by inspecting the new  
models of this favourite motor  
cycle. That you will find  
plenty to interest we know from  
the many features exclusively  
embodied on these machines.

# MEET YOU AT 97

Book of the Bat  
sent free on request.

THE BAT MOTOR MFG. CO.,  
LONDON, S.E.

THE PULLMAN CAR OF MOTOR CYCLES.

Among other items are the—

**SPRING FRAME**, sprung fore *and*  
aft, making riding easy on the roughest  
roads,

**MAGNETO POSITION**, out of  
the wet, and unaffected by rain storms,

**FOOT STARTER**, enabling  
the machine to be started with  
both wheels on the ground,  
and the

**TWO-SPEED GEAR**,  
permitting the slowest pace  
on treacherous surfaces

*In answering this advertisement it is desirable to mention "The Motor Cycle."*

# GLORIA

## Sidecars.

### Dangerous Sidecar Attachments.

*A Correspondent in  
"Motor Cycling" writes:*

"I am looking round for a safe and properly constructed sidecar, but as far as I can see the only correct fittings on the market appear to be the Gloria double tube attachments, which embrace the top tube and backbone of the machine at the front and the seat stay and bottom stay at the rear."

The Gloria has a positively safe attachment, no other Sidecar like it, and it is most readily attached and detached.

Then again, the wheel is spring suspended, which allows it to rise and fall and so correct the irregularities of the road surface. However uneven the surface the passenger rides in perfect comfort.

There are several Models to choose from, each one beautifully appointed, and they will be on view on

**Stand 76,  
Olympia.**

*Be sure and see them before ordering your Passenger Outfit.*

**Gloria Cycle Co., Ltd., ————— Coventry.**

# QUESTIONS and REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Magneto Cut-out.

Some little time ago I fitted a magneto cut-out to my 2½ h.p. machine, and have used it for the purpose of retarding the engine, in preference to raising the exhaust valve. Am I correct in this, or has such use any ill-effect on the compression of the engine?—C.H.

There is no harm in using a magneto cut-out in preference to the exhaust valve, though it would cause the machine to stop and start more jerkily, owing to sudden acceleration when current is washed on.

## Overloading.

I have a 3½ h.p. two-speed machine and sidecar. After running about five miles the engine seems to tire and knock when on the high gear. How should the spark lever be advanced or retarded for ordinary riding on the level and on hills?—A.H.P.

The trouble seems to be overloading, which, of course, is due to the machine being too heavy on the high gear. The spark lever should be fully advanced, or nearly fully advanced, on the level, and if the engine shows signs of labouring on hills it should be slightly retarded. Perhaps after the engine has been running a little while it will improve.

## Licence and Registration.

A short time back I had a trial run on a motor cycle with a view to purchase, but, owing mainly to a defect in carburetter I had a collision with a car. This happened under the eye of a police constable. I was requested to produce my licence, which, although I had written for it, did not arrive until the next day. I then received a summons for failure to produce same, and also for riding an unregistered cycle, as the registration had been cancelled by the owner just previously. I was perfectly ignorant of the cancellation of the number.—HAN.

We should say that if you can prove that you had actually written for a licence, or had paid the fee, this part of the case would be dismissed. Also, you might plead ignorance that the registration of the machine had been cancelled. You might also point out that you were having a trial run, and it is quite possible that the bench may take a lenient view of your case.

## Old Number for a New Machine.

Last week I sold my motor cycle, which was registered at Sunderland, on the condition that I retained my registration number (BR 109) for my new machine.

I notified the Sunderland authorities of the sale and also that I wished to keep the old number for the new machine. I have received a letter from the chief constable of Sunderland to the effect that my action is irregular. Have I any ground to take exception to his demand for a further fee of 5s.? I am not keeping two motor cycles, but only one for which I have already paid the registration fee required.—PERPLEXED.

The chief constable is quite in order. In making your application for retaining the old number you should have asked him to cancel the registration of the former machine, and for permission to use the old number. There is no alternative to your paying the full registration fees again; this is the usual procedure. It is the machine, not yourself, which is registered, and the registration can be transferred to another owner for a fee of 1s., but it cannot be transferred to another machine, although, as a rule, the same numbers can be used. In the case of the Inland Revenue licence of £1, it is the owner who is licensed to keep one motor cycle, and so long as he keeps only one

at a time, it does not matter how often he changes his mount, but each new one must be registered at a charge of 5s.

## Air Lock in the Tank.

I have noticed on motor cycles, with or without automatic carburetter, the following fact: While riding under heavy rain the carburetter from time to time stops feeding the engine with mixture, this being a consequence of the float chamber being without the necessary petrol flow from tank. As soon as I open the petrol filler cap on tank the wanted petrol flow is re-established and engine fires again. I cannot understand why this only happens while raining heavily. What influence can the damp atmosphere have on the air pressure in the tank, and how is a remedy possible without opening the petrol filler cap on tank?—C.A.S.

Evidently what you are suffering from is an air lock in the tank. Wet, mud, or dust gets round the edges of the filler cap at the top and into the vent hole and hermetically seals it up so that the air cannot get into the tank. The remedy is to have an additional hole in the filler cap, so as to ensure an ample access of air to the interior of the tank, otherwise the atmospheric pressure in the pipe will prevent the petrol from flowing freely. Some firms fit a hub lubricator in the vent hole.

3½ h.p. three-speed single-cylinder Torpedo to be exhibited at Olympia. The Torpedo machines are made at Barton-on-Humber, by F. Hopper and Co.

## Adjustment of Contact Breaker.

Q

I have bought a second-hand Quadrant and I think the timing of it is wrong. The contact breaker, I think, is what is called make and break. Can you tell me how to adjust it?—J.W.B.

You should adjust the platinum screw, roughly, so that engine just fires; then set engine running with the machine jacked up; unscrew the platinum screw until the engine begins to misfire, then revolve it half a turn in the opposite direction and lock it. You will find hints on tuning engines in the latest edition of "Motor Cycles and How to Manage Them," which can be obtained from these offices.

## Liabilities of County Councils.

Q

I am writing you regarding an experience that befell my wife and myself lately. My wife being an invalid, I took advantage of the very fine afternoon to motor to South Cave. From there we decided to return *via* Ripplingham and Kirk Ella. All went well until coming down the hill from Ripplingham, when we suddenly ran on to a patch of stones thrown loosely all over the road, and I may add that before we pulled up we had run over several more patches, having no alternative, as they practically stretched the full width of the road. The result was that, though we managed to keep our seats, I had to repair a burst in my new tyre. This was not all, for after being delayed a considerable time (in the dark), I had then to push the combination fully half a mile, passenger included, to say nothing of having to walk in places on the loose granite. My reason for writing is to get to know if the East Riding Council (Beverley) are justified in leaving the main road in what I call a dangerous condition, for that is what it amounts to.—A.A.T.

Our legal adviser writes as follows: "I think it is possible that 'A.A.T.' would succeed in any action brought, but the circumstances of the case would have to be very carefully gone into, and he should consult a solicitor. The local authority is not liable for any damage caused by the non-repair of a road, but if damage is caused through the negligent way in which the repairs are carried out then the authority would be, unless there was contributory negligence on the part of the one injured. The fact that it is a common thing for local authorities to repair country roads by covering the surface with rough stones and leaving the same for some time might weigh with a judge or jury as to whether that was to be considered a negligence. On the other hand, it might be held that whether it was negligence or not, if the motor cyclist had a good light on, he ought not, in the dark, to have been going at such a speed as to be unable to get off when he saw that the state of the road would be likely to injure his tyres. A very interesting case was decided in 1909, where damages were claimed for the loss of a horse attached to a waggon. In a lane through which the waggon had to go the defendants were repairing the road, and for 130 feet five inches of granite stones had been laid down over the whole roadway. On part of it a steam roller had been at work, but part

of it had not been rolled at all. The driver was unable to get his horses along the part that was unrolled, and one of them fell down and died from a ruptured vessel. The waggon could not be turned round in the lane, and there was no warning notice at the commencement of the lane. It was alleged that the road had not been closed, that it should have been made up by halves, that the road should have been scarified, and that no warning notice had been put up. The jury held that there was negligence on the part of the council in the way they carried out the repairs, and that the driver could not, by taking reasonable care, have avoided the consequence of such negligence, and also that the death of the horse was the natural consequence of such negligence. This judgment was supported in the Court of Appeal, although one of the judges said that there was no evidence that the death of the horse was the natural consequence of the negligence. In another interesting case, decided only this year, a county council were engaged in repairing a road, and had employed a steam roller to roll down and level in new metal. The operations were confined to half the width of the road. A man driving in a donkey cart was going along the half left open, and was jerked from his seat by the wheel colliding with a large stone lying close to the grass margin. He was thrown under the wheels of the steam roller and received injuries from which he died. It was found that the stone had been there two or three days, and it was held that in repairing a road the county council must take care that the portion left open for public use should be reasonably fit and safe for user."

## How to Obtain Driving Licence.

Q

I should be obliged if you would inform me whether it is necessary to possess a motor cycle before getting a driving licence, as I anticipate having several opportunities of riding a friend's machine, not possessing one myself. Also please state the necessary procedure for obtaining same.—A.G.M.

Anyone over 14 years of age can obtain a driving licence; the ownership of a machine is not necessary. All you have to do is to apply to the offices of the nearest police authorities, whoever they are (any policeman will tell you), then fill up a form, and pay 5s.

## Registration of Tricar.

Q

I am in the possession of second-hand tricar, 4½ h.p. water cooled, coach built, one seat behind and basket seat in front. Weight is exactly 4 cwt. The local taxation authorities demand a registration fee of £1. Is this charge correct, should it be 5s., the same as motor cycle and sidecar? I feel sure there are some of the latter outfits heavy as the tricar I have, and registration fee of 5s. is asked for them. Are they not both tricars or tricycles as far as the Act goes?—J.M.R.

Yes, we are afraid you will have to pay a £1 registration fee, as the weight is over 3 cwt. The local taxation licence will be £1, as the machine is a tricycle.

## EXPERIENCES WANTED.

"E.B.L." (St. Helens).—1911 P. and with Senspray or Binks carburettor.

"T.D.Y." (York).—3½ h.p. Zenith Speed, power, tyres, belts, and flexible.

"L.P." (Roxburgh).—B. and B. Senspray (variable jet model) carburettor on 3½ h.p. Brampton variable gear.

"H.S." (Nottingham).—P. and M. water and without sidecar.

"O.G.P." (London).—Mabon variable gear with Triumph and sidecar.

"T.B.R." (Cleethorpes).—Clyno and sidecar. Reliability.

"E.W.F." (Slough).—Brampton gear.

"B.P." (Hampstead).—3½ h.p. Sco last quality.

"W.S." (Huddersfield).—8 h.p. water cooled Williamson. Reliability, hill-climbing, and petrol consumption.

"J.G.L." (Childs Hill).—6 or 8 h.p. Zenith, Matchless, or No. 7 Chater-I with sidecar, particularly as regards wear of tyres, belts, and chains.

"F.N." (Barnard Castle).—Best type for wear on 8 h.p. Chater-Lea sidecar 650×65 wheels; mileage.

"W.J.W." (Cardiff).—Four-cylinder F.N. and four-cylinder T.M.C. Special reliability, and consumption. Also two stroke Scott.

"Harrigan" (Cork).—5 h.p. A.J.S. hill climbing with sidecar, transmission and clutch.

"T.V.B." (Gateshead).—2½ F.N.; consumption, upkeep, wear of rear tyre, and reliability of bevel drive.

As evidence of the growing popularity of the Arden cyclecar, we reproduce the above, showing five complete vehicles awaiting delivery. The Arden has already been described in "The Motor Cycle."

## Show Features.

**N**EXT week's Cycle and Motor Cycle Show at Olympia will be more a motor cycle and less a pedal cycle show than ever. Practically every stand in the exhibition will have on it either motor bicycles, passenger motor cycles, or accessories appertaining to the motor cycle. During the past few weeks we have dealt with nearly every new make of motor cycle, practically all of which will be on view at Olympia, and this week, in addition to further new models, we repeat *The Motor Cycle* Buyers' Guide, which includes specifications and prices of all machines on the British market.

Reviewing the principal features of 1913 machines. Side by side valves are most popular in both singles and twins, and the overhead inlet valve, successful as it has been, is not gaining ground, *i.e.*, there is no sign of a rush on the part of reputable firms of long standing to change from the former to the latter design. Bore and stroke ratios are practically unaltered; the motor cycle engine in this respect differs greatly from car practice. In car engines it is common for the ratios of stroke to bore to be nearly two to one, whereas in motor cycle construction the stroke rarely exceeds the bore by more than five millimetres in single-cylinder engines of 500 c.c.; this is doubtless almost wholly due to lack of head room. In some twin-cylinder engines of small bore the ratio is 1.4 to 1, this being brought about by the division of the bore into two cylinders of small bore instead of one of larger dimensions, without decreasing the overall length of the engine. An article in the current issue of *The Autocar*, written by a practical designer of a most successful engine, shows that, even for the comparatively slower running motor car engine, a ratio of 1.3 to 1 produces an engine which is quicker in acceleration, more durable, and smoother in action than those which exceed the proportion named. It appears, therefore, that motor cycle engineers are on the correct lines. The two-stroke engine has not, despite its great success in this year's T.T. Race, been adopted by many manufacturers: two or three new models with two-stroke engines will be shown, but there is no sign of this principle becoming in any way general. This we regret because the two-stroke simplifies design to such an extent that it is possible to make a two-stroke engine with only three moving parts—crank, piston, and connecting rod.

There is a slight tendency, perhaps, to revert to detachable heads, which simplifies valve grinding and the removal of carbon deposits, but this again is not general, for by far the greater number have one-piece cylinders. Partly enclosing the valves and tappets is a noticeable tendency in the right direction; it makes for a cleaner and slightly quieter valve action, and if carried further the guides, etc., might work in oil, which would tend to reduce wear and absolutely exclude grit. Lubrication methods are receiving far more attention than previously, and many more engines will be exhibited this year with various forms of drip feed either entirely automatic or depending partly on the rider for replenishment of the pump barrel; forced lubrication has been adopted by several firms this year, whereas last year there were only two examples in the Show. The introduction of a special force feed apparatus for motor cycles by a leading firm may revolutionise motor cycle engine lubrication.

Nearly all motor cycle engines remain air-cooled, but examples of water cooling will be shown. The control of engines is little altered, the twin handle-bar control for the carburetter is almost universal, and few machines will be offered without a handle-bar-controlled magneto. The fittings for these in many notable instances are permanently attached, and where they are not the clips have been dispensed with and neater methods adopted.

Silencers will be inspected with more than usual interest this year in view of threatened legislation. The question of a quieter exhaust has been settled in most cases by the fitting of an expansion chamber and a rearward extending pipe which certainly reduces noise, particularly to the rider. The transmission question still remains a vexed one. All types have their advantages; direct drive by belt is still the most popular, followed by the all chain system. The compound type either by chain and belt or gear and belt is third in popularity from a manufacturing standpoint, and shaft drive comes last.

Frames are little changed, and we are surprised that more attention has not been given to springing; there are one or two notable efforts to improve in this direction, but the majority still adhere to a rigid rear frame. In regard to sidecars the passenger's convenience has been further studied, and it is now easier to obtain a sidecar giving all the comfort obtainable on a touring motor car than ever before.

Cyclecars were fully dealt with in our last issue.

**W**HEN I first became the possessor of a motor cycle, and had been initiated into the simpler problems connected with it, such as how to make an ancient crock whose maximum effective horsepower was .25 or thereabouts surmount a humpbacked canal bridge, I became desirous of penetrating further into the mysteries of the petrol engine. For instance, I used to ask why does an engine take more air when travelling fast than when travelling slow? The answer I usually received from my motor cycling friends was, "Oh, because when she's going fast she can fire a weaker mixture," and when I again asked "why," I was regarded as a duffer or an utter lunatic not to understand so simple a statement. Perhaps some of my brother motor cyclists have not yet discovered the reason, so I will attempt to explain. In a properly adjusted carburetter there is no flow of petrol through the jet when the machine is standing, but as soon as the piston begins to move there is a flow of air through the carburetter, due to the partial vacuum in the cylinder on the suction stroke. This vacuum causes not only air to flow but also petrol from the jet, and in this way the explosive mixture is formed. The vacuum in the carburetter increases with increase of piston velocity, and hence the flow of petrol also increases, there being a definite rate of petrol flow for each piston velocity. But the petrol flow is not related to the piston velocity by a "straight line formula," as the mathematicians would say. That is to

say, if the piston velocity be doubled the petrol flow is not doubled, but is increased in a still greater ratio, making the mixture too rich. Hence the experienced rider, as the speed increases, opens his extra air valve, which has the effect of reducing the air velocity, and hence the vacuum decreases and the petrol flow returns to its normal value.

#### Combustion Chamber Design.

Another point about which there is a good deal of misconception among motor cyclists is combustion chamber design. We are continually hearing the praises of the spherical chamber sung by the makers of this or the other machine, and every motor cyclist, even if he is only of the "potterer" type, knows that the combustion chamber which approaches the sphere most nearly in shape is the most efficient. Now, I am afraid that some bold bad advertiser, for reasons of his own, first created the idea that efficiency is what is wanted in a motor cycle engine. I think every practical motor cyclist will agree with me when I say that the average man, whether he favours the 90 lb. lightweight or the mighty 7-8 h.p. twin, would rather run ten miles less to the gallon and be able to tackle every hill he meets without fear of having to indulge in a furious spell of l.p.a. before he reaches the summit. What the motor cyclist wants is a large reserve of power, provided the machine is reasonable in other respects, such as weight, life of tyres and

A SUMMER TOUR MEMORY. Sunset on the Thames at Pangbourne.

**A Few Points Simply Explained.—**

belt, and so on. Now, a spherical combustion chamber may be economical as regards petrol, but I will endeavour to prove that it is not suited to hill-climbing.

Suppose we have two cylinders with equal piston displacements and compression ratios, but let one have a combustion chamber of spherical form and the other a very flat chamber, as is necessary when the valves are placed on opposite sides of the cylinder. Let us call the engine with the spherical chamber A and the other B. Now the combustion chamber of A has a certain volume and a certain superficial area, while B has an equal volume but a much greater area, and will, in consequence, be able to dissipate heat much faster than A. Let both machines tackle a long steep hill. In my opinion, at first A and B will pull fairly equally, A being more economical of petrol. Soon, however, owing to the smaller cooling surface, A will begin to get hot, and consequently the power will fall off owing to a smaller weight of gas being admitted on each suction stroke. To counteract this the rider will open the throttle and close the extra air, admitting a richer mixture, which, for a time, will increase the power, but will also tend to raise the temperature of the cylinder higher and higher until the increased friction and diminished charge weight pull the engine up. B, on the other hand, owing to the large surface available for cooling, will not over-heat so soon, though at each stroke a greater percentage of useful heat is lost when running at a low power; when overloaded this very loss of heat enables the engine to run cool much longer. Of course, by making a bigger engine with a spherical combustion chamber the hill could be climbed satisfactorily, but then, look at the disadvantages of a big engine—more weight, which of itself means increased petrol consumption and increased tyre bill, to say nothing of minor disadvantages such as increased difficulty of handling and starting.

**Scavenging.**

Some time ago we heard a good deal about scavenging the combustion chamber, and there were dozens of letters in the motor press, some of them by people who knew what they were talking about, and a great many by people who did not; and we have had suggestions made which their originators as a penance should be made to experiment with. The one thing that everybody seemed agreed on was that scavenging would increase the power of the cylinder, the idea being that a bigger weight of charge could be taken in on each suction stroke. Now, personally, I have grave doubts about this increase of power. The first objection that strikes one is the cooling problem. Unfortunately, our pistons and cylinders are mostly made of cast-iron, which expands when heated, and our lubricants are oils of various sorts (when they are not concoctions of soap), and hence we are limited as regards temperature. This means that we have to get rid of a certain amount of heat somehow; and, as it is, the cooling powers of motor bicycle cylinders are often pushed to their limits. Now, if we take in a bigger charge into these same cylinders, obviously a proportionately greater amount of heat has to be got rid of, so that there is a greater chance of overheating trouble, or at least the temperature of the cylinder will rise until the power falls to its original limits.

Then, again, there is another objection. To completely burn 1 lb. of petrol, approximately  $3\frac{1}{2}$  lbs. of air are required. This is a matter that can be determined with great accuracy in the laboratory. Now, the most efficient mixture for an engine has been determined experimentally to be about one part of petrol by weight to seven or eight of air, or about double the quantity of air required to consume the petrol; and a similar condition of affairs is found in gas engines, any increase in the proportion of gas resulting certainly in a slight temporary increase of power, but a very large increase in the amount of heat carried away by the cylinder walls. Now, this large amount of extra air must be only necessary as a diluent, and the inert exhaust gas remaining in the combustion space probably serves the same purpose. Obviously, therefore, if these exhaust gases are expelled, air, and not mixture, must be drawn in to take their place, leaving matters *in statu quo*. "Yes," says the enthusiast for scavenging, "but the hot exhaust gases will be replaced by cool air, which will tend to make the engine run cooler, and therefore give more power." Well, I am afraid the increase of power would be very small, and I have not yet seen a scavenging arrangement suitable for motor cycles that would not absorb it all.

MAGNETO.

**DISSOLVED ACETYLENE FOR MOTOR BICYCLES.**

THE accompanying photograph is the first to be published, showing how a D.A. cylinder may be carried on a motor bicycle. The method of fixing may be somewhat crude, but it is satisfactory enough until the Acetylene Illuminating Co., South Lambeth Road, S.E., devise some better method of

The dissolved acetylene outfit attached to a 2½ h.p. Douglas machine.

carrying it. Clearly seen in the illustration is a needle valve adjacent to the union, which is turned by a key supplied with the outfit, and resting on the saddle is the gauge designed to be screwed on to the union which allows the contents of the cylinder to be measured. The cylinder is filled with acetone, that is cupric chloride, a spongy substance which dissolves the acetylene in such a manner that it cannot possibly be ignited unless mixed with oxygen. The gas is perfectly free from impurities, and burns with a beautifully clear light. The capacity of the cylinder is six cubic feet, being sufficient gas to give light for about twenty-four hours.

## OCCASIONAL COMMENTS

BY  
"IXION"

### Compound Drive.

The more I see of advanced 1913 models the more interested I become in the possibilities of the compound drive by chain and belt. I do not base my interest on the chain driver's criticisms of the primary chain drive; the fore chain certainly gives more trouble than the rear chain on a complete chain drive, but it stands up wonderfully well on a combined chain-belt drive, in spite of the fact that a very light front chain is often employed. Possibly the excessive wear of the front item in an all-chain drive is par-

which has covered 7,500 miles during the summer; its cylinder was removed for the first time after 5,000 miles, and the amount of deposit was by no means excessive.

After 7,000 miles its light piston collapsed, and so the engine was compulsorily dismantled once more, but there was not sufficient deposit to have justified the labour of a clean-up.

I am well aware riders vary greatly—some are methodical, and others are casual in respect of lubrication. Riders who seldom scrap along on full throttle, and who are sufficiently methodical to keep a constant eye on their speedometers can probably drive an engine 2,000 miles with mere hand pump oiling before decarbonisation becomes essential. But such riders form a small minority, and in my opinion it is the duty of the trade to supply lubrication systems which will prevent a forgetful and speed-loving duffer from silting up his engine with charred filth every thousand miles.

I regard the drip-feed as a mere temporary makeshift, pending the adoption of some truly mechanical device, though the drip is a real advance on the hand pump. Nor am I greatly in love with such mechanical oilers as I have yet tested. My experiences with one device were not too encouraging, owing to shoddy workmanship. When the mechanical oiler was working, it spattered one entire side of the engine with oil, owing to faulty joint facings and packings, and it very frequently went on strike altogether.

Car manufacturers have solved this problem in a variety of quite satisfactory designs, and it is high time that motor cycle designers make a real advance. Many of the complaints one hears about short-lived bearings are due to a momentary forgetfulness on the owner's part working in conjunction with a primitive lubrication system. Ten to twelve years ago motor cycle engines were fitted with the same oiling system which on most machines remains standard to-day.

Tubular framework of the Gordon light car.

tially ascribable to inefficient slipping devices or to placing them in the wrong position, and to the fact that there is a certain amount of rigidity both ways, *i.e.*, when the rear wheel is driving the engine, as well as when the engine is driving the wheel (notice, for example, the strains in a futile effort to start, with a sudden pull-up against compression). With a combined belt and chain drive the snatch of the road wheel turning the engine is doubly eased—once by the belt and again by the slipping device. I base my interest in the compound drive on its superior gracefulness of aspect. A fully-encased chain drive creates an inelegant excrescence on a machine, no matter how neatly it is made, and this would be altogether avoided by using an encased shaft as the primary item of a combined drive, while the wear could be largely eliminated by the use of some of the recently invented high grade steels, and adjustable bearings would not be difficult to arrange.

The shaft drive could effect a greater gear reduction than is convenient with chains and sprockets, and as a consequence the diameter of the belt pulleys could be made more equal. I fancy this drive has greater possibilities than are yet realised, and I should not be surprised if it suddenly attained a great vogue. Unfortunately few people have any practical experience of it, but I commend it to the experimentalists, both for motor bicycles and cyclecars.

### Drip Oiling and Carbon Deposits.

It will be interesting to notice at Olympia how many machines of first-class make remain loyal to the hand pump oiler with its alternating periods of over-oiling, correct oiling, and under-oiling. I know a 1912  $3\frac{1}{2}$  h.p. single-cylinder machine fitted with a drip-oiler, cro

An example of the P.D.A. cyclecar, with Mr. H. C. Pickering at the wheel.

## FORECAST AND GUIDE TO OLYMPIA

### CHATER-LEA.

Chater-Lea, Ltd. (Stand 78).—In addition to the Chater-Lea cyclecar and No. 7 sidecar, particulars of which have already been published, the following will be exhibited by Messrs. Chater-Lea, Ltd. One item is an entirely new sidecar chassis called the Model B, specially constructed for low-built flat-bottomed canoe-shaped bodies. This has a dropped axle tube, and the supporting tube and springs are all specially designed. A quantity

with three-speed gear. The alterations to the  $4\frac{1}{2}$  h.p. sidecar model were detailed in the issue of November 7th. The lady's Singer is a  $2\frac{1}{2}$  h.p. machine, which has already enjoyed considerable popularity among lady riders, and a large number of orders have been booked for it for next year.

### Singer Cyclecar.

Four examples of the Singer cyclecar will be on view, and these, of course, will attract a great amount of attention. Two will be chassis enabling the whole of the mechanism to be easily inspected. The other two will be complete with bodies and full touring equipment. Singer and Co. have decided to call this machine "The little car with a lot of luxury."

To repeat one or two details of its specification the wheelbase is 7ft. 6in.; track, 3ft. 6in. The engine is a water-cooled four-cylinder of 63 mm. bore  $\times$  88 mm. stroke, the cylinders being cast in pairs. Lubrication is automatic and by pump to all main bearings and troughs. Three speeds and reverse are provided. The ignition is by Bosch magneto, and the carburetter is a Clandel-Hobson. One of these cyclecars fully equipped for trial purposes will be held at the disposal of interested visitors during the whole of the exhibition, and the makers will be delighted to give any prospective purchasers a trial run.

specification. The engine is an air-cooled twin-cylinder, 85 $\times$ 88 mm., with cylinders at 50°. The chassis is tubular and the wheels 26in.  $\times$  2 $\frac{1}{2}$ in. Transmission is by chains throughout, and the change-speed gear is on the counter-shaft midway between engine and rear axle. This cyclecar has a differentially geared back axle of substantial design. The wheelbase is 6ft., track 4ft., and the overall length 8ft. 6in. Screen and hood are optional.

The No. 7 Chater-Lea sidecar model has a band brake fitted to the rear hub.

of fittings for motor bicycle, sidecar, and cyclecar construction will be on view, such as worm-driven axles, gear boxes, belt and chain-driven hubs, etc. Chater-Lea, Ltd., have such an enormous variety of fittings that almost any design of motor cycle, cyclecar, or sidecar can be built from their standard parts. No less than five separate catalogues are issued dealing with various branches of the motor cycle industry. Any of these will be handed to enquirers at the stand.

### SINGER.

Singer and Co., Ltd. (Stands 79 and 79a).—Twelve Singers will be on view, varying in horse-power from  $2\frac{1}{2}$  to  $4\frac{1}{2}$ . Arranged in a prominent position will be the actual machine used by G. E. Stanley when he broke the hour record recently, also the 4 h.p. passenger machine on which Harry Long covered 20,000 miles this year. The  $3\frac{1}{2}$  h.p. Singer will be obtainable for 1913 in five models, i.e., fixed engine, free engine, two T.T. models, and with three-speed gear. The  $2\frac{1}{2}$  h.p. Singer will be supplied in six different variations of specification, viz., as a light roadster with fixed engine, free engine model, light roadster two-speed, two T.T. models, and

The simple timing gear mechanism of the 8 h.p. Chater-Lea engine. The inlet valves are operated by internal cams.

### PREMIER.

The Premier Cycle Co. (Stand 111).—Two models of the Premier cyclecar will be on exhibition. This machine we have already illustrated and described, but we repeat a few of the principal items in the

In examining the cyclecar the new models of the Premier motor bicycles must not be overlooked. They comprise  $3\frac{1}{2}$  and  $2\frac{1}{2}$  single-cylinder models with various specifications. To deal with the broad outline of the two types, the  $3\frac{1}{2}$  h.p. improvements include a dropped

The 1913  $4\frac{1}{2}$  h.p. model two-speed Singer. The engine has a bore and stroke of 89  $\times$  95 mm. and is specially designed for sidecar work.

will include chain drive and three-speed hub, but this machine will not be ready in time for exhibition.

### L.M.C.

The Lloyd Motor Engineering Co., Ltd. (Stand 88).—Advance particulars of the L.M.C. 1913 models have already appeared. Various models will be exhibited. Some will be fitted with the L.M.C. two-speed gear designed by Mr. W. J. Lloyd for the L.M.C. motor cycle. This gear has a combined belt and chain drive, the belt drive being direct from the engine pulley to the back wheel. This simple form of change speed should be examined by all who are interested in variable gears for motor cycles. Detail

1913 Chater-Lea No. 7 model with three-speed gear box, multiple-disc clutch, 8 h.p. engine and chain drive.

frame enabling cylinder to be removed without disturbing the engine. The tank will have rounded edges, a belt guard will be fitted, and also a spring-up rear stand, which is provisionally protected. The rear guard divides to facilitate tyre repairs.

The  $2\frac{1}{2}$  h.p. engine,  $66 \times 72$  mm., has an off-set cylinder, weighs about 100 lbs., and has only minor improvements over the 1912 design. Three-speed Armstrong gears are fitted to both types. The Premier Cycle Company will also put on the market for next year a 7.9 h.p. twin sidecar model, but it will not be ready in time for exhibition.

### TORPEDO.

F. Hopper and Co., Ltd. (Stand 82).—The firm of Hopper and Co., Ltd., make the Torpedo motor cycles. The models which will be on exhibition are the  $2\frac{1}{2}$ ,  $3\frac{1}{2}$ , and  $4\frac{1}{2}$  h.p. The first is a lightweight, weighing 105 lbs., the height to the top of the saddle being 29 in. A  $3\frac{1}{2}$  h.p. model will be shown with fixed or three-speed Armstrong gear. The frame of this model has been entirely redesigned, and the saddle position lowered

Low speed clutch and kick starter crank on the new L.M.C.

2 in. Belt shields will be fitted. The sidecar which will be fitted to the  $4\frac{1}{2}$  h.p. model is of an entirely new design. The chassis is built on the girder principle, and the hub is supported at both ends of the spindle. The sidecar wheel can be detached in a few

seconds, and when removed from the sidecar is held in position by a concealed stand. A luggage grid is provided. For next year the firm is preparing a  $1\frac{1}{2}$  h.p. Torpedo lightweight. The specification

$3\frac{1}{2}$  h.p. Torpedo engine, showing handle-bar controlled carburetor, adjustable footrests, and heel operated left rim brake.

Dunhill's new sidecar body with seat at side for child.

improvements to the L.M.C. comprise a half compression device, adjustable tappets, a new spring fork, new toolbag, and mudguards. The rear portion of the back guard is joined to the carrier, and so made that the guard and carrier can be swung round to give easy access to the tyre. Incidentally we may mention that roller bearings to the connecting rod which have been adopted by one or two manufacturers for next year have been employed in L.M.C. engines for five years.

One of the additions to the Triumph range. T.T. roadster with hub-plate clutch.

## LINCOLN ELK.

Among the Lincoln Elk machines to be exhibited by Mr. J. Kirby, on stand 121, is a new model with  $4\frac{1}{2}$  h.p. engine, bore and stroke  $89 \times 96$  mm. This machine has a double drive, a 1in. belt conveying the power on the high gear and a chain on the other side of the machine being utilised for the low gear. It has a dropped rear frame enabling a low saddle position, Druid forks, a front mudguard fitted with side extensions, and comfortable footboards. 26in.  $\times$  2 $\frac{1}{2}$ in. heavy tyres are fitted as standard, so that this model should be especially suitable for passenger work.

## 1913 TRUMP.

A wide range of models will be exhibited by Trump Motors, Stand 40, and will be fitted with nearly all the well-known models of J.A.P. engines. At the first glance it would appear that the machine has not been greatly altered,

2-speed Lincoln-Elk with chain and belt drive.

Belt-side of the  $3\frac{1}{2}$  h.p. 3-speed O.K. Touring model.

except that the standard finish is now in black, but, as a matter of fact, several improvements have been made which tend to increase the reliability and comfort of the machine. In describing these details, we may add that they will be found as standard on all models. The engines will be fitted with a combined decompressor

it sufficiently strong to withstand the strains imposed by sidecar work. The tank, which contains two gallons of petrol and a quart of oil, is supported from below and fitted with a rounded top and 2in. snap filler caps, while to its lower side are fixed a swivel priming cock

and a detachable petrol sump and filter. Sturmey-Archer three-speed hubs will be fitted to the 4 h.p. single and 3 h.p. twin, and Armstrong Mark VI. to the heavier models; the latter will also be fitted with mudguards which allow of 3in. tyres being fitted. The front guards are fitted with continuous side flaps, which pass through the forks without special fitting. A front wheel stand will be fitted, and the carrier, which has been somewhat improved, supports a pair of metal enclosed pannier bags. All types are fitted with a hand or kick starter fixed to the rear stays and connected to the hub by a short chain. A  $\frac{1}{2}$ in. belt rim will be standard, so that either 1in. or 3in. belts may be used, and the belt will be protected by a neat shield. The Amac five-jet carburettor will be fitted. A sidecar can be supplied specially to suit these machines, which has four points of attachment, and is fitted with a neat rubber-covered step for the use of the passenger.

## IVY.

S. A. Newman (Stand 16).—Ivy motor cycles to the number of seven and one separate Ivy sidecar. The Ivy models comprise machines from  $2\frac{1}{2}$  h.p. to  $4\frac{1}{2}$  h.p., the latter being a sidecar model. The  $2\frac{1}{2}$  h.p. lightweight will have a Brampton

Removable sump and strainer fitted to the 1913 Trump-Jap.

Design of the steering head on the new Trump-Jap.

and internal exhaust lift, another feature being adjustable tappets, while somewhat larger exhaust pipes will be used. The steering head is now cast in one piece and strengthened by a steel liner, which makes

1913 3 h.p. 3-speed Trump-Jap.

**Forecast and Guide to Olympia.**

variable gear, the 3½ touring model a B.S.A. two-speed gear, and the 4½ sidecar model a Sturmey-Archer three-speed gear. The lady's model will have a three-speed Sturmey-Archer gear. The Ivy sidecar has a coach-built body and a patented springing device. Dunlop tyres are fitted to all models, also Dunlop belts. The Swan sidecar, with specially constructed body, details and illustrations of which have already appeared, will be found on the Ivy stand. The Swan sidecar is made by the Midland Motor and Cycle Co. of Oxford.

**NEW IMPERIAL.**

A wide choice is offered to the prospective buyer by the New Imperial Cycle Company (Stand 67), who list models from a 2½ h.p. single to a 6 h.p. twin. J.A.P. engines will be fitted throughout, and can be obtained in nearly all their variations. The motor cycles are fitted out very completely, and are solidly constructed. All fittings which should be permanent are brazed to the frame and so avoid a number of clips and nuts. Both front and rear mudguards have wide side extensions, while the rear part of the back

New Imperial footrest which may be adjusted in any direction.

guard is detachable with the carrier to facilitate tyre repairs. Both front and rear wheel stands will be fitted. The clutch and brake pedals are mounted on separate legs, and the footrests are adjustable in any direction. The tank, which is supported from the bottom, is capable of holding two gallons of petrol and a quart of oil. The petrol tank is fitted with a clock dial gauge, and oil is supplied through a Best and Lloyd semi-automatic drip lubricator. Bosch magnetos and Amac carburettors are standard fittings, and the firm construct their own spring forks under Druid licence. They also construct sidecars for commercial purposes and passenger carrying, and all frames which are to carry any considerable weight have double wheel supports and a dropped frame to give a low riding position.

Valve side of the 2½ h.p. New Imperial.

**ELSWICK.**

Elswick Cycles and Manufacturing Co. (Stand 84).—Elswick motor cycles are made in various models and powers. The lightweight is a 2½ h.p. and the 3½ h.p.

The latest pattern two-speed shaft driven F.N., which has a silver grey finish, which colour greatly enhances the appearance of the machine.

the standard touring model. Both of these machines have the same specification so far as fittings are concerned. The 3½ h.p. has an 25×83 mm. engine, and

the principal novelty of it is a front hub with divided spindle for quick detachment. The petrol and oil capacities have both been enlarged and bayonet-jointed filler caps are fitted. Some models will be exhibited with three-speed gears and free engine hubs. The Elswick sidecar is a low-priced attachment well-designed and sprung, and can be recommended to those who cannot afford a more expensive sidecar. Another model will be shown called the Elswick model B sidecar. This is of an improved type and is provided with a special mudguard with side wings covering the entire upper half of the wheel. The cane body is torpedo shaped.

**SHERWIN AND LEO.**

The Sherwin and The Leo are two cyclecars which will be exhibited by the London Motor Coach Components. (The Leo was illustrated last week.) The engine of the Sherwin is a monobloc 8-10 h.p. twin-cylinder, lubricated by trough and splash, a constant level being maintained in the troughs by a plunger pump. Cooling is by thermo-syphon, and the cone clutch is of the ordinary leather-to-metal type. Three speeds and reverse are provided, and the final drive to the rear axle is by bevel. The frame is of pressed steel supported on underslung semi-elliptical springs in front. The Sankey detachable wheels carry 650×65 mm. tyres, and a special device is embodied with the artil-

lery wheel to enable it to be more readily detached. The steering is by crown wheel and bevel and the control of the engine by accelerator pedal.

Elevation and end drawings of the 8-10 h.p. Sherwin chassis.

## Plans of Olympia, showing Positions of Exhibitors.

## GLORIA.

Many improvements have been made to the Gloria sidecars (Stand 76), and the bodies have been enhanced in appearance. The spring wheel is used on all models, and, in addition to stands for the wheels and receptacles for small parcels, the luggage problem has been carefully considered. Grids may be obtained attached to the heelboard accommodating large size touring trunks, and provision is made for a two-gallon tin of petrol. A model which is sure to create great interest is the projectile illustrated and described in our issue of October 17th last. This sidecar is luxuriously fitted out with every requirement, and is finished in first-class style.

## MOTOSACOCHE.

Motosacoché, Ltd. (Stand 102).—The Motosacoché models will be the 2½ h.p. single-cylinder with variable gear, which remains unaltered for 1913, the 2 h.p. lady's model with variable speed gear, the 2½ h.p. twin with two-speed gear incorporating free engine, chain transmission, footboards, and starting handle, and the 3½ h.p. twin, which, in the main, resembles the 2½ h.p., and is suitable for sidecar

A handsome Gloria sidecar attachment for next year, embodying the patent spring wheel. There is a receptacle in the back for parcel, etc., also a luggage grid underneath.

An example of the latest T.T. Rudge Multi.

work. A 6-7 h.p. engine will also be on view. This engine we have previously dealt with; it will be supplied to manufacturers of sidecar machines and cyclecars.

## STAR.

The Star Cycle Co. (Stand 83).—The Star Cycle Co. were among the earliest manufacturers of motor cycles, but have not marketed these machines for some years. They will re-enter the industry at Olympia with a 4½ h.p. motor bicycle 89 × 103 mm. = 630 c.c. This has an offset cylinder with detachable head for which many advantages are claimed. A detachable head allows easier access for grinding in valves, cleaning piston top, etc., and the valves can be ground in the ordinary manner without removing head. It also allows a lower frame, as it is not necessary to provide such a large space between the bottom rail and the cylinder top.

The cylinder is held down to the crank case by eye bolts which can be swung

forward, allowing the cylinder to be easily withdrawn. The valves are 1½ in. diameter and the tappets rods are enclosed in an aluminium cover extending upwards round the valve pockets. The piston is made of malleable steel. The connecting rod is a steel forging with extra large gudgeon pin bearing. Ball bearings are fitted to the crankshaft. The cam wheels are cut from the solid, and the spindle runs on a ball bearing. A decompression device is provided for starting and slow running. This is contained in the timing gear case, and consists of a slipper lever rocker operated by a small cam, and is put in and out of action by a lever connected to the exhaust lifter on handle-bar.

The free engine clutch is mounted on the engine-shaft, and is of the cone type leather-faced. The three-speed gear box is of the sliding type, just like a car, the top gear being direct. The box is placed at the rear of the engine and bolted to a platform attached to the crank case. Both chain drives from the

A new model for 1913. 2½ h.p. New Hudson. bore and stroke 70 × 90 mm. The cylinder of this model is offset.

# 1913 REX-JAP 1913

***“The Proved Best Sidecar Machine.”***

**T**HERE is no doubt—1913 will be a Twin Cylinder year—it is now generally admitted that the Single Cylinder is not satisfactory for hard Sidecar work.

The REX-J.A.P. has been specially designed throughout for Sidecar use—fitted with the world-famous Twin Cylinder J.A.P. Engine—especially strengthened frame with brazed-on lugs, ensuring perfect alignment of Sidecar—powerful brakes—spring cantilever seat and spring forks—

exceptionally large tyres—pressure-fed automatic lubricator—and many other exclusive features.

For speed, power, and flexibility, the REX-J.A.P. cannot be surpassed, whilst it is an ideal machine for traffic riding. Most hills can be taken on top gear—this is an enormous saving in wear and tear to the machine, and greatly increases the pleasure of driving.

The two-speed gear is perfect, and absolutely foolproof. On top gear the drive is direct from the engine to the back wheel.

**C** May we post you Preliminary 1913 Catalogue, giving full details of the improvements embodied in the 1913 Models?

**C** AGENTS—We have some good districts still open—our proposition will interest you.

# The ROVER Co., Ltd.,

## COVENTRY.

Valve side of the new model Rex single-cylinder bicycle.

engine to gear box and gear box to rear wheel are on the same side, thus ensuring a direct pull. The standard gear ratios are 4, 6, and 9 to 1, but the gear can be varied by substituting a different cog from the gear box or sprocket of the road wheel. The gear in no way interferes with the removal of the back wheel. Control is by means of lever and quadrant fitted to the top tube of the frame. A kick starter is provided on the gear box shaft.

The loop frame is maintained, but the top tube is dropped so as to allow of a very low saddle position. Spring forks are fitted; though the model illustrated has S.I.A.M.T. forks, Druid forks will be fitted to order. The engine, with its ingenious detachable head, which carries the valves and valve tappets, remains unaltered, but the new exhaust pipe, which is 1½ in. internal diameter, is now brought through an eyelet in the down tube of the frame to a new aluminium silencer, fitted with a foot-operated cut-out. The silencer union also carries a bracket, through which the adjuster of the Bowden exhaust lifter passes. Aluminium footrests are fitted.

It will be noticed that the front mudguard is provided with side shields, and that similar shields are fitted to the lower half of the rear mudguard. This mudguard is halved, and the carrier is attached to it, so that three parts of the mudguard can be swung out of the way, allowing a large portion of the circumference of the tyre to be exposed. The carrier is strongly constructed, and suitable for carrying luggage. Both brakes are hand-operated, and are applied, one to the inside and the other to the outside of the belt rim. The tank has also

The fitting of the exhaust pipe used on the 2½ h.p. S.I.A.M.T. Note the method of attaching the silencer.

The lubrication of the engine is by means of oil fingers cast on the crank webs. The oil first enters these from the drip feed or force pump, centrifugal force carries it to the crank pin, then through the connecting rod to the gudgeon pin and cylinder walls. The magneto is a Bosch chain-driven from the engine-shaft, and the chain runs in an aluminium oil-tight case. The carburetter is of the multi-jet variable choke type. An illustration of the new Star machine was published last week (page 1302).

### S.I.A.M.T.

Radium S.I.A.M.T. Co. (Stand 23).—The interesting S.I.A.M.T. motor bicycle has been considerably improved, and has now been made thoroughly to conform to English ideas.

been improved in outward design. The finish of the engine is particularly good.

The Villiers two-speed hub can be fitted if desired. The Radium S.I.A.M.T. Co. are shortly introducing a 3½ h.p. twin, 58 × 68.8 mm. = 498 c.c. This machine has obtained several successes in open competition since its introduction into this country, and many more in Italy, its country of origin.

### GRANDEX.

Grandex Cycle Co. (Stand 107).—Among the items on this stand will be a front and rear springing device, the invention of Messrs. Southard, Southampton, the makers of the N.A.B. spring seat-pillar. The fork ends are supported on enclosed springs working in tubular guides. Ball bearings in a cage allow

The latest pattern N.A.B. seat-pillar to be clipped on to the saddle tube. It will be shown by the Grandex Co. at Olympia.

the moving portion to work easily. A U-tube encircles the front wheel, and to it a front brake is attached. The rear spring is similar, being bolted to the rear fork ends, one spring to each side, and are joined by a U tube encircling the rear wheel. This springing may be fitted

1913 model 2½ h.p. S.I.A.M.T. fitted with overhead valves.

An 8 h.p. three-speed Bat-Jap finished in French grey.

to any make of motor cycle. Another ingenious Southard idea which will also be exhibited by the Grandex Co. is an oscillating oil pump operated by the exhaust valve tappet of a motor cycle engine and working through a ratchet and pawl. The pump is of the plunger type, and is supported on a special bracket. Its function is to deliver a constant supply of oil to the crank chamber and to maintain a constant level therein. It can be adapted to almost any make of machine.

### BAT.

The Bat Motor Manufacturing Co., Ltd. (Stand 97).—The new Bat sidecar machine (8 h.p., 85 x 85 mm.) is a particularly pleasing model. In the main it resembles this year's machine, but the detail improvements fitted to the 1913 model are well worthy of consideration. In the first place the back wheel is now made readily detachable. The brake

Bat clutch pedal, which, when depressed to its fullest extent, operates the hand brake.

rods are now fastened by means of special clips. The old method of fixing these rods with a pin, washer, and split pin has been done away with. The pin running through the eyelet in the rod has a groove cut round the edge, into which fits a clip, keeping the rods securely fixed and yet rendering them instantly detachable. To remove the back wheel it is only necessary to undo the chain and loosen the nuts on the back spindle, when the whole of the wheel can be dropped clear of the frame, carrying with it the clutch and the whole of the brake mechanism, as is clearly shown in the accompanying illustration. It will be noticed that the back wheel drum carries two brakes, the internal expanding brake controlled from

the right hand side of the machine, and the external contracting brake controlled by the pedal on the right hand side of the machine, which also operates the clutch. The square nut on the spindle is for adjusting the clutch, and if turned brings the inclined planes which expand the clutch closer together. The design of clutch is unaltered, it is of the internal expanding type. The cover over the magento bevel drive is a neat aluminium casting. It will be noticed that the front mudguard has been considerably improved, and a front wheel stand is now fitted.

### Spring frame retained.

A fitting which adds to the comfort of the machine is the XL'All saddle, which is now a standard on this model. The well-known Bat spring frame remains as before. The kick-starter has been strengthened by the fitting of a larger chain. Particular care has been taken to protect the driving chains from mud. The front chain is also almost entirely enclosed, but the removal of a door or lid (shown in the accompanying sketch) allows of ready access to the chain.

The arrangement whereby the clutch pedal being depressed to its fullest

extent applies the external brake on the rear wheel is ingenious. The first of the sketches show how this is carried out. When it becomes necessary to shift the gear box to adjust the chains it is impossible to get the gear box out of line, as on the bed plate on which it rests there is a leather engaging with a groove at the bottom of the box, thus preserving perfect alignment. We consider the 8 h.p. Bat to be one of the finest sidecar machines on the market.

So far as bicycles are concerned, the Bat Motor Manufacturing Company are specialising on three models only, and have dropped the single cylinder type altogether. The 6 h.p. model, 76 x 85 mm., is of a semi-T.T. type but is thoroughly suitable for touring, and is intended to be used occasionally with a sidecar. It is fitted with a good carrier, there is a front wheel stand, ample mudguarding is provided, and the Armstrong three-speed gear is fitted. The lever controlling this is situated on the right-hand side of the tank, the coupling rod of the controlling mechanism passing at right angles through a tube running across the chain stays, thereby carrying the control to the left-hand side of the machine. The

Bat front chain guard, showing lid, which allows access to chain, a spring holding the lid in position.

magneto is carried in front of the engine in this model. The third model is the T.T. twin, 85 x 65 mm., fitted with overhead valves and J.A.P. carburetter. The particular model shown will have the exhaust pipes and silencer copper plated. All-Bat models are fitted with J.A.P. engines.

Valve side of the two-speed 8 h.p. spring frame Bat-Jap with chain drive.

**ALLDAYS & ONIONS PNEUMATIC ENGINEERING CO., LTD.,**  
Matchless Works, BIRMINGHAM, and 58. HOLBORN VIADUCT, LONDON, E.C.

## AN AMERICAN MODEL.

A machine which hails from the United States has just made its appearance in London. This is the  $3\frac{1}{2}$  h.p. Pope, handled by the Pope Motor Cycle Agency, 55, Banner Street, Golden Lane, E.C. It will be exhibited at the Olympia Motor Cycle Show. The engine is 84.5 x 89 mm., 499 c.c., and is built entirely at the Pope factory, U.S.A.

The cylinder is offset and the combustion head is separate from the cylinder. The valves are of the overhead type. The carburetter is the Schebler automatic, a popular vaporiser in the States. The tank, which is cylindrical with domed end, contains two gallons of petrol and two quarts of oil. A large silencer is situated underneath the bottom bracket. The transmission is by a flat, endless, waterproof belt  $1\frac{1}{2}$  in. wide, and both pulleys are covered with leather.

The free engine and belt-tightening device is ingenious. In the pulley is a plate clutch, which is operated by a long side lever; coupled up to it is a lever freeing the clutch, and attached to the main lever is a long spring, at the end of which a jockey pulley is situated. The action of pushing forward the combination lever is first to engage the clutch, when any further movement will press the jockey up against the belt and increase the tension thereon.

Wide mudguards are fitted. The spring of the front fork is a laminated flat spring. A coaster brake is fitted in the rear hub, but to conform with English ideas a belt rim brake and also footrests will be fitted. The wheels are 28 in. and 24 in. tyres are fitted. The standard gear ratio is 4.6 to 1. The magneto is a Ruthardt, and the control is by twisting handle grips, operating the throttle on one side and the spark and exhaust lifter on the other.

## SPRING FRAMES.

Edmund and Co. (Stand 103).—Three models of the above machine will be staged at the Show, two, fitted with a revolving two-speed countershaft gear and a 5-6 h.p. twin-cylinder for passenger work. The latter has a two-speed free engine hub. The Charles Edmund frame has been improved. The footboards of this machine work in unison with the saddle, thus ensuring lateral rigidity combined with a firm wheelbase. The springing also does not prevent the attachment of a sidecar.

## MONOPOLE.

A few days ago we inspected the first machine of a new make which is being manufactured by the Monopole Cycle and Carriage Co. (Stand 56) Olympia. The model we examined is fitted with a  $3\frac{1}{2}$  h.p. engine of 85 mm. bore x 88 mm. stroke, and is designed on standard lines throughout. Though

there is no outstanding feature which specially calls for attention, one finds on close inspection that all details have been carefully thought out, and that the machine is soundly built.

Gas is fed by a B. and B. straight-through type carburetter, and the charge is fired by a Bosch magneto, whilst the

$3\frac{1}{2}$  h.p. Pope to be exhibited at Olympia.

transmission is by belt to a Sturmey-Archer three-speed hub gear. The frame has a dropped top tube, and is of very stout construction, the back stays being particularly noticeable. Handle-bar control is fitted throughout, the levers

Bowden combination control levers on the new Monopole.

being of the Bowden combination type, in which only one clip is used for the carburetter and brake control, etc. The tank has rounded edges, and is fitted with a glass petrol gauge and a Best and

Lloyd semi-automatic drip-feed lubricator. Specially thick front-wheel spindles are fitted, and the rider is protected from mud by large side flaps running the whole length of the front guards; the rear guard is extra wide, and provided with an additional guard over the belt. We especially noticed that all jaw connections on brake rods, etc., are accurately machined from the solid, and not merely filed-up castings. The footrests consist of good rubber covers let into the strong aluminium plates, which provide side pieces to prevent the foot slipping off. The clutch and brake pedals are mounted on separate rods, and care has been taken to set them in convenient positions.

Monopole rear fork end.

Enfield magneto drive and kick starter.

- A. Cap covering magneto armature spindle.
- BB. Adjustable ball bearings.
- C. Crank of kick starter.

A  $2\frac{1}{2}$  h.p. model of 70 mm. bore x 76 mm. stroke will also be marketed. It will be constructed on much the same lines as the  $3\frac{1}{2}$  h.p.

R. G. Nye and Co. (Stand 118).—This firm will stage Stuart-Turner motor bicycle, which we illustrated on November 14th. They also hope to have the Gyroscopic engine, made by the Gyroscopic Engine Co., of Cardiff, and one or two other makes of motor cycles.

The 1913 Edmund spring-frame motor cycle, which is fitted with a twin engine.

## EXCELSIOR.

Somewhat of a novelty will be shown at Olympia by Bayliss, Thomas, and Co., the makers of the Excelsior (Stand 98). It consists of a single-cylinder engine of 96 mm. bore x 112 mm. stroke, and rated at 5.6 h.p. This engine is manufactured for heavy sidecar work as it is realised

Excelsior timing gear and decompressor.

that, though many people require extra power, they are afraid of the slight extra complication of a twin. In general lines the 5.6 h.p. resembles the the 4½ h.p. model, but extra cooling ribs are set diagonally across the cylinder head. A novel feature which is to be adopted on all Excelsior models is the combined decompressor and exhaust lift, the working of which is as follows, and can be followed from the accompanying sketch. The valves are operated by a single cam through the medium of rockers, and in front of the camshaft lies a third gear wheel running at engine speed. On this is mounted the decompressor cam, which also acts through a rocker. Above this rocker is mounted a tappet carried in a steel guide and pivoted to the crank case.

6 h.p. single-cylinder Excelsior, built especially for passenger work.

This guide may be swung round its pivot by means of a Bowden control. In the normal or running position the tappet is swung right out of action, but when it is desired to use the decompressor it is

Sidecar chassis of the 1913 model Rex-Jap with four point suspension.

moved to the position shown in the sketch. Thus, on the compression stroke, the auxiliary cam comes into action, and through its tappet raises the main exhaust rocker, thus allowing a certain amount of the compressed gas to escape. To lift the exhaust valve the tappet guide is forced further round and a toe formed with it comes into action on the exhaust rocker, keeping it raised till the lever is released.

Neat magneto fixing on Excelsior.

The magneto fixing is unusually neat and simple, as it is carried on a bracket which is clamped to the engine plates by two set pins. The silencer dimensions have been increased, and it now has treble the previous capacity; some of the gases are allowed to escape through the silencer end plate and some through a drilled pipe.

The machine is built throughout on standard lines, the frame being very powerfully made to withstand the strains of the big engine and sidecar. It is well mudguarded and may be fitted with either the G. and H. bottom bracket two-speed gear with chain drive, or Armstrong three-speed with belt drive. The Sturmey-Archer hub is fitted to the smaller models.

## REX-JAP.

The control of the Rex-Jap is very simple, and it is not necessary to take the hands off the handlebars. The machine can be driven at a crawl on low gear, and on high gear with a passenger and sidecar can attain considerable speed.

In order to prevent their clients having trouble with the tyres, the firm have made extensive road tests with various makes, and have finally decided to fit a 650 x 60 Kempshall heavy non-skid tyre on the back wheel and a 26 x 2½ Kempshall tyre on the front wheel. These tyres will be specially made with an extended flap, so that the tube is completely protected, and they are guaranteed, when used for sidecar work, for at least 2,500 miles.

H. Taylor and Co. (Stand 128).—This firm of agents will exhibit A.J.S. motor cycles, for which they are sole London and district agents; also Douglas, Rudge, and Zenith machines will be on view. Another exhibit will be the Super cyclecar tandem, an illustrated description of which has already been published in *The Motor Cycle*. It has an Anzani engine, 8-10 h.p., water-cooled, wheel steering, and combined chain and belt drive. A range of accessories will also be exhibited.

Triumph adjustable footrests, and new design brake pedal. The operating rod passes behind the pulley.

## AUTOWHEEL.

International Auto Wheel Co., Ltd. (Stand 126).—The new Autowheel has undergone several improvements. The chassis portion consists of a rectangular frame supporting the engine, over which a circular tube runs, the ends of which are brazed to the frame. To this the

Large timing wheel, camshaft with double cam, and chain wheel, showing castellated shaft.

mudguard is bolted, and brazed to the latter is a special cradle which carries the petrol tank, while the mudguard is attached by brass nuts so as to avoid rust. As regards size, the engine remains the same, though the new cylinder has larger radiating fins.

An examination of the parts of which the engine is composed shows that great care is exercised in its manufacture. The timing gear wheels are carried on castellated shafts, while the crank and camshafts are dropped forgings of Ubas steel. The small pinion of the distribution gear is formed in one with a sleeve which is a dead fit on the end of the crankshaft. Keyways are cut on the crankshaft in

Exhaust lifter of the Autowheel.

the sleeve and in the flywheel, and two keys secure the whole, while a castellated nut on the end of the crankshaft locks the whole together.

To stop oil from leaking from the crankshaft bearing, a felt washer is inserted, which is ingeniously kept in position by a split ring of steel wire, the two ends of which are bent up at right angles and engage with two holes in the minimum boss of the crank case. The exhaust lifting arrangement consists of two sleeves, on each of which an arm forms an integral part on which inclined

Crankshaft, small timing wheel and flywheel on the Autowheel engine, showing method of fixing.

Latest model of the Autowheel.

planes are cut. These slip over the exhaust valve tappet guide and form a simple and effective method of raising the valve.

As will be remembered from our previous description of the Autowheel, the crank case casting comprises the crank

the correct timing of the valves being brought about by two cams on the wheel instead of one. There is no doubt that great care is exercised in the design and manufacture of the Autowheel, and we cannot but congratulate the makers thereon.

## T.M.C.

Wilkinson T.M.C. Co., Ltd. (Stand 22).—This firm inform us that they were unable to obtain as large a space as they expected at Olympia, but they will be pleased to give the fullest information at the above stand, where they will be exhibiting a lightweight, a T.M.C. sidecar, and a cyclecar.

## THE COMFY SIDECAR.

The Comfy Sidecar Co. (Stand 114).—Eight sidecar models. The new design of frame enables the body to be slung several inches lower than previously, and reinforces the main axle. Four inch mudguards are fitted, supported by three solid steel stays. The hubs have extra strong axles; plated rims are used, and these, together with twelve gauge spokes, make a very sturdy wheel. Michelin tyres (26×2½ in.) are fitted as standard. The aprons are made of Cape cart hood material and fastened with six tabs. The bodies of all models, excepting the lowest

Front half of T.M.C. cyclecar chassis.

case proper, a lubricating oil reservoir, and a bed plate for the magneto (the firing point of which, by the way, is fixed). The lubrication works on the bird fountain principle. The reservoir is airtight, and the only means of reaching it is through a pipe which is normally covered with oil in the crank chamber. When the oil is below the level of the orifice of this pipe air passes up it into the reservoir and allows the oil to flow into the crank chamber. The flow into the crank chamber is controllable by means of a needle valve operated by a screw adjustment underneath the crank case. The lubrication, therefore, is automatic.

The camshaft, it may be remembered, is geared down 1 to 4 from the engine,

priced ones, are of solid reed cane with rolled edges, and are upholstered in leather cloth. A telescopic stand is fitted adjacent to the sidecar wheel, and all connecting tubes are telescopic, enabling the Comfy sidecar to be fitted to any make of motor bicycle. The policy of this firm is "No Extras," prices include apron, stand, etc.

An example of the Comfy sidecar.

Two imposing examples of Bramble sidecar bodies to be exhibited at Olympia. Stand No. 41.

### LAKE & ELLIOT.

Lake and Elliot (Stand 190).—One of the earliest firms to take up the manufacture of a two-speed gear for motor cycles was Messrs. Lake and Elliot, Braintree. The 1913 pattern has been improved in several details. The expanding brake, which is of phosphor bronze, has now two grooves cut round its circumference which allow the oil to be got rid of more quickly during engagement, while the wedge expander has had the angle on one side slightly altered, together with the corresponding edge of the brake or clutch against which it abuts, so that the drive is taken up with greater certainty. Both these alterations tend to allow the drive to be taken up more quickly and to obviate any possibility of slip.

### DAY & SONS.

Job Day and Sons (Stand 95).—In addition to the cyclecar described last week, page 1301, this Leeds firm will exhibit a  $3\frac{1}{2}$  h.p. motor bicycle. An overhead inlet valve is fitted, and a special feature is the system of lubrication. The lubricator discharges into a well at the base of the cylinder into which the piston dips at every downward stroke. One pint of oil has been found sufficient for 250 miles under normal conditions. An easy starting device which is fitted to these engines enables the engine to run under its own power and propel the machine at a speed as low as  $2\frac{1}{2}$  m.p.h.

New Cowey speed indicator with trip recorder on periphery of dial.

D10

### STELLA.

"Stella" is the name chosen by Messrs. R. G. Nye and Co. for the new two-stroke water-cooled machine manufactured by Messrs. Stuart Turner and Co., for which Messrs. Nye and Co. are the selling agents. We were given a short run on the machine, to which a sidecar was attached, the other evening. It proved itself to be easily controllable in traffic and capable of a good turn of speed. The engine runs extremely smoothly, the clutch takes up the drive very sweetly, and altogether the machine appears to be highly suitable for sidecar work.

### WINCYCLE.

Yet another folding sidecar has been introduced by the Wincycle Trading Co., Ltd (Stand 20).—Briefly described, the chassis consists of a rectangular frame composed of two longitudinal tubes connected by two pairs of cross stays pivoted at their ends to the former. The C springs, which are of the usual type, are secured together by transverse rods on which the body is fixed.

Two strengthening bars are secured between the springs, and are spaced a short distance from the frame. The ends of these bars are adapted to slide into slotted brackets brazed on to the cross stays, and are locked thereon by means of spring catches. Two attaching arms are arranged on the side of the frame nearest the cycle, one being attached to the diagonal tube of the machine near the rear forks and the second to the saddle pin. To detach the sidecar it is only necessary to undo two bolts at the forward end of the rectangular frame. This allows the body to be withdrawn, and also permits the frame to be folded up against the motor cycle. In the illustration of the chassis is shown a luggage carrier. This telescopes into the main longitudinal members of the frame, and is an additional means of keeping the whole rigid. It also serves to secure the frame if the chassis is used without a body. There are two stays underneath the springs, thus serving to keep the body rigid under normal conditions. The whole device is simple and looks as if it is likely to be a successful job. The sidecar has, we understand, been thoroughly tested. The fixings to the motor cycle frame are of the quickly detachable type, and it is interesting to note that the sidecar when folded will pass through a 2ft. 6in. doorway. The Wincycle Trading Co. will

Service Co.'s spring footrest. (Stand No. 20.)

also exhibit a  $3\frac{1}{2}$  h.p. Win-Precision motor bicycle, a  $3\frac{1}{2}$  h.p. T.T. models, a  $4\frac{1}{2}$  h.p. with Roc two-speed gear, and a  $2\frac{1}{2}$  h.p. Both the  $2\frac{1}{2}$  h.p. and the  $3\frac{1}{2}$  h.p. will be fitted with the top tube dropped at the rear.

The folding sidecar to be exhibited by the Wincycle Trading Co.

### STURMEY-ARCHER GEARS.

Sturmey-Archer Gears, Ltd. (Stand 143).—The Sturmey-Archer hub gear remains practically the same. Among other firms who will fit the Sturmey-Archer three-speed gear in 1913 are the Triumph and the Humber. A special plant of the latest automatic machinery, which has cost over £10,000, has just been installed, and the producing capacity of the firm is now 20,000 hub gears per annum. The makers recommend that in fitting this hub precautions should be taken to secure the axle and left-hand cone from turning, and that an anchor plate should always be fitted in the same way as on pedal cycle coaster hubs. Sturmey-Archer Gears, Ltd., claim that the only thing necessary for the perfect working of this gear is correct fitting.

## THE NEW PERRY.

An Up-to-date Cyclecar, with Twin-cylinder Engine, Three Speeds, and Worm Drive.

A WELL-DESIGNED runabout has been produced and will be on view at Olympia on the stand of Perry and Co., Ltd., Tyseley, Birmingham, the well-known chain makers. This machine has been undergoing tests for a considerable period, and is not in any way an untried vehicle. We ourselves had a run on one some six weeks or more ago. In spite of its car-like lines and general appearance, the machine is a true cyclecar, as the chassis is said to weigh only  $4\frac{1}{2}$  cwts. and the complete machine well under 7 cwts. The engine is of the two-cylinder vertical type, with both connecting rods working on a single crank pin, both pistons rise and fall together, and the explosions occur alternately. The cylinders, which measure  $72 \times 108$  mm., are water-cooled, and have the exhaust and inlet leads cast in them. The valves lie all on the near side, and are enclosed by a quickly detachable cover. Adjustable tappets are used, and a ball takes the cam-thrust. The magneto is driven direct from the front end of this shaft. Gas is supplied by a very simple form of automatic carburettor manufactured by the company. The motion of the single barrel opens the throttle and air ports in the correct proportions.

### The Unit System Adopted.

The gear box provides three speeds and reverse with a direct drive on top, and is bolted to the crank case so as to form a complete unit. The clutch is of the cone type, two metal faces working in a bath of oil being engaged by a powerful spring. Both clutch and gears are easily accessible by simply removing a long sloping cover. From the gear box, power is transmitted to the rear axle by a long propeller-shaft, which has a simple but effective T universal joint at each end. The rear axle is of the live type, driven by a carefully designed overhead worm. The central casting is of malleable iron, while the side members are tubular steel. A spur differential is fitted.

Details of the automatic carburettor.

The springing has received special attention, and the machine is carried throughout on long semi-elliptic springs, the rear pair being assisted by auxiliary coil springs. As will be noted from the plan view, the channel steel frame is narrow, thus providing a wide steering lock, and is upswept over the rear axle. The

The twin-cylinder vertical water-cooled engine and gear box unit.

cross-members are all tubular. A neat honeycomb radiator of pleasing shape is placed at the front of the chassis, and cooling is carried out on the thermosiphon principle. The steering corrections are on the usual Ackerman system, but the steering is direct—

Method of springing the rear of frame.

that is to say, no gearing is used. This system has proved perfectly satisfactory, and has the advantage of being very simple.

### Two Internal Expanding Brakes.

Both foot and hand brakes are of the internal expanding type, and operate side by side in drums on the rear wheels. The rear axle casing has an accessible oil filler placed at such a height that it is impossible to overfill the box.

Both petrol and oil tanks are neatly concealed in the dashboard, and the lubrication is by gravity drip

**The New Perry —**

feed to the crank case, whence it is splashed to all bearings. Sankey detachable steel wheels are fitted throughout and shod with 700 x 80 mm. tyres. Our run in the experimental machine convinced us of its smoothness and flexibility, and the machine was quiet and capable of surmounting quite fair hills on top speed. Altogether we were very favourably impressed with the new Perry.

Some of our readers may recognise the above as a description of the vehicle illustrated in our last issue which at the time had to be nameless. The wheelbase

of this little vehicle has been fixed at 7ft. 6in., and the track at 3ft. 7 3/4 in.

Worm drive and universal joint on Perry.

**NEW MECHANICAL LUBRICATOR.**

Now that mechanical lubrication is engaging the serious attention of motor cycle manufacturers, the fact that the Bosch Magneto Co. have brought out a pressure fed lubrication system for motor cycles is an item of extreme

**BOSCH FORCED FEED LUBRICATOR.**

- A. Union to connect pipe to oil reservoir.
- C. Central spindle which can be driven in either direction.
- B. Cam or helical disc operating pump plungers.
- D.D. Pump plungers.
- E.E. Leads from pumps to engine.
- K. Transmission shaft.
- M. Adjusting screw for regulating feed of pumps.

interest. The Bosch device consists of a cylindrical metal casing, the top of which is easily detachable, containing a series of six plunger pumps, each provided with an outlet conveying the oil to any desired portion of the machine. Oil enters at the union A from the main tank, and the central spindle C is worm-driven off the shaft K. As it turns it carries with it the cam B, which in turn operates the plungers D.D. of the pumps (two only are shown in the section). These pumps, by means of the plungers D, force the oil through the various exits E. The whole mechanism, of course, runs in oil, has no springs, and there is nothing to get out of order. Although considerable pressure is exercised, we understand that there is no danger of the pipes bursting. The lubricator may be driven in either direction. It will be noticed that the length of throw of each pump can be altered by means of the adjusting screw M.

The Bosch Co. have a N.S.U. motor bicycle at their works on which the experiments have been conducted, and it may be taken for granted that these have proved satisfactory, otherwise the device would not have been marketed. No suggestions have been made so far as to the position the pump should occupy, but it is so compact that it might easily be placed in front of the crank case when the magneto is behind, and *vice versa*. The method of transmission from the engine is the same as a magneto drive. The power absorbed to drive the pump is not stated, but in the case of medium-powered motor cycle engines any disadvantage in this direction should certainly be outweighed by the superior lubrication.

**THE BADCOCK BY-PASS.**

Mr. F. Badcock, 110, Woodville Road, Thornton Heath, has lately invented a by-pass for motor cycle carburetters. It is clearly obvious, (1) that if the relative size of jet and choke tube are suitable for all-round purposes there is so little air passing round the jet, relative to the size of the choke tube, at slow speeds that insufficient petrol is drawn through; (2) that when the throttle is in the nearly closed position there is a considerable vacuum in the inlet pipe and ports, which will draw a quantity of air through the valve guides and any leaky joints in inlet pipe without drawing in any corresponding amount of petrol.

In the case of the by-pass we are describing, advantage is taken of the vacuum to draw a small quantity of air through a minute choke tube of special construction, which causes a very strong mixture. The quantity necessary to counteract the defects mentioned is regulated by a self-locking thumb-screw, which can be adjusted while travelling. This is shown in the illustration. Once adjusted the action is automatic, for as the throttle is opened and there is an increased rush of air past the jet, so there is a decrease of vacuum in the inlet pipe, causing less of the strong mixture to be drawn through the by-pass. This balancing action makes the carburetter entirely automatic for slow and moderate speeds, especially if a larger choke tube be fitted, and the extra air will only be wanted when a high speed is obtained. The illustration shows the by-pass attached to the float chamber of an ordinary carburetter. Petrol flows into it through the hole A, which is so fixed that the level of the petrol is just below the jet. The pipe D conveys the mixture to the inlet pipe above the throttle, and the pipe E collects the hot air from the radiating fins near the exhaust valve. A spring not shown renders the adjusting screw self-locking. The device can be easily fitted and is inexpensive; it thus provides a means of converting a carburetter of ordinary type into an automatic one, at least at slow speeds.

**BADCOCK BY-PASS CARBURETTER.**

- A. Hole into float chamber.
- B. Spray hole.
- C. Special shaped spraying chamber.
- D. Mixture pipe leading to inlet pipe.
- E. Pipe collecting hot air.
- F. Self-locking regulating screw.

# One, Two, and Four Cylinders.

1913 model Tourist Trophy Rover.

An entirely new Matchless. This model is a 3 h.p. twin. It has a new type J.A.P. engine with overhead inlet valves, chain and belt drive and Armstrong hub gear.

Valve side of the 1913 model four-cylinder shaft-driven F.N. showing two-speed gear and the new type of operating lever

## MOTO-REVE.

We recently inspected the new model Moto-Réves in the company's new works near Wembley. Quite a new model will be the 4 h.p. twin 63 x 80 mm., provided with overhead valves. It is chain-driven, and provided with a two-speed gear of the internal expanding clutch type. The mudguarding is excellent, while Druid forks, a pan saddle, and comfortable footrests are provided.

Belt rim on Moto-Réve two-speed gear, showing adjustable spokes for truing up rim.

The 3 h.p. twin is a somewhat similar engine, but the machine which it propels possesses a light and efficient two-speed epicyclic hub gear manufactured at the Moto-Réve works. This hub only adds 5 lbs. to the total weight of the machine. The belt rim is attached to the wheel by spokes, which permit of it being easily trued up. This engine has a bore and stroke of 53 x 77 mm.

In addition, the company will be selling a 2½ h.p. single, 67 x 85 mm., and the 2 h.p., a genuine lightweight, 62 x 85 mm., fitted with two-speed gear, which is an inexpensive model, and should be good value.

Footboards fitted to 3 h.p. Moto-Réve.

All the machines have loop frames except the 2½ h.p., and all are provided with overhead valves except the 2 h.p. They will be exhibited on Stand 117.

The lubrication of the 4 h.p. models is by the Rotherham pressure drip feed lubricator. The Moto-Réve engines are splendid pieces of workmanship, and are well finished. Particular attention is paid to the carrying of tools and spares, and spacious bags fitted to the top tube are supplied with each machine.

## J.A.P.

The following new type J.A.P. engines (J. A. Prestwich and Co., Tottenham) will be on exhibition at Olympia: 4 h.p. side by side valve and overhead inlet valve engines with enclosed exhaust lifter; 4½ h.p. side valve, 90 x 93 mm. engine, also with enclosed lifter and heavy flywheels; the 70 x 64½ mm. twin side valve engine; and the 70 x 76 mm. side valve twin, fitted with heavy flywheels. All the above engines will have force feed lubrication.

1913 model of the 3½ h.p. tw.n-cylinder Motosacoche.

## MOTOSACOCHE.

On Monday last we were privileged to see the first 1913 3½ h.p. Motosacoche to be completed. Outwardly it strongly resembles the 2½ h.p. model. The engine is a beautiful piece of work and excellently finished. The dimensions are 64×77

Method of carrying oil and paraffin cans on Motosacoche.

mm., 496 c.c. The tank holds 1½ gallons of petrol and three pints of lubricating oil. As in the 2½ h.p. model the accompanying sketch shows that the usual compression taps are placed half-way down the cylinder, and when the paraffin or petrol is injected, it reaches the pistons and frees the ring, and none of it is deposited on the combustion head to be rapidly burnt away and deposit carbon. The valve tappet guides are screwed into an extension of the plate forming that part of the cylinder casting, which is bolted to the crank case so that nothing is screwed into the aluminium. Both the 3½ h.p. and the 2½ h.p. are provided with excellent mudguards fitted with efficient side shields. The transmission is by chains, the gear change being effected by means of internal expanding rings inside the sprocket. A friction device is provided on the main shaft, and there is a rubber buffer type shock absorber in the rear hub, with the result that the chain drive is practically as smooth as a belt. The magneto is placed behind the crank case and is accessible, well-protected, and easily dismounted. Either an Amac or Dufaix carburetter is fitted at the option of the purchaser. Hutchinson tyres are standard. The gears are 5½ and 8 to 1 on the 2½ h.p. machine.

### A 6 h.p. Motosacoche.

In addition to the 2½ h.p., the successful single-cylinder lightweight model, which remains unaltered, will be shown, and the 6 h.p. engine, which is a genuine novelty. This engine is 72×90 mm., 742

c.c., intended specially for sidecar and cyclecar work. It has enclosed valves which are of the overhead type, the case communicating with the crank case, for the purpose of lubrication. The oil is drawn up from the crank case by suction lubricates the rockers on the way, and returns to the crank case.

The splendid work put into the Motosacoche engines should be closely noted. Mr. de Lissa informs us that his patent valve was recently tested at the Motosacoche works in Geneva. The engine on which it was tested gave an extra ½ h.p. for four hours, and at the end of the period was so cool that it would not ignite a wax match.

## BARIMAR CYCLECARS.

The Parent cyclecar illustrated and described in the last issue, page 1319, will in future be known as the Barimar cyclecar, and will be handled in this country by Barimar, Ltd., 10, Poland Street, W.

### FEATURES OF THE NEW MOTOSACOCHE.

The 1913 3½ h.p. Motosacoche, showing position of injection tap and exhaust lifter mechanism, which allows the front valve to be lifted before the rear, if desired, by means of the adjustment screw at A.

Chain side of the new 496 c.c. twin-cylinder Motosacoche.

## B.S.A. 1913 MODELS.

New design engine with off-set cylinder. Kick-starter. Enclosed chain-drive optional.

Taking the  $3\frac{1}{2}$  h.p. 85x88 mm. engine as a standard, the B.S.A. Company have worked on several variations in transmission till they can offer a wide selection to the prospective buyer. They will show at Olympia a T.T. type with single-gear and belt drive, a tourist type with the B.S.A. free engine, a two-speed model with the B.S.A. two-speed hub and belt drive, and a two-speed model with the same hub, but chain driven. It is this last type, which is the most interesting, as it is a considerable deviation from the firm's usual practice, and has, therefore, been selected for a detailed description. The B.S.A. engine has been redesigned, and is now fitted with a very clean pear-shaped cylinder which is offset 10 mm. to the crank pin. The valves have been somewhat increased in diameter, and the ports improved in general design.

The tappet guides are fitted with very neat dust caps, which prevent the ingress of grit and also have a deadening effect on the tappets, which helps to reduce noise. Flat section valve springs will be used for 1913. The flywheels are now made of steel, as this has been found more satisfactory than cast iron. The dome-topped piston remains much the same as last year; it is a light piece of work, beautifully finished. On the crank-shaft is mounted the driving sprocket, which is driven through the medium of a simple spring drive. This consists of a stand anchor piece which carries three compression and three buffer springs, and through them drives a plate to which the sprocket is fixed. A short chain drives a counter-shaft, which is mounted eccentrically for adjustment purposes, and carries a clever out unusual form of kick starter. This works on the well-known B.S.A. free wheel system; a train of epicyclic gears is also interposed, so that, though the starter is kicked down backwards, a forward motion is imparted to the engine. This sounds somewhat complicated, but it is in reality a very neat and simple piece of work. From the counter-shaft the final drive is by a second chain to a sprocket mounted on the hub two-speed gear. This hub has proved so satisfactory that little change will be made in

The B.S.A. motor cycles may now be had with enclosed chain drive and two speed hub gear.

it, except that the balls will be carried in such a manner that they do not drop out should the hub be dismantled. Both chains are thoroughly protected by a single case, which is made in two pieces and is readily detachable. This model is fitted with neat footboards, the right one being pivoted so as to be swung out of the way for starting purposes. A new silencer is fitted in which the exhaust gas passes through a cone drilled with a number of holes. After this, part escapes through small holes in the silencer end and part passes out through a long exhaust pipe to the rear. In belt-driven models this pipe is cut off in front of the rear wheel and passes across to the off side of the machine. The frame remains practically unaltered, but a neat front wheel stand has been added which also forms the front mudguard stays.

### Other Details.

It will be remembered that the B.S.A. is one of the few firms which turn out a generator bracket integral with the front forks, a small point, but one of great convenience. The new B.S.A. carburetter,

described in our pages recently, is, of course, fitted to all models. Either a tapless pump or Best and Lloyd semi-automatic lubricator may be had at option. The footrests on the belt-driven model are adjustable in all directions, and are covered with neat rubber pads. The front wheel hub is of the knockout type, and may be removed by simply detaching one bolt. The pedal operating the two-speed gear has been much improved, and now works on a notched quadrant, a second pedal, conveniently placed, raising the catch from the notch when it is necessary to change down. A neat enclosed spring is fitted to the coupling rod which helps to hold in the low gear. With the exception of transmission details, the models resemble each other so closely that descriptions are unnecessary; but we may add that the T.T. model will have a rather longer wheelbase than usual, and that the handle-bars have been shortened on all models. The B.S.A. new models possess such originality that they are sure to be examined with interest at Olympia.

$3\frac{1}{2}$  h.p. 1913 model T.T. B.S.A. with off-set engine.

Auxiliary rear springing on the latest Singer cyclecar.

### ANOTHER NEW CYCLECAR

The Croydon Central Motor Co., High Street, Croydon, inform us that they are now engaged in building a cyclecar with friction drive, giving four speeds and reverse, propelled by an 8 h.p. J.A.P. engine

### TIME TO LIGHT LAMPS.

Nov. 21st	...	5.2 p.m.
" 23rd	...	5.0 p.m.
" 25th	...	4.58 p.m.
" 27th	...	4.56 p.m.

### Red Rear Lights on Vehicles.

The Surrey County Council passed a byelaw last week making it compulsory for vehicles to carry either red rear lights or reflex lights.

### News.

It is probable that a Dursley-Pedersen four-cylinder air-cooled cyclecar will make its appearance at Olympia next week. Some weeks ago we referred vaguely to experiments which were being made with the vehicle.

### Club for Brighton and District.

A meeting has been called of Brighton and district motor cyclists at 190, King's Road Arches, for 8 p.m. on Wednesday, December 4th, with the view of forming a motor cycle club in connection with the Brighton Cyclist Club. Communications should be sent to Mr. George White at the above address.

### Educating the Public by Cinematograph.

A private exhibition of a film depicting London traffic conditions will be given at the next council meeting of the R.I.A. This Association is considering the possibilities of the cinematograph for (1) educating the general public how to avoid common traffic dangers, and (2) demonstrating to the authorities cases of needless traffic congestion, dangers, etc.

### A.C.U. Badges.

After November 26th the Auto Cycle Union badge will be sold at 3s. instead of 6s., as hitherto. We are glad to say that the artistic design has not been altered in any way. The badge is made to fit the front mudguard extension, the handle-bar, or to attach to the top of the lamp, where undoubtedly it is most conspicuous.

### International Federation of Motor Cycle Clubs.

At the meeting on Thursday of Show week, called to re-found the I.F.M.C., Mr. Mervyn O'Gorman has agreed to take the chair. The English delegates are Messrs. E. M. P. Boileau, G. F. Sharp, L. Meyrick-Jones, and T. W. Loughborough. The Federation of American Motor Cyclists will be represented by Mr. W. H. Wells. Messrs. Longemare and Fenton will represent France, there will be a representative from Denmark, while Belgium will have four representatives—Baron Northomb, M. Fagard, Emile de Beukelaer, and M. Marchant.

### Midland Trial Results.

The results of the reliability trial organised by the Sutton Coldfield A.C. have now been issued. H. G. Dixon (3½ h.p. New Hudson and sc.) carries off the Sutton Cup and gold medal as well as the first prize for best performance on a sidecar; 2, A. D. Arter (James sc.); 3, W. B. Gibb (2½ Douglas). All the above accomplished a non-stop run and gained the maximum of 100 marks. The first amateur is R. H. Edwards (Triumph), who also secures the prize for best performance on a single-gear machine. The cyclecar prize was won by G. Bryant (8 h.p. P.M.C. motorette).

FUTURE EVENTS	
Nov. 25-30.	MOTOR CYCLE SHOW AT OLYMPIA.
" 27.	Meeting of Club Secretaries at Olympia.
" 28.	I.F.M.C. Meeting at Olympia.
Dec. 7.	M.C.C. Annual Dinner and Prize Distribution.
" ..	A.C.U. Open Silencer Trial.
" 27-28.	M.C.C. Annual Winter Run.

### Godfrey-Garrett Case.

Garrett's protest in connection with the announced result of the Hour Race at the B.M.C.R.C. meeting on the 9th inst. was considered on Monday. After lengthy and careful consideration the committee of the B.M.C.R.C. sitting in full attendance as stewards of the meeting, are of opinion that the evidence brought before them is not sufficient to contradict the judge's decision, and, therefore, the decision of Mr. A. G. Reynolds, deputy judge, stands. They are further of opinion that the method employed on the occasion in question of deciding the winner of a race against time, i.e., by direct observation of the position of the leaders at the exact conclusion of the time and period, is the correct one.

### An Unofficial Sidecar Trial.

A telegram from the Enfield Cycle Co., Ltd., announces a fine run under winter conditions from London to Edinburgh on a 6 h.p. Enfield sidecar. The driver was F. Begley, of the Motor Cycling Club, who intended to make a non-stop engine run throughout, and but for accidentally stopping the engine, his object would have been achieved.

### Cyclecar Hour Record.

Late on Tuesday afternoon last we received a telephone message informing us that the G.W.K. cyclecar had broken the hour record at Brooklands, covering 56 miles 75 yards. The previous best was 55 miles 23 yards.

### SPECIAL FEATURES:

"THE MOTOR CYCLE" BUYERS' GUIDE OF 1913 MODELS.

FORECAST AND GUIDE TO THE SHOW.

A FEW POINTS SIMPLY EXPLAINED.

### British Imports and Exports of Motor Cycles.

In the following tables will be found the value of motor cycles and parts which have been imported and exported by Great Britain during October and during the ten months ended October 31st.

#### IMPORTS.

	Month ended October 31st.	1910.	1911.	1912.
		£	£	£
Motor cycles	...	1,390	1,709	3,157
Parts thereof	...	4,559	3,018	38,433
Total	...	£5,949	£4,727	£41,590

#### Ten months ended 31st October.

	1910.	1911.	1912.
	£	£	£
Motor cycles	40,655	37,739	38,256
Parts thereof	47,032	54,847	134,862
Total	£87,687	£92,586	£173,118

It will be noticed that for the month of October, 1912, the imports are over nine times the amount of the corresponding month in 1911 (it will be interesting to observe if this huge increase is maintained), while for the ten months of 1912 the amount is not quite double the amount of the same period in 1911.

#### BRITISH EXPORTS.

Month ended 31st October.				
	1910.	1911.	1912.	
	£	£	£	
Motor cycles	15,906	33,020	68,130	
Parts thereof	2,847	7,844	26,195	
Total	<u>£18,753</u>	<u>£40,864</u>	<u>£94,325</u>	

It will be seen that the exports for October, 1911, are less than half the amount for the corresponding month this year.

#### Ten months ended 31st October.

	1910.	1911.	1912.
	£	£	£
Motor cycles	93,346	198,293	420,793
Parts thereof	32,063	56,568	151,267
Total	£125,409	£254,861	£572,065

Again the exports for 1912 are over double the amount of 1911.

The above tables show that the exports for 1912 are over three times the amount of the imports, or £572,065 exports, against £173,118 imports.

**77,855 Copies of "The Motor Cycle."**

The circulation of this journal continues to increase at a rapid rate. No less than 77,855 copies were printed last week. In the corresponding week of last year the number was 65,000, and in the same week of 1910 51,130.

**Olympia.**

Hundreds of motor cyclists visited the Car Show at Olympia last week, the half-dozen cyclecars exhibited attracting much attention. By the way, the total attendance at Olympia approached a quarter of a million.

**Pity the Poor Editor!**

We naturally receive many curious enquiries among the applications for information received at this office, but the latest problem we are asked to solve is as to whether Somebody's system of increasing the height is genuine or not!

**Record Attempts.**

We were glad to see G. E. Stanley out again last week, much better from his attack of quinzies. He told us that he would attempt a number of lightweight records at Brooklands this week on his new 350 c.c. single-cylinder Singer machine if he felt well enough.

**Dates of 1913 Events.**

A meeting of club secretaries will be held in the concert room at Olympia on Wednesday, the 27th inst., at 4.30 p.m. The meeting has been convened in order to arrange dates for open competitions to be held during next year, in order to prevent clashing as far as possible.

**London to Constantinople.**

After the present war in the Balkans it is probable that at least one great main road will be constructed right through to Constantinople. It will be remembered that the two motor cyclists who left London last August to ride to the Turkish capital succeeded in attaining their object. Previous to this Mr. R. L. Jefferson was the first motorist to get through by road. The motor cyclists are Auto Cycle Union members, and were, of course, aided by the Union in the accomplishment of their object.

**A.C.U. Note.**

The A.C.U. has decided upon special insurance rates for cyclecars. Previously, insurance companies have quoted light car rates for these vehicles.

**Frank Philipp Progressing Favourably.**

We are pleased to say that Frank Philipp, the well known Scott rider and secretary of the Scott Engineering Co., is progressing favourably. He was allowed to write for the first time last week, and informs us that the fractures sustained in the accident are all going on as well as possible.

**French Hour Record.**

Our contemporary, *L'Aero*, says that a French rider, named Lombard, will make an attempt on the 500 c.c. French hour record probably before this issue is in the hands of our readers. He rides an Albatros, and the attempt is to be made on the Parc des Princes Track, Paris.

**Show Excursions.**

The Motor Cycle Manufacturers' Union have arranged for excursion trains at cheap fares to run from practically every town in the kingdom to London for the Cycle and Motor Cycle Show at Olympia on November 25th to the 30th inclusive. Readers should enquire for particulars of these excursions at their nearest railway station. On another page we give some information regarding the best train and bus routes from the chief London railway termini to Olympia. The exhibition will open at 10 a.m. each day and close at 10 p.m. Arrangements have also been made with the L. and N.W. Railway Co. to run a special through train from the Midlands direct to Olympia on Monday morning, the 25th inst., to arrive ten minutes before opening time. This train will leave the undermentioned L. and N.W.R. stations as follows: Wolverhampton 6.45, Dudley 6.25, Dudley Port 6.55, Birmingham 7.25, Coventry 7.55, Willesden 9.40, and will arrive Addison Road at 9.50. There will be no intermediate stops. Breakfast cars will be provided, but seats for breakfast should be ordered in advance from Mr. Alfred Bednell, secretary, 13, Queen Street, Coventry.

**A Stolen Machine.**

1910 Bradbury, registration V 743, no pedalling gear, tank dented, Michelin and Dunlop tyres. Information regarding it should be addressed to "W.J.H." c/o the Editor.

**Belated Particulars for the Buyers' Guide.**

Service,  $3\frac{1}{2}$  h.p. J.A.P. or Precision, Armstrong three-speed hub, 53 guineas; 6 h.p. sidecar model, J.A.P. or Precision; both machines are fitted with B. and B. carburetter, Dunlop or Hutchinson tyres. Connaught two-stroke, 3 h.p., 292 c.c., Amac,  $\frac{3}{4}$  in. belt, Michelin tyres, Armstrong or Sturmey-Archer, weight 115 lbs., £33 10s., or £44 with three-speed gear.

**Paris-Nice-Monte Carlo.**

Our contemporary, *L'Aero*, is organising a race for motor cycles from Paris to Nice and Monte Carlo from February 1st to 5th next. The organisers anticipate that this event will be very successful, particularly as the competitors will arrive at Nice while the Carnival is in full swing. The organisers expect that several British competitors will take part.

Entry forms and further particulars can be obtained from *L'Aero* offices, 23, Boulevard des Italiens, Paris.

**First Speed Trial at the Cape.**

A very successful speed competition took place on the 26th ult., organised by the Cape Peninsula Motor Cycle Club. Riders had to do a trial run, and in the second attempt to improve upon the first made time, the man nearest to 6% improvement to be the winner. Distance, one and a quarter miles. Results:

Rider and machine.	Time in secs.	Per-centage in improvement.
1. H. S. Olive (7 Indian) ...	77 $\frac{3}{4}$	5.61%
2. J. Ockleford (3 $\frac{1}{2}$ Rudge)...	92 $\frac{1}{2}$	4.55%
3. A. Douglas (3 $\frac{1}{2}$ Triumph) 83 $\frac{1}{2}$		2.11%

A very fine stretch of road had been discovered, and in the shade of the abundant foliage motorists gathered for the first speed contest of the C.P.M.C.C. Thornton (3 $\frac{1}{2}$  h.p. T.T. B.S.A.) made the fastest time of the day—70 $\frac{1}{2}$ s. The only sidecarist to compete was O. J. Prillewitz (6 h.p. Enfield), who gained fifth position.

FIRST SPEED CONTEST AT THE CAPE, ORGANISED BY THE CAPE PENINSULA M.C.C.

Great interest was shown in J. Thornton (3 $\frac{1}{2}$  h.p. T.T. B.S.A.), who made the fastest time of the day.

J. Ockleford (3 $\frac{1}{2}$  Rudge) finishing well up to time. He secured the second prize.

### Crossgates and District M.C.C.

The club will hold their first annual whist drive and dance at the Recreation Hall, Crossgates, on the 29th inst.

### Herts County A. and Ae.C.

The fourth quarterly trial will take place on Saturday, December 14th. The route will be very similar to that of the third trial, and the hon. secretary for the event will be Mr. G. S. Carter, Aplins Close, Harpenden, Herts.

### Dewsbury M.C.C.

A reliability run was held on the 3rd inst., the route being *via* Leeds, Yeadon, Blubberhouses, Harrogate, Harwood, and home. The following qualified for prizes:

	Marks lost.
1. H. Hainsworth (3½ Triumph) ... ..	4
2. J. Rispin (3½ Bradbury) ... ..	7
3. S. Naylor (3½ B.S.A.) ... ..	20

HUMBERETTE CLIMBING RED BANK, GRASMERE.

Last week we referred to a week-end trip of 500 miles to the Lake District, when the Humberette we observed succeeded in climbing Tow Top, Gammers How, and Red Bank, three notorious test hills in Lakeland.

### Mersey M.C.

The annual dinner and prize distribution will be held on the 22nd inst. at 6.30 p.m. After the dinner the annual general meeting will be held, to be followed by a smoking concert at St. George's Restaurant, Redcross Street, Liverpool.

### Lincolnshire A.C. (Motor Cycle Section).

A petrol consumption trial was held recently. Result on formula: 1, B. Rhodes (6 Zenith); 2, J. E. Harston (3½ Champion-Jap); 3, J. H. Brookes (3½ Rudge).

### Cheltenham M.C.C.

A speed-judging contest was held on the Cotswolds over a circular course. Result: 1, A. G. Meats (B.S.A.); 2, G. Nash (Triumph); 3, A. K. Lewis (Triumph).

A demonstration of the Veloce engine will be given on December 3rd, at the Belle Vue Hotel.

### Streatham and District M.C.C.

The winter programme has been sent round to the individual members of the club. Attention is called to the fact that a club room is now provided at headquarters, and the club evenings are Wednesdays and Fridays. The first of several very interesting lectures and discussions was held on the 15th inst.

### Workshop and District M.C.C.

The first annual reliability trial took place on the 13th ult., when twenty-four competitors took part and six tied for the first place, losing no marks. A re-run resulted as follows: 1, R. Bagshaw (6 Matchless and sidecar); 2, T. W. Barlow (5 A.J.S. and sidecar); 3, A. H. Imber (Rudge) and G. J. Burnett (Rudge).

### Motor Cycling Club.

The annual dinner and presentation of prizes will take place on December 7th (Saturday) at the Adelaide Gallery (Gatti's Restaurant) at 6 p.m. The president, Mr. Chas. Jarrott, will be in the chair, and Mrs. Jarrott has kindly consented to present the prizes. Ladies are cordially invited. An excellent programme of music is being arranged, and it is hoped that all members who can possibly attend will do so. Tickets, 7s. 6d. each, can be obtained from the secretary, Mr. Southcomb May, 34, Gower Place, W.C.

### Cyclecar Club.

The second meeting of the above club was held at the Connaught Rooms, Great Queen Street, at 8 p.m. on the 6th inst. Mr. E. Parnacott occupied the chair. The business of the meeting was to elect officers, fix subscription, etc. It was decided that the committee should consist of nine persons, of whom five should be unconnected with the manufacture or sale of cyclecars. The joint hon. secretaries are Mr. F. Thomas, 172, Belsize Road, N.W., and Mr. Osmond Hill, 19, Elsworth Road, N.W., from whom further particulars may be obtained. The subscription was fixed at a guinea with an entrance fee of 5s.

### Leicester County M.C.C.

Result of reliability trial held October 31st. The course was most severe, being one of the most strenuous in the county. There were four hills with gradients of about 1 in 4 and three watersplashes. No member made a non-stop, and the only competitor to negotiate the watersplashes was Harold Petty:

Rider and machine.	Marks lost
1. A. L. Barker (3½ T.T. Singer) ... ..	176
2. Harold Petty (3½ Singer) ... ..	191
3. E. Folwell (3½ T.T. B.S.A.) ... ..	206
SIDE CAR CLASS.	
1. N. Mee (8 Matchless) ... ..	201

Complete model of the 1913 Eric sociable.

### THE ERIC.

The Eric sociable, which is made by the P. and C. Syndicate, and will be exhibited on Stand 45, has been considerably improved. It is propelled by a two-cylinder horizontally opposed water-cooled engine, the thermo-syphon system being used, and the radiator being immediately in front of the engine and situated under the driver's seat. The valves are inclined, the cams working directly against the valve tappets. The magneto is placed on the crank case between the two cylinders, and is chain-driven. An Amac carburettor is fitted.

The lubrication is effected in the following manner: There is a sump in the crank base into which oil is poured, when the two pistons come together, the air pressure in the sump forces the oil into the crank chamber through a non-return valve, and while this valve is open, any excess of oil flows back into the sump.

In this manner a constant level of oil is always maintained.

The gear box and crank case are connected by a cylindrical aluminium casing, in which the leather-covered cone clutch is situated. A large inspection orifice is provided in this for enabling the clutch to be adjusted or dressed. To the cylindrical casing the gear box is bolted, which provides three speeds and reverse of the ordinary sliding type. The change is effected through a gate. From gear box to rear wheel the transmission is by cardan-shaft, the final drive being by bevel.

### Rear Springing.

The frame is constructed of heavy gauge tubing, and is suitably trussed where necessary. The back wheel is sprung in a somewhat unusual manner; the triangular portion of the frame, which carries the back wheel, has the cross-bar hinged at the bottom, and on the bar is

anchored a quarter-elliptical spring, the upper portion of which is attached to the rigid portion of the frame. This allows the back wheel to rise and fall vertically and yet to be sprung in a comfortable manner. The front portion of the frame is supported on half-elliptical springs.

By undoing a nut on the off side of the back wheel spindle the chain stays and back forks may be swung to one side, allowing free access to the tyre. It is interesting to note that the vehicle is provided with detachable rims; these are provided with two bosses each side of the valve hole which engage with corresponding slots in the felloe, while at the opposite side of the rim are two eyes, which register with two similar eyes on the felloe, allowing the tyre rim to be

One of the features of the 1913 New Imperial machines is that the carrier and rear mudguard may be swung down, as shown, to facilitate tyre repairs.

bolted to the felloe. This detachable rim is exceedingly simple. A side hand lever controls the band brake on the rear wheel axle, while a pedal operates the external brake on the gearshaft. The steering is by chain and sprocket, and wires are carried from the chain direct to the steering arm. The extremity of each wire is provided with a coil spring which is held in tension and thus lessens shock and strain on the wire.

The twin-cylinder horizontal engine and gear box of the 1913 Eric sociable.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address

#### Fair Treatment.

Sir,—I have read (Rev.) W. A. Douglas Hamilton's letter in *The Motor Cycle*, dated 14th November, stating the treatment received from Messrs. Douglas Bros., which is decidedly on the generous side. All motorists will be pleased to note this action, and nothing but good business can follow.

My reason for writing you is to state my case fairly in regard to the Rex Motor Co., Coventry. I had the misfortune to break a connecting rod, after the time of guarantee had passed and a distance done exceeding 3,000 miles with heavy sidecar outfit, fitted specially for business purposes, covering the whole of hilly Devon and Cornwall.

My treatment beats the above, inasmuch that I did not pay carriage either way for the engine sent or returned to me, and that is not all, the engine had a real overhaul that made the machine. It has since done many hundreds of miles, without the least thing going wrong, and I am so pleased that I shall certainly see the latest production at the Show. I have no connection with the Rex Co. other than as a satisfied rider. T. D. A. CHAPMAN.

#### Reliability Trials. A Suggestion.

Sir,—In Mr. Davies's admirable "Open Letter" he expresses the hope that prices may be reduced in 1913. I wish to suggest in outline a way in which this could be accomplished. Let future reliability trial awards be given on a basis of actual running costs. All petrol, oils, tyres, and belts used during the trials would be charged for, and to this would be added the initial cost of the bicycle. The grand total would be divided by the mileage of the trials, and on these results prizes would be awarded.

Various classes would be necessary, and the trials would have to be sufficiently severe to eliminate weaklings, but the main result would be that if, say, a very low-priced bicycle could really weather the trials it would win, and down would come all other prices. If, on the other hand, cheap bicycles are dear in the end, we should know it for certain.

Nothing, to my mind, however, is more stupid than the present distribution of endless numbers of gold medals. It would be scarcely less ridiculous to give a gold medal to every competitor who reaches the first control on the first day.

I trust you will find space to print this, and if it evokes a storm of adverse criticism from makers, then it will be certain that we are attacking prices on the right lines.

W. A. JESSOP.

#### Petrol Gauges.

Sir,—I was astonished to see in a contemporary journal last week a description of the old device of a cork float which actuates a hand on a dial on the top of the tank as it rises and falls described as a "new" petrol gauge. It was possibly "new" over thirty years ago when an uncle of mine patented a similar device for paraffin lamps. The cork float cannot begin to rise until the greater part of it is submerged, and, therefore, does not indicate a small quantity, just when an indication would be most useful.

The friction of the cork on its guides and on the central worm together with that of the bearings make the rising and falling of the float very uncertain. It is in this respect worse than the older variety with a wire rising through the top of the tank, and every user of these will remember how he always wondered whether it was indicating properly or not.

I have made several gauges of this type for customers who specially desired them, and know from the experience that, just as the earlier steam boilers started with a prototype of this device, a float, and now universally use a gauge glass, so will history repeat itself and the "fittest" survive for motor cycle tanks. A. C. DAVISON.

#### An Unborn Runabout.

Sir,—Your paper influenced me to start motor cycling many years ago, and later pointed out the advantages of possessing a cyclecar.

Accordingly I purchased one, and have ever since waited patiently for Thursday morning to see what was to be said in favour or otherwise of our runabouts.

"Ixion's" remarks are to the point, but I don't agree with everything he says. As to comfort, you won't find any car more delightful to sit in than a Bedelia, and after a long run you don't feel that awful stiffness that thin people experience after sitting for some time in a car.

Of course, the ideal cyclecar should have side by side seats, no belts, and reasonable comfort. We don't want a small Rolls-Royce. "Ixion" speaks about the price of these vehicles. I entirely agree with him. Manufacturers list their cars at far too high a rate; £100 should buy any cyclecar on the market. And unless these prices come down I'm very much afraid that the boom will break.

I have talked the question over with many people, and they all say, "I should like a cyclecar if the price was right, but I am going to get a 20 h.p. car, which is just as cheap as a cyclecar." No. Let some firm go in for cyclecars exclusively, and turn out a good number per week, so that we can have a decent four-wheeler, that is worth £100, complete with tyres, lamps, bolts, etc., with hood and screen, and not listed at about £130. In my opinion, unless this is done, we will find the small car ousting the cyclecar out of existence.

I enclose my card and sign myself ENTHUSIAST.

Sir,—I am common with most other writers, "Admirer of All" omits from his interesting letter in *The Motor Cycle* of the 7th inst. all reference to a class of would-be cyclecar owners which, personally, I believe to be quite large enough to claim attention from manufacturers. I mean those people who are only deterred from keeping a small pony and cart by the work and trouble which would be involved. An hour and a half spent every day feeding, cleaning, and bedding, and special arrangements when his owner desires to leave home, are a few of the more obvious points in the pony's disfavour. He is quite fast enough. The only service asked of him is to take his owner and wife, or children, to a town, say, eight or ten miles away, to church, or for an afternoon drive, at the most two or three times a week.

Surely this is a need which could be most appropriately met by the cyclecar. Bearing in mind the cost of a pony and cart capable of the work—say £30—it is evident the initial cost of the cyclecar must be substantially below £100, even though it will be cheaper to run. This at once rules out three-speed and reverse gear boxes, water cooling, fancy coachwork, etc., etc., which indeed are not required.

Who will be the first maker to offer the "Junior car" at £50? RUSTICUS.

[The £50 four-wheeler is a long way off. The cheapest passenger machine by far is the motor cycle and sidecar.—Ed.]

# present to you the **BULL** Mileage Competition

JOHN BULL T.T. Covers from the time of purchase to September 30th, 1913, the closing date of the competition.

When this record is completed, and the chart shows the total mileage covered by the competitor from the day of purchase to September 30th, 1913, it must be posted to the manufacturers together with the voting card upon which, judging from his own experience, the competitor must give the spaces provided his estimate of the average mileage as above, and a report as to the condition of his tyre at the time his own record was completed.

The competitor whose estimate is nearest to the actual average mileage, worked out from the whole of the competitors' returns, will receive the prize, and two independent judges will be appointed to proclaim the winner.

Voting cards and mileage charts will only be obtainable on purchase of a JOHN BULL CROSS GROOVE T.T. Cover, either through an agent singly or fitted to complete machines, and every person competing must advise the manufacturers of his intention so to do within the days of purchase, for which purpose a printed postcard will be found attached, with voting card and mileage chart, to every cover.

Now you'd like that Cyclecar, wouldn't you?—then take the first step now, viz.—fill in the Coupon below and post to the manufacturers to-night. In response they'll send you all the details which you ask for together with full particulars of the tyre concerned—the tyre with the compressed rubber tread—the tread that means more mileage.

For The Leicester Rubber Co.,

### Waterproofing for Motor Cycles.

Sir,—Your correspondent "Mudlark" is slow, very slow, waiting some years for the galvanising process to come along. Mr G. A. Wainwright, of Grape Street, Leicester, would, I feel sure, be pleased to electro-galvanise his motor cycle for him, even the smallest nut. I had a machine galvanised two years ago. It is used daily and the saddle only covered at night. I clean it about once in three weeks with a bucket of water and a brush, followed by, first, a dry, then an oily rag. The galvanising scarcely shows signs of wear. I have no interest in Mr. Wainwright only as a customer.

SKIDMORE.

Sir,—Since you published our name in connection with the waterproofing lacquer for the bright parts of motor cycles and cars, we have been inundated with enquiries and orders for this new speciality of ours. We were not prepared to supply the public—we are, as manufacturers, entirely in the hands of factors who stock our specialities. We should, however, like to mention that our chief reason for introducing a waterproof metallic lacquer was the numerous complaints we have received from our own travellers who are using motors, about their inability to keep their magnetos absolutely waterproof. In experimenting, with a view to solving this very important question for motorists, we have discovered this new method, which, according to the opinion of our own men who have now been using it for several months, has solved the most difficult problem of winter motor-ing.

JENSON AND NICHOLSON, LIMITED.

### The Springing of Cyclecars.

Sir,—We notice in your issue of the 7th inst., describing the Ariel runabout, there is a statement that "Lanchester springs are fitted to the rear wheels." We would point out that the illustration in no way bears this statement out. The illustration shows an ordinary quarter-elliptic spring, such as was used on the Oldsmobile car

The Lanchester Motor Co.'s rear springing (see letter).

some years ago, and differs vastly from the Lanchester system, both in principle and in detail of design.

Firstly, the Lanchester spring is underslung, *i.e.*, the spring is below the axle.

Secondly, the Lanchester spring does not act as a radius rod, which the quarter-elliptic spring illustrated on the Ariel cyclecar does.

Thirdly, the Lanchester parallel link motion, in conjunction with the half-elliptic cantilever spring, imparts a parallel motion to the back axle, instead of a radial motion, such as is given by the quarter-elliptic spring of the Ariel cyclecar, and all other would-be imitators of the Lanchester system.

We enclose herewith a photograph of Lanchester suspension, which illustrates the above points. We shall esteem it a favour if you will give this letter publicity, as the description and illustration of the Ariel runabouts are liable to give an erroneous impression of Lanchester practice to many of your readers.

THE LANCHESTER MOTOR CO., LTD.

### The Life of Epicyclic Hubs.

Sir,—Regarding "Ixion's" invitation for experiences of three speed epicyclic gears after a season's wear. I have had an Armstrong three-speed gear (sidecar model) on a  $3\frac{1}{2}$  h.p. Rover since February, during which time I have ridden the

machine 12,000 miles, 4,000 with sidecar and two passengers, without the slightest trouble or any replacements, and the gear appears as good to-day as when new.

I attribute my freedom from trouble to keeping it correctly adjusted and oiling every day. J. FARNSWORTH.

Sir,—I have read with interest the letter by W. Hunter with reference to gears, and should like to quote the experience which I have had with three-speed hubs, which has been somewhat different from that of Mr. Hunter.

I have this year run two machines, both Trump-Jap, one a 6 h.p. twin the other a  $3\frac{1}{2}$  h.p. single, both fitted with Sturmey-Archer three-speed gears. I have, on the 6 h.p. twin, covered about 5,000 miles, and upon the  $3\frac{1}{2}$  single over 30,000. During the whole of this distance I have been stopped once on the road, due to a failure of the gear, this being in the case of the  $3\frac{1}{2}$  h.p.; in no other instance have I had any trouble whatever except the occasional adjustment which is always necessary with this type of gear.

I do not agree with Mr. Hunter that a two-speed gear is preferable to a three-speed, as I think a little experience of both will show. D. A. PEARSON.

### Nail Catchers.

Sir,—If you would allow me to take up a small space in your paper, I should like to offer a useful hint to fellow motor cyclists.

I cannot emphasise too strongly the necessity of using "nail catchers" on both tyres. I have used the thin strips of metal fastened to the stays of the wheels, that are standardised by some firms, and found them quite useless, unless an extra large nail should be picked up—a thing that very rarely happens.

A quite inexpensive way of making nail catchers that will prevent the smallest nail or even thorn from entering and so puncturing the tyre, is to purchase a couple of steel burnishers consisting of a series of small steel rings entwined and trailing them over the tyres so that they actually touch the whole time.

I have ridden well over 3,000 miles on my 1912 Triumph and have not had one single puncture up till now. I weigh twelve stones, and have frequently carried a ten stone passenger on the carrier (a dangerous proceeding) over dreadful roads with half inch of grit and flints. I have made careful tests, and find that on each revolution of the wheel practically all the grit is wiped off as soon as it passes the chain, thus minimising punctures.

I admit there is a slight wear on the tread owing to friction, but it is very slight, and certainly worth it considering the saving in punctures. Personally I use rubber-studded tyres, but the same effect is got from any other pattern, with one exception, and that of steel-studded tyres—the danger here being that after the tyre has had a little wear the studs are liable to be pulled out by the chain.

P 7098.

### The Records of Cyclecars in 1912.

Sir,—It may be of interest to some of your readers who are confused by the multitude of cyclecars to sum up the results of the main events on road and track in which cyclecars have taken part this season.

1. M.C.C. London-Exeter: Morgan, one gold medal; A.C., one gold medal.
2. M.C.C. London-Edinburgh: Morgan, one special gold medal; A.C., one gold medal; Chater-Lea, one gold medal.
3. Scottish Six Days' Trial: G.W.K., one gold medal.
4. English Six Days' Trial: Morgan, one gold medal and silver cup; G.W.K., one gold medal.
5. A.C.U. Spring Trial: Autotrix, one first-class certificate.
6. A.C.U. Autumn Trial: G.W.K., two first-class certificates; Morgan, one first-class certificate.

The Duo and Humberette each entered for one event, but did not obtain a first-class award. No other cyclecar competed in these events. They had no doubt sufficient reasons, but it seems a pity they held aloof.

On the track at Brooklands, the Morgan won the first cyclecar race (average speed, 49 m.p.h.) The G.W.K. won the hour cyclecar race at the Championship meeting in October (47 m.p.h.) The November Olympic one hour cyclecar race was easily won by the Morgan (55 m.p.h.), which holds the hour record. E. S. B. SYDNEY.

### The Wear of Small Engines.

Sir,—I note in your issue of November 14th that a correspondent (Mr. Claude Middleton), after detailing an abnormal list of new parts, rendered necessary by a mileage of 7,000 covered on his 1910 Douglas lightweight, invites owners of 1912 lightweights to give their experiences.

I am quite certain that owners of Douglas machines, of whatever year, while sympathising with your correspondent, will contest stontly that such experience is anything but exceptional.

Since I purchased a 1912 Douglas in the early part of this year, I have covered a distance of quite 3,250 miles, which equals that covered by your correspondent before he was advised to fit new cylinders and pistons. The only part which I have replaced is an exhaust valve spring, and I do not think there is a part of the engine which is not in as good a condition as on the day on which I took delivery. I can only imagine that your correspondent may have been rather too sparing with his lubricant.

I am glad to note, however, that he is still an advocate of the horizontally-opposed twin, and feel sure that he will have reason to withdraw his criticism after riding a second 7,000 miles.

May I add the usual disclaimer.

F. L. B. DYNE.

### Power for Sidecar Work.

Sir,—Having read with interest several letters in your columns relating to the power required for touring purposes with a motor cycle and sidecar, I beg to write a few lines with reference to my experience of a  $3\frac{1}{2}$  h.p. two-speed Humber and sidecar.

After severely testing the combination with an eighteen stone passenger on the steepest and roughest hills in this district (Lancashire), I tried it on a rough surfaced hill with a gradient of about 1 in 8.

The result was far beyond my expectations; the machine with sidecar and four extra passengers actually started and went up without a falter. The total weight of passengers alone was forty-four stones. We then descended and started in the middle of the hill, but the result was just the same.

The half compression device is a decided advantage, as it allows a slow speed and easy pick-up without the slightest knock in the engine.

Considering that I use the machine for business and pleasure purposes, over all kinds of roads and in all weathers, I trust to be allowed to express an opinion. I have no hesitation in saying that a good  $3\frac{1}{2}$  h.p. motor cycle, with a variable gear and lin. rubber belt, is quite ample for anyone, except the "road hogs" who foster disgust on a most enjoyable pastime.

Permit me to add that I am in no way connected with any motor or accessory company, but simply a satisfied owner and ordinary everyday rider.

W.B.

Sir,—I am a reader of *The Motor Cycle* of some years' standing, and it has occurred to me that some of your readers may be interested to know what a good  $3\frac{1}{2}$  h.p. single-cylinder motor bicycle can do with sidecar attached. My machine is a three-speed Bradbury, and a few days ago I drove it with the load depicted (43½ stones), consisting of my wife and daughter in the sidecar and Mr. Manthorpe, local Bradbury agent, on the carrier, up the Magazine Hill in Phoenix Park (Dublin)

Photograph accompanying Mr. W. Parker's letter.

on top gear,  $4\frac{3}{4}$  to 1. The photograph enclosed speaks for itself. I have no interest whatever in the Bradbury Co., but am a satisfied user of the machine, which is excellent either for solo or sidecar work.

W. PARKER.

### Exhaust Whistles.

Sir,—Your reply to "D.S." re exhaust whistle in the issue of the 31st ult. is a little misleading if used in a general sense, and we should like to point out that, whilst most exhaust whistles use a valve to obtain sufficient warning sound, we, with our Garner M.C. alarm, do not employ any such means, the exhaust gas having greater release immediately the alarm is operated.

There is therefore a free passage for the exhaust, and no likelihood whatever of back pressure, and we should say that the engine would be cleaned rather than carbonised by the use of the Garner M.C. alarm. HENRY GARNER, LTD.

### Loose Bushes.

Sir,—For some time past I have been troubled over a mysterious sound in the engine of my 1912  $3\frac{1}{2}$  h.p. two-speed machine, which, for a considerable period, baffled all my efforts to elucidate. The noise sounded like a distant "reaping machine" and worried me considerably, and I have just solved the mystery. I find that other riders of the same make machine are, or have been, similarly troubled, hence my writing you to set such at their ease. I find that the magneto gear wheels have worked their bushes loose in the timing cover, and these revolve in the aluminum casting, thus causing the peculiar sound. These bushes are only a pressure fit in the soft aluminum, and, upon taking off the half timing cover to investigate, all five bushes dropped out. However, a steel strip collar wrapped round the bushes has restored the pressure fit.

BONA SATIS.

### Motor Cycle Taxation.

Sir,—If your correspondent, P. W. Morrice, "who owned a motor cycle in 1901," feels that his 8 h.p. car costs him more, and is not, on his own showing, so satisfactory as a sidecar, why not make the obvious exchange?

I do not hesitate to assert that the average small car makes more noise than many powerful sidecars, such as the standard Chater-Lea, Clyno, Enfield, and Indian, to instance a few of the first that come to mind.

Anyhow, noise does not affect the question of taxation, and P. W. Morrice's display of adjectives is quite uncalled for.

P. H. LOVEGROVE.

# Victoria

In a crowd the Victoria Motor Bicycle always stands apart—its very distinctiveness ensures that—And just as that distinctiveness picks it out from the multitude of commonplace productions—So does its efficiency prove it entirely worthy of "a place apart." Its h.p. is  $3\frac{1}{2}$  and its specification includes—

**ALWAYS VICTORIOUS.**

*Precision Engine, single cylinder 85 m/m bore x 88 m/m stroke with mechanically operated side by side valves and variable pulley; specially designed Druid patent girder spring forks; Bosch high-tension magneto chain driven; Brown & Barlow carburettor with handle-bar control; Dunlop rubber belt; Dunlop heavy rubber studded tyres; Brooks B 170 saddle; and an exceptionally full equipment.*

And we ask you to note its price—

**£38 0 0** complete—  
and compare with "the rest."

Full details from—

**Victoria Motor & Cycle Co. Ltd.,**  
VICTORIA WORKS, DENNISTOUN, GLASGOW.

Write us to-day, or see us at—

# THE MOTORCYCLE BUYERS' GUIDE OF 1913 MODELS

## COMPLETE SPECIFICATIONS of all MOTOR CYCLES on the BRITISH MARKET.

We repeat in up-to-date form, and at the most opportune time of the year, this most useful feature which first made its appearance in "The Motor Cycle" of 1906. The third annual Olympia Show of motor cycles and accessories opens on Monday next, the 25th inst. This issue contains a full specification of every machine to be exhibited, thus the prospective purchaser may examine any particular model which appeals to him, having in his possession complete details and the price, without troubling the stand attendants. For ease in referring to the numerous details, we offer the following hints: A straight edge, or a piece of folded paper, renders the line much more easy to follow. Abbreviations to reduce space have perforce been made. For instance, in the case of change speed gears it must be understood, that when no make of gear is specified by name, the variation of the ratio is made by adjusting the engine pulley. All other abbreviations will, we feel sure, be rendered clear by reference to the following list. Though every effort has been made to avoid inaccuracies, we cannot be held responsible for any errors that may have occurred:

**INLET VALVES**—M = Mechanical. S.S. = Side by side. O. = Overhead. A. = Automatic. H.C. = Hand controlled air.  
**VARIABLE GEARS**—C. = Counter-shaft. E. = Engine Shaft. H. = Hub. F.E. = Free Engine. TRANSMISSION.—Com. = Combination of two systems.  
**TYRES**—A. = Avon. C. = Continental. D. = Dunlop. H. = Hutchinson. J.B. = John Bull. K. = Kamp-hall. L. = Li arty. M. = Michelin. P. = Palmer. F.U. = Palmer Cord. R. = Rom. W.M. = Wood Milne.

# SINGER

### 4 h.p. WITH TWO-SPEED GEAR AND SIDECAR

covered 30,000 miles in 34 weeks.

He rode as illustrated—the weight of the machine, rider, and passenger was 780 lbs.—the roads covered were some of the worst in the three kingdoms, and—the weather conditions during the greater part of the ride indescribably bad—

Yet, withal, he covered the whole distance without a single mechanical trouble, and incidentally set up the following records—

20,000 miles in 20 weeks.

Round the Coast of Great Britain—London to London—  
5,000 mile—in 33 days.

Round the Coast of Ireland—Dublin to  
Dublin—1,576 miles—in 12 Days.

That's proof of SINGER SERVICE,  
and you can see the actual machine  
with all our other models, if you  
will call at Olympia.

# ZENITH

**You should read this description of the new ZENITH kick-starter.**

"By far the most ingenious and interesting innovation on next year's Zenith is the free engine and kick-starter, which will be fitted to order only. In the back hub there is an Albion plate clutch controlled by a quick pitch thread, and worked by a pedal and Bowden wire from the offside footrest. This pedal is fitted with a toe release, so that the clutch may be held permanently out of engagement or instantly engaged. The brake is in this case worked from the near side footrest. The kick-starter pedal is attached to a spindle running through an eccentric bearing on a carrier slotted at the end to take the rear wheel spindle and sliding in a bearing at its forward end, so that the whole control mechanism can slide with the wheel. As regards the kick-starting device, the free-wheel, which is connected by chain to a sprocket on the rear wheel spindle, is attached to the kick starter spindle so that it may be easily dismantled if required. The eccentric bush is, of course, for facilitating the adjustment of the chain. The whole design is well carried out and reflects great credit on the company's works manager, Mr. F.

W. Barnes, who has had it under test on his own machine for some time."

*The Motor Cycle*,  
October 24th.

**'BARRED' at OLYMPIA. See the new No. 112 models on STAND**

This, and all the special features of the ZENITH, including the world-renowned GRADUA GEAR, will be available there for minute inspection. You cannot fail to be interested in the machine which has gained FIRSTS in every important Trial during the past season. Remember this is

ADDRESS : 20, TUDOR STREET, LONDON, E.C.

## Olympia.

THE third Olympia Show organised by the Motor Cycle Manufacturers' Union, which was opened on Monday last, will be looked back on in years to come as a thoroughly representative exhibition. Practically every stand bristles with the latest in motor bicycle, sidecar, and cyclecar construction, and a prospective purchaser who leaves the Show without having arrived at some idea as to what his motor mount for 1913 is to be will be either difficult to please or so bewildered with variety that he will reserve his order until he can consult an expert friend.

We found when inspecting the motor cycle exhibits that, broadly speaking, the bicycle frames are little changed—to the casual observer they are not altered at all from last year—but there are, nevertheless, to be practised eye evidences of detail refinement and a general strengthening up, particularly where sidecars are to be permanently attached, *i.e.*, used almost constantly with the bicycle.

Gears are by no means settled; for serious sidecar riding in general and touring the all-chain drive is undoubtedly correct, and preferably with a multi-cylinder engine of about 5 h.p. Solo tourists have a choice of all belt and three-speed hub, all chain and counter-shaft two or three-speed gear, combined chain, gear and belt and infinitely variable gear between two points.

Engines are receiving more and more that close attention which only comes as design is settling down. Makers are looking more carefully into the lubrication question. The life of any petrol motor depending so much on correct and even oiling of all the parts, it is essential that this point should have the most careful tests, and signs are not lacking that this is forthcoming to a very large extent.

Mudguarding of engine, rider, and transmission is vastly improved; far-seeing firms are standardising belt guards, and entirely enclosed chain drives are becoming quite common. The stowing and carrying of tool cases is one of the items which many makers have improved, and numbers of these fitments are now fitted with metal frames, so enabling the leather portion better to retain its shape. Although the motor bicycle in most cases is as well designed as it is possible for it to be under existing conditions, we cannot refrain from mentioning that in comparison with many portions of a motor car there is still room for simplification

and reduction in number of parts. The average man is apt to make comparisons between the two, and think a motor bicycle complicated when he sees so many working parts exposed. Simplicity combined with efficiency is the keynote to strike, and there is always room to make details more simple.

Brakes are wonderfully efficient in these days, but none should be so fitted that they increase trouble in removing a wheel. Most brakes in the Show are greatly improved. In an exhibition it is, of course, excusable to polish everything on a motor cycle or car till it both attracts and dazzles, but we think it would be a good idea if every firm were to show one example of the same highly plated and enamelled machine, finished in grey paint only, just as a reminder that it is not necessary always to keep that glittering plate like a mirror. A few firms do adopt this course, but if more were to follow suit we do not think it would be a bad business move.

Novel sidecar frames and bodies are quite a predominant feature; the former are in most cases lower than before, and security of attachment has been more carefully studied. The bodies on many sidecars are most luxuriantly fitted, and with easy springing suited to the passenger's weight are more comfortable than many cars. Hooded, screened, and sprung as they are, their popularity will increase, because there is nothing to equal a sidecar as a passenger motor vehicle in first cost, maintenance, speed, and efficiency.

The greatest interest is displayed in the miniature motor cars, and the cyclecars of both three and four-wheeled types. Orders will, we know, flow in for these handy little runabouts, which should in many cases cost little more to maintain than a sidecar. While there are tried and tested designs on view, many of them have hardly smelt the road, let alone been tested as they should be for a few thousands of miles before being offered to the public. Like the motor bicycle, the fittest will survive, but we think some are born to disappointment. There are examples of great excellence which reflect the utmost credit on their producers, and we wish them all the best of good fortune and success during the coming year. The performances of the untried ones will decide to a very great extent whether the public will obtain the same amusement and good health from their use as they have done from motor bicycles and sidecars, and the few tried cyclecars there are on the road.

OCCASIONAL  
COMMENTSBY  
"IXION"**Lightweight Maintenance.**

The Scottish correspondent whose experiences I described on November 14th has now forwarded some additional details. He omitted to charge up his spare belt, and now explains that two belts were concerned in the surprising mileage of 5,800, but that the spare was purchased in July, 1911, and had run 1,500 miles before the season started. In other words, with two belts he claims to have covered 7,300 miles, and asserts that both are in excellent condition. He answers my astonishment at the behaviour of his engine chain by explaining that it is periodically removed and soaked in grease, saying that friends of his, using similar machines, wear out both chains and sprockets in much shorter distances, because they merely oil the surfaces of the rollers with the chain *in situ*. Under any circumstances such a transmission experience must be regarded as extremely satisfactory.

**Engine Silence in 1913.**

It will be interesting to see whether threatened legislation and consequent modifications in design procure a real advance in engine silence next year. So far as I can see, the similar pressure in the car world has effected very little improvement. In many provincial towns, where the police are neither expert jurists nor motorphobes, a keen observer would find no evidence for supposing that circumstances had changed; possibly the road-hog type of driver is a little more considerate in the use of his cut-out, and that is all. Personally I hope that the corresponding movements in the motor cycle world will extend no further. I regard a really quiet motor bicycle as a public danger. An inaudible car is dangerous, but it is less dangerous than an inaudible motor cycle, because it is larger, and the eye helps the ear in assisting to keep reckless pedestrians out of danger. There would be no genuine cause for complaint if the new pressure prevented road-hog motor cyclists from driving on the open exhaust in populous places. Some of the modern ultra-efficient engines, with perfect tuning, peculiar valve timing, and open exhausts, create a perfectly abominable and unpardonable noise; and numerous bounders have often driven such machines through towns and villages, not only on ordinary occasions, but late at night, early in the morning, and on Sundays. This ought to be stopped, and will be stopped. But it is ridiculous to fuss about the noise created by a standard roadster machine of 1912 design with the cut-out shut. It is only the novelty of its noise which sets people talking, for there are many long-established noises which represent a far more genuine nuisance.

The swift passage of a heavy tram, the shouting drovers and barking dogs in charge of cattle, the whistles of locomotives, railway shunting, the rumble of a heavy traction engine or caravan, the squeaking

BIG

of a cumbrous waggon, barrel organs, street play brass bands, etc., etc., are all far more tiresome. Behind most of these noises there is some public necessity; and the motor cyclist can fairly claim the right to create a reasonable noise in the interests of personal and public safety, not to speak of mechanical factors. If the dummy silencer and open cut-out are killed by the new designs and regulations, more need be expected or hoped for. If there is an exception, it is that a special degree of silence should be enforced in all motor cycle trials. A stream of motor cycles stand in a different category from the passage of a solitary machine. The row created in Scotland and in the West of England by the hold of the two big Six Days' Trials was wholly unjustifiable; nor was it confined to the fringe of scallywags who attend such functions and delight in disgusting all sensible men.

**The Price of Motor Bicycles.**

The sharp lesson administered to the British automobile industry appears to be ignored by the motor cycle industry. A huge invasion of cheap foreign cars designed on simple lines, produced in vast quantities and manufactured by very keen organisation, has hampered the second-hand car market, and has considerably fluttered the manufacturing dove. A similar attack upon our motor cycle industry is only a matter of time, and may or may not incorporate such a depreciation in quality as is characteristic of

Miss Florrie Richards, age sixteen years, said to be the first lady motor cyclist in Nottingham. Miss Richards has been a motor cyclist for two years. Her present mount is a 2½ h.p. Elswick; on this she has ridden as much as 200 miles a day. She is particularly clever in traffic, and often drives her father out in a Sun-Precision and sidecar.

## Occasional Comments.—

car invasion. At the moment there are no signs of our motor cycle industry being forewarned, or forearmed. Efforts to cheapen the motor cycle are confined to a few small firms, turning out machines in small quantities, the economy being apparent rather than real, and being effected solely by avoiding middlemen's commissions, racing expenses, advertising charges, and all that would rank as "establishment charges" in the case of big firms, an item that often absorbs 25% of the list price of a commodity. There are no immediate signs of a motor cycle invasion, but our markets are expanding by leaps and bounds, and some such onslaught is only a matter of time. I appeal to our big and successful firms to consider whether they cannot form plans for protecting themselves by substantial reductions in their prices for 1914. Such a reduction would have very far-reaching effects. It would popularise the hobby, and, as we are near the ideal of possessing a motor cyclist in every household earning more than £3 per week, our position would be much improved. It would build up the national prosperity, and improve the national health, now suffering from the pleasures of artisans being largely confined to watching football matches and attending picture palaces. Manufacturers are justified in charging £50 for a good machine so long

as they can get it; but prices are rising steadily; and few years may elapse before huge batches of American or French or German machines are dumped upon us at £40 or £30 apiece.

A 6 h.p. Matchless and sidecar, used by Mr. J. Van Zwieten in the city of Pretoria and suburbs, for advertising purposes. We are told that the machine was run for long periods at almost walking pace.

## Some Experiences with a Lukin Carburetter.

AS the Douglas which we are now riding is used a great deal in London traffic, and often has to be driven through London parks where a speed in the neighbourhood of twelve miles an hour is to be maintained, a carburetter which would give the greatest amount of flexibility had to be found. The first time the Lukin was put on it achieved the desired result. Easy starting and slow running were obtained with the minimum amount of trouble. There was no need to search for the mixture when it was required to run slowly in tricky places. It was always there, so to speak, no matter to what degree the throttle was opened. The difficulty of adapting the Lukin carburetter was overcome by fitting an extra induction pipe as shown in the illustration, which allows the carburetter to be stowed away neatly behind the mag-

neto. It could not be fitted in the usual way, as owing to the position of the mixture orifice it would have had to have been placed with the float chamber outwards, and would have projected too far. The method of fixing, though neat, is by no means ideal, as the rear cylinder, owing to the acute corner the gas has to turn to reach it, receives its mixture under more or less of a disadvantage. We mention this fact purposely, as notwithstanding this difficulty the carburetter works extremely well, gives ample power and wonderful controllability. Thanks to the latter excellent attribute it renders traffic driving a real pleasure. In fact, we have never traversed congested streets on a motor bicycle with greater comfort than on the Douglas working with the Lukin. The new carburetter was fitted in October, when the mornings were cool and foggy, and the first great fault soon manifested itself. This was freezing, which would cause a complete stoppage in the early part of the day, and would disappear as the temperature became warmer. How this was overcome may be seen by the accompanying illustration. A hot air sleeve was bolted round the vaporising chamber and connected to the exhaust pipe of the front cylinder by a pipe lagged with asbestos string. Since the fitting of this warming device the carburetter has worked perfectly. It gives plenty of power, and is not extravagant. In a word, it has greatly altered the machine for the better. It would undoubtedly give better results still if it could be bolted direct to the induction pipe, doing away with the extra pipe shown. The whole of the fitting was carried out by Messrs. Lukin, Ltd., the Ride, Newcomen Street, S.E. Incidentally, the photograph shows a method of carrying a spare piece of belting in an unused corner, and a home-made mud-shield which is most effective.

The warming pipe from the exhaust fitted to the Lukin carburetter.

# Chain-driven Machines at the Show.

Calthorpe cast aluminium footboard.

Rover compensating link for rear belt rim and sidecar band brakes. The lever is mounted in the usual position.

Torpedo compensated rear brake.

A single aluminium casting which constitutes the Clyno silencer.

B.S.A. combined front stand and mudguard stay.

A striking example of the 86 x 96 mm. three-speed James.

3 h.p. twin-cylinder two-speed Lea-Francis—a new mount for 1913.

Valve side of next year's 2½ h.p. two-speed Sunbeam with oil bath chain cases.

# Tourist Trophy Types.

A T.T. Triumph stripped for racing.

Rover 3 1/2 h.p. T.T. model.

1913 model T.T. Racing Rudge.

L.M.C. new ball head clip, also showing clips for Bowden wires.

Centaur foot board and clutch pedal for Armstrong gear.

L.M.C. rear mudguard swung down.

A useful accessory in the form of an oil squirt is fitted to Bradbury machines and is carried, as shown, on the saddle tube.

## RECORDS AT BROOKLANDS.

G.W.K. Regains Hour Record. A Douglas averages 44 m.p.h. for Six Hours.

**T**UESDAY last week proved a successful day for record aspirants. The weather was fair with a gusty wind, but the track was wet. At 10.13 a.m. J. T. Wood and S. L. Bailey were started by Mr. A. V. Ebbelwhite. The former was driving a G.W.K. with twin-cylinder Coventry-Simplex engine of 86 x 92 mm. = 1,070 c.c., the weight of which all on, including body, was 721 lbs. Wood's task was a difficult one, as he had several miles to add to his previous best hour record, for H. F. S. Morgan had wrested the title of hour record holder by adding seven miles to the G.W.K. record of September 25th. However, the G.W.K. buzzed round the track regularly at a speed not far short of a mile a minute, and Wood was successful in his object, incidentally capturing the fifty miles record on the way. The times and distances were:

1 hour	...	56 mls. 76 yds.	= 56.04 m.p.h.
50 miles	...	53m. 8 $\frac{3}{4}$ s.	= 56.45 m.p.h.

*Previous Best.*

H. F. S. Morgan (Morgan cyclecar), 9/11/12.

1 hour	...	55 mls. 329 yds.	50 miles	...	54m. 39 $\frac{1}{2}$ s.
--------	-----	------------------	----------	-----	--------------------------

S. L. Bailey, riding a Douglas as usual, much longer ride, his object being to annex C (350 c.c.) records up to six hours. The Douglas fine fettlé, though, of course, it was never forced utmost in view of such a long gruelling trial record was characterised by the regular running little twin, as a consideration of the speeds. Every new record actually averaged between 44 $\frac{3}{4}$  m.p.h. Bailey already held the three record, and commenced raking in new records the expiration of four hours, when he improved 10 miles the distance covered by N. D. Slatter 247 c.c. single-cylinder Alcyon over a year ago. 1 of the new records are appended:

4 hours	...	173 mls. 786 yds.	= 43.46 m.p.
5 hours	...	223 mls. 864 yds.	= 44.69 m.p.
6 hours	...	264 mls. 216 yds.	= 44.02 m.p.
200 miles	...	4h. 30m. 22 $\frac{3}{4}$ s.	= 44.78 m.p.
250 miles	...	5h. 43m. 28 $\frac{3}{4}$ s.	= 43.67 m.p.

*Previous Best.*

N. D. Slatter (single-cylinder Alcyon, 62x82). 31/1	
4 hrs. ... 163 mls. 1622 yds.	6 hrs. ... 223 mls. 14
5 hrs. ... 196 mls. 1011 yds.	200 mls. ... 5h. 5m. 1

## A.C.U. Silencer Tests. The Regulations.

**T**HE Auto Cycle Union invites manufacturers of motor cycles and others to submit silencers for the purpose of testing their efficiency in a trial which will be held near London during January next. The committee consists of A.C.U. members and representatives of the Motor Cycle Manufacturers' Union. The judges are Col. H. C. L. Holden, R.A., Mr. J. W. G. Brooker, Dr. A. M. Lowe, D.Sc., Mr. Archibald A. Sharp, B.Sc., and Dr. Wm. Watson, B.Sc.

The method of carrying out these tests has been decided upon by a committee appointed by the A.C.U., and for the purpose preliminary tests were held earlier in the year to determine the "standard" of silence, which was obtained by constructing a special telescopic silencer, details of which have already appeared in these pages.

All silencing devices entered for the competition will be tested against this "standard" silencer, which, it should be noted, is of so simple a form that manufacturers may easily construct duplicates in order to ascertain the degree of quietness, irrespective of efficiency, which the committee consider desirable. It should also be understood that the committee put this design forward merely as an exhaust arrangement that is effective as a silencer, and do not suggest that it is necessary or desirable that motor cycle silencers should be of such large dimensions.

Silencers submitted for the test will be divided into two classes:

A. Silencers that are suitable for attachment to any make of motor cycle.

B. Silencers which are an essential part of the whole design of a particular make of machine.

Silencers in Class A will be tested both on the bench and on Brooklands Track, such combined tests rendering them eligible for a *First Class Certificate*.

In Class B silencers will be tested at Brooklands, and will be eligible for *Certificates of Merit* only.

### Conditions for the Brooklands Trial.

In order to judge the noisiness of the various cycles, they will be ridden by an official of the A at definite speeds, throttle openings, etc., both and without their silencers and exhaust pipes.

Tests will also be made to determine the efficiency on the level and uphill, and for these tests the entrant must supply the driver.

Silencers entered in Class A will be tested fit a standard 3 $\frac{1}{2}$  h.p. Rudge motor bicycle (placed at the disposal of the A.C.U. by Rudge-Whitely Ltd.), and such silencers must be submitted complete with exhaust pipe and all other necessary attachments.

### Conditions for the Bench Tests.

The bench tests entered in Class A will be held at the works of Auto-Carriers, Ltd., Thames Ditton, where a 3 $\frac{1}{2}$  h.p. single-cylinder water-cooled field engine (lent by Blumfield, Ltd.) will be installed and coupled to a fan dynamometer, lent for the tests by White and Poppe, Ltd.

Data will be obtained with the engine running 1,000 and 2,000 r.p.m. respectively with the standard silencer, and compared with similar data obtained with each competing silencer fitted. It will be taken that the engine is run under the conditions throughout the tests. The noise made by the various silencers will be measured by Holden's audiometric apparatus, and the pressure point between the engine and the silencer will be recorded.

In judging the results the following points will be taken into consideration: (a) Degree of noisiness compared with the "standard"; (b) weight of silencer complete, including emission pipe if fitted; (c) volume; (d) general practicality.

Entries close on December 31st, 1912.

**Westmorland M.C.C.**

The annual dinner and presentation of prizes took place on the 7th inst.

**Stockport and District M.C.C.**

The annual dinner of the above club will be held on December 5th, at headquarters, White Lion Hotel, Stockport.

**Newcastle and District M.C.C.**

A supper and smoking concert took place on the 21st inst., and there will be a fault competition on December 5th.

**Foleshill and North Warwickshire M.C.**

The first annual dinner was held on the 19th inst. at the General Wolfe Hotel, followed by the presentation of the prizes won during the year. Mr. S. Bettmann, J.P., the president, promised to present the club with a silver cup.

**Cork and District M.C.C.**

The annual dinner took place on the 26th ult. The prizes competed for during the season were distributed. The dinner was followed by an excellent musical programme to which the club orchestra, under the title of the "Non-skid" and, contributed several pleasing items.

**Penang (Straits Settlements) M.C.C.**

As there are now a large number of motor bicycles in Penang, it has been decided to form a club. Will any motor cyclists willing to join kindly send their names to the hon. secretary, *pro tem.*, Mr. L. W. Learmount, c/o Paterson, Simons and Co., Ltd., Penang?

**Motor Cycling Club.**

On the 19th inst. the Motor Cycling Club held a most successful smoking concert at the Crown Room, Holborn restaurant. The programme was an exceptionally good one. Mr. Charles Jarrott (the president) was in the chair. Visitors from several metropolitan and provincial clubs attended.

**Bristol B. and M.C.**

The thirty-seventh annual general meeting of the above club was held at the headquarters, Full Moon Hotel, on Wednesday, the 13th inst. The meeting was well attended, the chief result being that the motor section was put on a much firmer footing. The following were elected officers for the coming year: President, Mr. E. J. Prosser; Captain, Mr. F. Bevan; hon. sec., Mr. A. S. Richards, 34, Ivor Road, Bishopston, Bristol.

The annual dinner (at which prizes will be presented) will be held at headquarters on December 7th, at 7 p.m.

**Colchester and District M.C.C.**

A club has been formed with the above title. Mr. E. Herdman is captain and Mr. C. L. Gray hon. sec. Headquarters, Red Lion Hotel.

**Cumberland County M.C.C.**

The annual general meeting was held on the 9th inst. The club has had a most successful year, and the membership now totals 130. The following officers were elected: Captain, Mr. E. A. Iredale; joint hon. secs., Messrs. W. B. Little and Hilton Robinson; treasurer, Mr. T. B. Westmorland. A dinner and concert followed the meeting.

**Herts County A. and Ae.C. (Motor Cycle Section).**

The last of the series of four open reliability trials for motor cycles and passenger machines will take place on December 14th. The route will be: St. Albans, Harpenden, Luton, Barton, Sundon, Dunstable, Ivinghoe, Aston Clinton, Aston Hill, Wendover, Prince's Risborough, Missenden, Chessham, Boxmoor, Hemel Hempstead, Water End, Gaddesden, Markyate, Dunstable, Caddington, Harpenden, St. Albans. The trial will consist of non-stop runs over certain sections of the route and two timed hill-climbs, a fast and a slow. The competitor in each class making the best time either fast or slow will set the standard for the hill and gain full marks, the rest will lose one mark for every two seconds variation. Five marks will be deducted for failure on an observed hill. Particulars may be obtained from Mr. G. S. N. Carter, Aplins Close, Harpenden, Herts, to whom entries must be sent on or before December 2nd.

**Aberavon, Port Talbot and District M.C.C.**

On the 16th inst. a novel speed-judging competition was held. The competitors were required to travel twice over a circuitous route of slightly more than twenty miles, and the winners were to be those riders showing the least variation of time for the two trips. Speedometers and watches were not permitted. The weather was fine and the roads in dry condition. The results were as follow:

**SIDECAR CLASS.**

Rider and machine.	Time of		Time of		Variation.
	1st journey.	2nd journey.	1st journey.	2nd journey.	
*E. W. Roderick (6 Zenith)...	1h. 1m.	1h. 1m.	1h. 1m.	1h. 1m.	nil
H. J. Brokensha (6 Entfeld)...	1h. 0m.	1h. 0m.	1h. 1m.	1h. 1m.	1m.
A. Salway (3½ Premier)...	1h. 24m.	1h. 25m.	1h. 25m.	1h. 25m.	1m.

\* Club gold medal.

**SOLO CLASS.**

J. Davies (3½ Zenith) ...	1h. 15m.	1h. 18m.	3m.
---------------------------	----------	----------	-----

Bristol M.C.C. members at Keynsham on the occasion of the last competition of the year.

#### TIME TO LIGHT LAMPS.

Nov. 28th	...	...	4.55 p.m.
" 30th	...	...	4.55 p.m.
Dec. 2nd	...	...	4.52 p.m.
" 4th	...	...	4.51 p.m.

#### Next Thursday.

Next week's issue of this journal will contain critical and commentary articles on the different types of motor cycles exhibited at Olympia, written by well-known experts.

#### Record Breaking in November.

Record breaking has started again in earnest. There are quite a number of aspirants to record fame at Brooklands, new figures at Show time being especially sought after.

#### A Two-stroke Engined Cyclecar.

We hear of a cyclecar being built in the Midlands which is to have a two-stroke twin-cylinder engine. We have awaited with expectancy and not a little interest the advent of such a type of runabout.

#### Meeting of the F.I.M.C. at Olympia.

The Marquis de Mouchilly de St. Mars regrets he was unable to take the chair at the meeting of the delegates of foreign and colonial motor cycle clubs. He has always taken the greatest interest in international competitions, and it is only owing to his being in bad health and having been ordered abroad by his doctor that he was unable to attend.

#### Stolen Machines.

A 1912 free-engine Triumph was stolen from outside the Royal Hotel, Sutton Coldfield, on the 14th inst. The machine number is 193,377, registration number E1605. The oil tank is dented through a collision with a motor car. The back tyre is a Michelin and the front Clincher.

#### Home-made Petrol and Excise Duty.

In the House of Commons on the 19th inst., Mr. Bigland asked the Chancellor of the Exchequer, if the Government would undertake to allow the sale of home-manufactured petrol or petrol substitutes free of excise duty, with a view to securing an adequate supply immune from the liability to capture by an enemy. The Chancellor of the Exchequer said: "The answer is in the negative."

#### Championship Races at Ontario.

The Ontario championship motor cycle races were decided at Toronto before 5,000 spectators on the Toronto dirt track. In the five mile race for private owners riding belt-driven machines, Percy Barnes (3½ h.p. Triumph) was an easy winner in 6m. 25½s. In the sidecar race first, second, and third places were taken by

Fred Hall, A. McHaffrey, and Fred Greenwood, who all rode Triumphs. The winner's time was 8m. 23½s.

#### Auto Cycle Union Notes.

**NEW SCHEME OF CLASSIFICATION FOR COMPETITIONS.**—It was agreed that the adoption of the new scheme of classification should be a condition attached to all permits issued next year, with the exception of six meetings. The six meetings are to be balloted for by the secretaries of the various clubs. It was also agreed that a sub-committee consisting of Messrs. S. W. Carty, E. M. P. Boileau, W. G. McMinnies, J. F. McNab, J. G. Brooker, and Archibald Sharp should meet and draft the new scheme of classification.

**PERMITS.**—A permit has been granted to the Herts County A.C. to hold the fourth of a series of one day reliability trials on Saturday, December 14th, subject to the timekeepers being approved by the A.C.U.

**RECORDS.**—Various claims have been passed and accepted, except one claim by Harry Martin for a half-mile record, which the A.C.U. Competitions Sub-Committee decided was not a recognised distance.

**ENGLISH-DUTCH TRIAL.**—This competition will take place on August 4th, Bank Holiday, as last year. Further details will be published in due course.

**AN UNOFFICIAL TRIAL.**—The A.C.U. has decided to take action with regard to F. Begley's unofficial ride from London to Edinburgh; both the makers of the machine and the rider have been communicated with.

**BRITISH MOTOR CYCLE RACING CLUB.**—The following dates have been fixed for B.M.C.R.C. meetings at Brooklands: March 9th, April 26th, May 17th, June 14th, August 9th, September 13th, and October 11th.

**MEMBERSHIP.**—Two hundred and forty-two members represented the increase in membership of the A.C.U. during the last month.

**AFFILIATION.**—The Bournemouth and District M.C.C. and the Bristol Sports Club (motor cycle members) have become affiliated to the A.C.U.

**CYCLECAR DEFINITION.**—It has definitely been passed as a rule which has received the approval of the R.A.C. Competitions Committee that a cyclecar complete with body shall not exceed 7 cwt. [This announcement is interesting, as we recently pointed out that a cyclecar could have a body of any weight, according to the old rule, provided the chassis weight was less than 6 cwt. —Ed.]

#### SPECIAL FEATURES: OLYMPIA SHOW REPORT

Profusely Illustrated.

#### A TOUR IN SWITZERLAND. REGULATIONS FOR SILENCER TESTS.

**ANNUAL DINNER.**—The annual dinner of the Auto Cycle Union will be held about the second week in January. Further particulars will be published in due course. This year ladies will be invited.

**CANADIAN MOTOR CYCLISTS.**—The Canadian Motor Cyclists' Association, which has entered into an agreement with the Federation of American Motor Cyclists, has also entered into an agreement with the Auto Cycle Union, the idea being to maintain as far as possible the same competition rules, to recognize records in either country, and to extend touring facilities to A.C.U. members in Canada, and to Canadian members travelling in England.

**THE F.I.C.M.**—To-day, the 28th inst., the delegates of the English, Irish, Scottish, and the principal foreign and colonial governing bodies of the motor cycle sport and pastime are being entertained to luncheon at the Royal Automobile Club. A meeting is to take place at Olympia with the object of re-founding the Fédération Internationale des Clubs

Motocyclistes, at which Mr. J. L. Orde, secretary of the R.A.C., in the absence of Mervyn O'Meara, will preside. The delegates will be entertained to tea at Olympia after the meeting.

**THE NEW BADGE.**—Mention was made in the pages last week of the new A.C. badge which at last Monday was available for purchase at 3s. each. Those who possess the old pattern badge may obtain new ones by turning their present badges to the secretary and enclosing six stamps.

**THE L.G.B. CUT-OUT REGULATIONS.**—The draft of the above regulations was duly considered by the Silencer Committee, and it was agreed to recommend the General Committee that no objection be offered.

New A.C.U. badge fitting for top of lamp or front mudguard extension.

**ALLDAYS, No. 106.**

3½ h.p. MODEL: 85 × 88 mm.; m.o.i.v.; Amac; V belt; two-speed hub and free engine.

ALLDAYS AND OXIONS, LTD., Birmingham.—Most models on view are of the 3½ h.p. size, but the new twin is the attraction. In 1903 models a new steering head is adopted, also a new design of spring forks and front stand. Care has been taken in mudguarding both front and back wheels, side flaps being fitted to the guards in both cases. A new guard over the belt rim should be noted, while on the type fitted with two-speed Roc gear a neat aluminium cover over the band brake and clutch is provided. The luggage carrier tool-cases are metal housed. On the two-

Alldays handle-starting mechanism.

speed model the chief points in the power plant are waterproof magneto, placed behind the crank case and driven by chain, and spring plunger drip feed pump. Neat aluminium footboards are well supported at both ends, and on the right-hand side heel and toe pedals are provided for the brake and the low-speed control. On the left side is the high gear pedal held in place when required by a pedal trigger. A hand-starting device enables the engine to be started with the back wheel raised. A new sidecar frame is being adopted. The 8 h.p. twin engine has already been described. This is fitted to the Alldays sidecar machine, and also to the Alldays Midget, a cyclecar which is described elsewhere in this issue. The bore and stroke of the 8 h.p. twin-cylinder engine are 85 × 88 mm.

**B**IGGER, more complete and better arranged than hitherto, the third annual Olympia Show of Motor Cycles and Accessories cannot fail to prove an immense attraction. The doors are open at 10 a.m. each day, and remain open until 10-30 p.m. Admission 1/-. We deal elsewhere with the tendencies of design for 1913, but the outstanding feature of the Show is the large proportion of passenger motor cycles exhibited. This is not only due to the new rule admitting light four-wheelers which come within the definition of cyclecars, for sidecars also have undoubtedly increased in numbers. Even the casual observer must be moved to pay a tribute to the exquisite finish of most of the machines which include the best that British workmanship can produce.

The gallery is packed with ingenious accessories made for greater convenience and to reduce time and trouble. No motor cyclist or prospective rider of a motor cycle should fail to visit the exhibition.

The descriptions of 1913 models in this issue have been written by our own staff, who are all motor cyclists of long experience, after a stand to stand tour of the Show.

**NOTE.**

Our last few issues have contained advance reports of many new models; for detailed descriptions and illustrations of such machines we append the following reference table:

- |          |               |   |
|----------|---------------|---|

**A.J.S., No. 29.**

2¾ h.p. MODEL: 74 × 81 mm.; side by side m.o.i.v.; Amac carburettor, chain transmission; two-speed A.J.S.; countershaft sliding.

A. J. STEVENS AND CO., Retreat Street, Wolverhampton.—This is one of the most successful medium weight machines, which was entered in competitions this

A.J.S. kick starter mechanism, showing how a portion of chain case can be removed to gain access to kick starter, also front and back chains.

year. In this and other A.J.S. models the latest type of waterproof U.H. magneto is fitted. The company has wisely decided to confine its attention to two models only. The chains are entirely enclosed in dust, mud, and waterproof casings.

It is interesting to note that the back wheel, gear box, clutch, sprocket, chains, and kick-starter can all be removed without dismantling the chain cases. The internal expanding brake on the rear wheel is also well worthy of inspection. The clutch has five plates, two of these being provided with cork insets, which allow the drive to be taken up

**The Olympia Show.—**

very sweetly. This model may be had with a three-speed gear at a slight extra cost.

6 h.p. MODEL (twin): 74 × 81 mm.; side by side m.o.i.v.; Amac carburetter; chain transmission; A.J.S. three-speed sliding.

The 6 h.p. A.J.S. sidecar model is one of the most successful passenger machines of the year, and in the main closely resembles the smaller model we have just described. It is fitted with stronger chains and is quite up to the work for which it is intended. All the tappets are held down by springs which keep them pressed against the

Plan view of 6 h.p. 1913 A.J.S.

cams, thus reducing noise. Two of these machines are shown fitted with the new A.J.S. sidecar, the panels of which are of sheet steel, following a practice adopted in motor car building. The back is well padded, and at the rear there is a locker for a spare tyre cover. It will also be noticed that the leg room is ample. An advantage is that the engine, motor cycle, and sidecar are made in one factory.

Ariel T.T. roadster with spring seat pillar. The mudguarding is a good feature of this make.

**ARIEL, No. 91.**

3½ h.p. MODEL: 86.4 × 85 mm.; side by side valves; B. and B. automatic carburetter; belt; Armstrong V. or VI.

COMPONENTS, LTD. (Ariel Dept.), Bournbrook, Birmingham.—The Ariel Co. still retain the detachable tank and lower rail as a standard feature; the tank has rounded corners, petrol sump, and filter. Lubrication is by a semi-automatic drip feed oiler. The frame may be obtained with either dropped tube or straight top rail, both are used in conjunction with the Ariel spring seat-pillar. The front wheel has wide side extensions for its full length and specially made splashers attached to the front wheel stand. The rear guard is fitted with a long wide flap extending to the belt rim and low enough to protect the belt from mud.

The spring forks are made somewhat wider so as to accommodate the new mudguard, and an improved water-tight front hub is fitted. The front brake acts on the rim in the usual way, but the fork carrying the shoes lies outside the guards, and takes its bearing in special lugs brazed to the frame.

Pannier bags are fitted below the level of the carrier, and are enclosed in a sheet steel housing. The Ariel engine remains practically unaltered. It is notable for its simple and effective form of decompressor and the extra width between the valve chests. This model may be obtained with the Ariel free engine and variable gear, also with a fixed engine and a T.T. model. The free engine model is fitted with neat aluminium footboards. All the three-speed models are fitted with a kick-starter.

7 h.p. MODEL (two-cylinder): 85 × 88 mm.; side by side valves; B. and B. carburetter; chain; two-speed counter-shaft gear.

This is quite a new model for 1913, and is made either for solo or sidecar work, sidecar lugs being incorporated in the frame. The engine is a neat piece of work, and drives to a counter-shaft by two chains, and thence by chain to the rear wheel. The gears are engaged by means of expanding clutches, which lock one of two front chains to the counter-shaft. A slipping clutch is fitted

on the engine shaft. The frame has a dropped top tube, and is built on the same lines as the 3½ h.p. frame. Handle starting is fitted to the engine, and very long footboards. The rear brake is of the internal V-type acting on a dummy belt rim. No decompressor is fitted to this model. The company also construct a special sidecar, the chief feature of which is the low chassis position.

**ARNO, No. 43.**

3½ h.p. MODEL: 84 × 89 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; Sturmey-Archer three-speed.

THE ARNO MOTOR CO., LTD., Coventry.—One of the features is the attachment of the engine to the frame. The crank chamber is furnished with two horizontal plates resting on platforms brazed to the down tubes of the frame. The attachment is made by four bolts, upon removing which the whole power unit slides out sidewise. In the T.T. model the ordinary type of silencer gives place to a long rearward tube. The frame is

Arno external exhaust lift and adjustable tappet.

dropped considerably, and careful attention has been paid to making it extremely rigid.

The magneto is gear driven, and is placed behind the cylinder, being located on one of the crank chamber plates to which we have already referred.

The 2½ h.p. 77 × 81 mm. and the 2¼ h.p. 65 × 70 mm. machines conform

**The Olympia Show.—**

to the same specification, but are shown in single-gear form only. Except in the case of the smallest model, all of the Arno machines can be fitted with pedal-

for easy access to the valves. The tank has large filler caps, and the lubrication by Best and Lloyd is semi-automatic. The front mudguard has wide side extensions all the way round. The rear

one nut. All models are fitted with a neat petrol filter.

6 h.p. MODEL: 70 × 80 mm.; side by side valves; Amac carburetter; N.S.U. two-speed; belt.

The 6 h.p. twin-cylinder model is quite new, and is fitted with a Fafnir engine. A chain-driven kick starter is fitted, and in most respects this model resembles the 3½ h.p. The chief alteration lies in the silencer, which fits longitudinally in

Valve side of the 3½ h.p. Arno.

ing gear, which is entirely removable by undoing a couple of bolts, detachment being so arranged that no sign remains of the pedalling gear when it has been removed.

guard is fitted with a protector for the mud thrown from the belt rim, and a tray to protect the working portion of the rear air springs. Band brakes are fitted to both wheels, that at the rear being operated by a pedal and Bowden cable. A new feature shown for the first time this year is the A.S.L. two-speed gear, which is carried in front of the engine and driven from it by a chain enclosed in an aluminium case. Inside the gear box lies a multiple plate clutch, the gears being always in mesh and changed by sliding dogs. This operation is carried out by a double pedal.

The clutch is operated by a Bowden lever and cable on the left handle-bar. From the gear box the transmission is by a single belt of considerable length, and as the driving pulley is geared down considerably, a small rear belt rim is fitted.

The engine may be started by a pedalling gear which is attached to the bottom bracket, and may be removed by undoing

Seat-pillar suspended on an air spring. (A.S.L. stand.)

the frame and has a central air tube for cooling purposes. From the silencer a very large diameter pipe extends to the rear, and is flattened at the end. A guard is fitted over the rear exhaust pipe to protect the rider's leg.

A sidecar suspended entirely on air springs was a late arrival. It should be most comfortable.

The A.S.L. system of spring suspension is an excellent one, and as we wrote last week it is surprising that more motor cycle frames are not sprung.

The A.S.L. air spring suspension applied to the rear portion of a sidecar.

**A.S.L., No. 85.**

3½ h.p. MODEL: 84 × 86 mm.; side by side valves; Amac carburetter; A.S.L., N.S.U., or Sturmey-Archer gear; belt.

AIR SPRINGS, LTD., Stafford. — The chief feature of these machines is, of course, the air spring suspension. For some time past these models have been fitted with 26in. wheels.

A departure for the company is a machine with a rigid rear frame, the saddle and front forks being supported on air springs only. The tank has rounded edges, and a portion cut away

A spring frame A.S.L., with two-speed counter-shaft gear in front of the engine.

**The Olympia Show.—****AUTO-WHEEL, No. 126.**

1 h.p. MODEL: 54 × 54 mm.; a.o.i.v.;  
Wall carburetter; chain; single  
gear.

THE INTERNATIONAL AUTO-WHEEL CO.,  
Russell Garage, Russell Road, W.—This  
attachment was very fully dealt with on  
page 1337 in our issue of November 21st,  
so it needs no more than a passing refer-  
ence. The stand contains many examples  
of this ingenious device, which are shown  
separately and also attached to pedal  
cycles.

**BAT, No. 97.**

5.6 h.p. MODEL (twin-cylinder): 76 ×  
85 mm.; side by side valves; Amac  
carburetter; chain; Bat two-speed.

THE BAT MOTOR MFG. CO., Penge,  
London, S.E.—The well-known Bat  
rear springing is retained without altera-  
tion, the chief change being in the rear

gear box. The 8 h.p. model has a bore  
and stroke of 85 × 85 mm., and is an  
exact duplicate of the 5.6 h.p. in other  
respects. It was described on page 1334  
of the last issue. A similar machine is  
constructed for fast touring, the chain

The Bradbury gear control lever has a universal movement.

drive being replaced by a belt, with  
three-speed hub gear. The magneto lies  
in front of the engine, and is driven by  
chain, and the Bat spring forks are  
used, but not a spring frame. The tank  
is torpedo-shaped. Pump lubrication  
only is relied on. All models are provided  
with wide and serviceable side exten-  
sions to the front guards, and front  
wheel stands are fitted throughout. The  
carrier is made of flat strip steel, and  
supports a single large toolbox at the  
rear, the top of which lies flush with the  
top. The control for the Armstrong  
gear is somewhat unusual, in that it lies  
on the right-hand side of the machine  
and is carried across the frame by a rod  
passing through the bottom bracket.

5.6 h.p. MODEL (twin-cylinder): 75 ×  
65 mm.; overhead valves; J.A.P.  
automatic carburetter; belt; fixed  
gear.

This is a T.T. model, and is con-  
structed on semi-racing lines through-  
out. It will be noted that a short stroke  
overhead valve engine is used, in com-  
bination with an automatic carburetter.  
Small silencers are fitted at the  
end of each exhaust pipe. This model  
is very tastefully finished for the Show,  
having the exhaust pipes, etc., copper-  
plated. All the Bat models are beauti-  
fully finished in black or French grey.

**BRADBURY, No. 113.**

3½ h.p. MODEL: 89 × 89 mm.; side by  
side m.o.; B. and B. carburetter;  
engine-shaft and counter-shaft two-  
speed; belt, belt and chain, or all  
chain.

BRADBURY AND CO., LTD., Oldham,  
Lancashire.—The Bradbury 1913 models  
were dealt with in *The Motor Cycle* of  
November 14th (page 1319), and as the  
belt-driven machine is already so well-  
known, we devote this report to the  
combined drive and the all chain-  
driven machine. Both are fitted with the  
Bradbury two-speed counter-shaft gear,  
and in both cases great care has been  
taken to protect the transmission with  
sheet steel guards. Taking the chain-  
driven model first, one of these is shown  
with standard pattern sidecar, for which  
work it has been specially designed, the  
sidecar attachment lugs are brazed to  
the frame, and specially strong tubing  
is used in the frame construction.

Toper plant of the 2-speed chain and belt drive  
Bradbury, showing clutch control and kick-  
starter.

In the engine the cylinder has been re-  
designed, giving large valve pockets and  
adjustable valve tappets, while the kick  
starter has also been entirely redesigned,  
and is now enclosed in an extension of  
the counter-shaft gear box. The cone clutch  
is now worked by pedal. The gears are  
changed by lever on the top tube. For  
chain adjustment the gear box is slid  
along the stays. A new method is  
adopted for hardening the gear wheels.  
Four patterns of sidecar are on view,

Bat 8 h.p. back wheel, showing both brakes.

brakes. These act on a single drum,  
one internal expanding, the other external  
contracting. The rods are connected  
to the bands by a special spring clip,  
rendering the rear wheel easier to take  
out. The tank is large and fitted with  
spring filler caps. A short chain trans-  
mits the engine power to the gear box,  
which is of the sliding type, an ex-  
panding clutch, the faces of which are  
slightly coned, being used. Thence an-  
other chain drives the rear wheel. A kick  
starter is fixed to the right chain stay,  
power being transmitted by chain to the

Valve side of the 6 h.p. three-speed belt driven Bat.

8 h.p. chain driven two-speed Bat-Jap.

**The Olympia Show.—**

including one coach-built. This is the product of the firm's own Baby Carriage Department, in which they have had much experience with this class of work. Before leaving the machine, special mention should be made of the design of the left foot rest, which affords an additional security attachment for the sidecar frame. The circular dished cover for the clutch is now hinged, and by undoing a single screw the clutch is accessible. On the sidecar the combined sprag and stand is pivoted on the axle, and by means of a lever can be operated by either driver or passenger. The sidecar frame is extended rearwards to form a luggage platform. The combined belt and chain-driven model may best be described as a modification of the chain model, but it is noteworthy that the gearing down of the counter-shaft admits of a comparatively small rear belt rim and a large counter-shaft belt pulley. The very special provision for protecting the belts has already been illustrated in our pages. A new kick starter of the free wheel chain-driven type and totally enclosed is incorporated in the open drive belt model.

**BRAMBLE, No. 41.**

BRAMBLE MFG. Co., London Road, Coventry.—Five types of Bramble sidecars, with various patterns of bodies. The most interesting feature is a quickly detachable joint which consists of a circular slotted end, the slot being cut on a spindle formed with the portion attached to the bicycle frame. Inside

Bramble sidecar chassis, which has a slightly dropped frame.

it is a circular slotted disc provided with a lever which allows it to be turned round. Another feature on this stand is a sidecar provided with a detachable wheel. This wheel is carried in a pair of forks slotted at the rear end. When the spindle nuts are loosened they allow the wheel to be removed in its entirety.

Example of a Bramble sidecar body.

An entirely new model Brown. The engine is a  $3\frac{1}{2}$  h.p. twin-cylinder.

A stand is fitted to the fork in which the wheel runs; this is similar to those used with motor cycles.

**BROUGH, No. 36.**

$3\frac{1}{2}$  h.p. MODEL:  $85 \times 88$  mm.; side by side m.o.i.v.; Senspray carburetter; single gear; belt.

BROUGH MOTORS, Nottingham.—This is a well-designed machine built on absolutely standard lines. A feature is the wide petrol tank, which carries an ample supply of spirit. A similar model is shown fitted with an Armstrong three-speed gear.

no curved tubes used in the frame. The back mudguard is extended to prevent mud being thrown up by the belt rim, and, in company with other models shown, is provided with a handle starter and three-speed gear. There are also shown on this stand two sidecars, one fitted with a tradesman's carrier, and the other with a handsome touring body with side door and adjustable wind screen.

**BROWN, No. 144.**

$3\frac{1}{2}$  h.p. MODEL (twin):  $63 \times 80$  mm.; overhead valves; semi-automatic carburetter, two jets; Armstrong gear.

BROWN BROS., LTD., Great Eastern Street, E.C.—A new model twin-cylinder medium weight of  $3\frac{1}{2}$  h.p. The cylinders are set at  $60^\circ$ , and the valves are of the overhead type, the seating being in the domes, so that the whole valve can be removed for regrinding. The exhaust pipes are driven tightly into holes in the cylinders and secured by a grub screw. Each jet of the two-jet carburetter is adjacent to the inlet pipe which it serves. The tank holds  $1\frac{1}{2}$  gallons of petrol, and ignition is by Bosch magneto. Footrests as well as pedals are provided. The gear is the No. 7 three-speed Armstrong, which allows the engine to be started with rear wheel on the ground. The mud-guarding has been well looked after, that of the front wheel being particularly good, while the back guard has an extension to catch any mud thrown off the belt rim. The handle-bars are wide, and have the ends dropped, allowing a comfortable riding position. A Brown petrol

6 h.p. MODEL (twin-cylinder):  $77 \times 88$  mm.; side by side m.o.i.v.; Senspray carburetter; single gear; belt.

The Brough machines were fully described on page 1309 of our issue of November 14th, so that only a brief reference is necessary. On the T.T. model a single gear is provided, no silencer but a long exhaust pipe, whilst in the touring model an Armstrong three-speed gear and standard silencer are supplied. This is a type on which Geo. Brough has been so successful in various competitions during the 1912 season.

Lady's MODEL:  $85 \times 88$  mm.; side by side m.o.i.v.; B. and B. carburetter; Armstrong three-speed gear; belt.

The lady's model is an excellent piece of work, and it is interesting to note that the top tube is duplex, and there are

Improved design spring fork on the Brown. Note the long bearing and reinforced head.

**The Olympia Show.—**

filter with three-way cock is fitted, also handle-bar control to the magneto. The exhaust pipes are long and gracefully curved, terminating in an expansion chamber of slightly larger diameter than the exhaust pipe, and drilled with numerous small holes. The spring fork design has been improved, and the machine is beautifully finished.

$3\frac{1}{2}$  h.p. B. MODEL: 86 × 86 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; three-speed Armstrong or two-speed Bowden counter-shaft gear.

The  $3\frac{1}{2}$  B model, like the  $3\frac{1}{4}$  B, has dropped top tube, which is a new feature of the Brown motor bicycles. It is fitted with Bowden two-speed gear and kick starter. It has not undergone any other alterations

Showing neat bend of exhaust pipes and expansion chamber at the end, on the new  $3\frac{1}{2}$  h.p. Brown twin.

**B.S.A., No. 50.**

$3\frac{1}{2}$  h.p. MODEL: 85 × 88 mm.; side by side m.o.i.v.; B.S.A. carburetter; chain; counter-shaft two-speed.

BIRMINGHAM SMALL ARMS CO., LTD., Small Heath, Birmingham.—It is quite safe to say that on no stand do the motor cycles exhibited show a higher standard of workmanship and finish than those exhibited by the B.S.A. Co. The most interesting machine is naturally the newest type, in which entirely enclosed chain transmission is used in conjunction with the B.S.A. two-speed hub. The change is effected by a rocking pedal placed adjacent to the left footboard. The cylinder is offset, and the widening of the fins so as to give the largest possible radiating surface to the head is very noticeable. The B.S.A. carburetter, which was described in our pages recently, is designed to give a straight through induction at all speeds. A kick starter is very neatly arranged on the off side of the machine, and is adapted to the bracket which supports the counter-shaft of the chain transmis-

sion. A semi-automatic lubricator is fitted, whilst the spring forks are of the well-known B.S.A. type. The silencer is

On the T.T. B.S.A. a secondary exhaust pipe conducts the gases to the rear of the engine.

in front of the engine immediately behind the chain-driven magneto. An exhaust pipe lead to the extreme rear of the machine ensures quietness of running. Other models which are shown on this comprehensive stand have all the same sized engine, and comprise a T.T. type with single gear and belt drive, a tourist type with single gear and free engine, a

B.S.A. spring drive mechanism fitted on the engine-shaft.

belt-driven two-speeder with the B.S.A. hub gear, and a model which the firm have named "All English Type."

These machines have been very successful in nearly all the open and other events in which they have been ridden during the past season.

**CALCOTT, No. 51.**

$2\frac{1}{2}$  h.p. MODEL: 70 × 76 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; Armstrong three-speed.

CALCOTT BROS., LTD.—The  $2\frac{1}{2}$  h.p. fixed gear model is shown in addition to the above, also as a T.T. model. The engine is specially characterised by compactness. The magneto is placed immediately behind the cylinder, where it is driven by an enclosed train of gear wheels. Immediately behind and at the side of the magneto is the carburetter. The cylinder is pronouncedly off-set to the crankshaft a valuable point in a small-sized engine that is required to pull hard. The silencer is of aluminium and the use of a copper-plated exhaust pipe gives this part of the power unit a very natty appearance.

In order to allow the use of straight levers on the foot brake and gear control neat rocking shafts are arranged. A feature of the machine is the design of the bottom bracket, which carries a pedalling gear and is extended forwards and outwards to support the engine. The T.T. model has adjustable footrests in the place of pedalling gear, but the latter can be substituted for them immediately if desired. It has also a long plain exhaust pipe with a flattened end in place of a silencer. Druid forks are used throughout, and an ordinary hand lubricating pump is employed.

**CANOULET, No. 125.**

MEAD AND DEAKIN, Ladypool Road, Sparkbrook, Birmingham.—Undoubtedly the sidecar that will attract most attention on this stand is the luxurious coach-built torpedo-bodied conveyance complete with wind screen, Cape cart hood, and side curtains. A substantial luggage grid that hinges down from the curved up back members of the frame. An additional tubular strut has been introduced with the result that the structure is now triangulated to afford very much greater strength. Notable among the other bodies is a deep torpedo open touring body with rolled and upholstered side arms, and another fitted with a torpedo apron giving very complete protection for an open body. An important point in the Canolet design is that the front connections are carried across both the longitudinal frame members, so that were one joint to go the other would still be available.

Valve side of B.S.A. two-speed chain-driven machine.

Centaur 3 1/2 h.p. three-speed model, with kick starter.

**The Olympia Show.—****CALTHORPE, No. 23.**

2½ h.p. MODEL: 75 × 85 mm.; m.o.i.v.; side by side; Amac carburetter; belt; Armstrong three-speed gear.

MINSTREL AND REA, Barn Street, Birmingham.—This is a very serviceable

6 h.p. MODEL (twin-cylinder): 75 × 85 mm.; side by side m.o.i.v.; Amac carburetter; belt; Calthorpe two-speed.

This is another sidecar model, which, except with regard to the engine, possesses the same features as the two foregoing machines.

T.T. Calthorpe with overhead valve engine. This machine has wood rims.

lightweight, and in company with all other Calthorpe models it is fitted with pump fed drip feed lubrication. Pedals are provided for starting on this model, but all others are without pedals.

3¾ h.p. T.T. MODEL: 85 × 88 mm.; overhead valves; Amac carburetter; belt; single gear.

This model is fitted with wide handlebars, ordinary saddle, and fixed gear. Footrests instead of footboards are provided, but in all the other models except this and the 2½ h.p., comfortable footboards are supplied.

4½ h.p. MODEL: 90 × 95 mm.; side by side m.o.i.v.; Amac carburetter; chain and belt; Calthorpe two-speed counter-shaft gear.

This machine is especially designed for sidecar work, and the sidecar to which it is attached is provided with a tradesman's delivery body. The chassis also takes a touring passenger body if desired.

3½ h.p. MODEL: Green-Precision engine, 85 × 88 mm.; side by side m.o.i.v.; Amac carburetter; chain and belt; D.H.K. three-speed gear.

This model has a water-cooled Green-Precision engine and a kick starter. In the case of the D.H.K. gear, the change is effected by means of dog clutches. The plate clutch is carried on the counter-shaft. All models are provided with efficient side shields to the front mudguards, spring-up back stands, and front wheel stands.

**CENTAUR, No. 89.**

3½ h.p. MODEL (single-cylinder): 84 × 86 mm.; side by side valves; Amac carburetter; belt; Armstrong VI.

THE CENTAUR CO., LTD., Coventry.—The new Centaur model may be distinguished by square cylinder radiating ribs. In most respects, however, they are similar to last year's model. The

tank is circular and lubrication is by an enclosed pump. Neat rubber-covered footboards are fitted as standard.

The Armstrong mark VI. hub gear is used. A neat kick-starter is fitted on the off side, consisting of a pedal, which drives the rear hub clutch by a short length of chain. The magneto is gear-driven, and lies behind the engine well out of the way of mud and water. The gear is operated by a single pedal, but the clutch may be held out by means of a spring catch. The rear rim brake is interesting in that the shoe is of unusual length; it operates inside the V of a dummy belt rim. The shoe is pivoted so that the full length of the shoe accommodates itself to the radius of the rim.

The front mudguard has side wings extending its full length, and the rear guard is hinged and has a neat belt protector attached to it. The carrier is

2½ h.p. Centaur power plant. The radiating flanges are of square shape.

of ample dimensions, and supports pannier toolbags, which do not interfere with the luggage accommodation. The spring forks are of the Druid type made under licence. A large expansion box is fitted across the frame in front of the engine, which renders the exhaust extremely quiet.

6 h.p. Wulfruna, with counter-shaft gear and chain drive.

Twin-cylinder two-speed Calthorpe, with belt and chain drive.

**The Olympia Show.—**

2½ h.p. MODEL (V twin): 60 × 60 mm.; side by side valves; Amac carburetter; belt; Armstrong V.

This model is similar in most respects to the 3½ h.p.; the silencer, however, is fitted with an internal baffle plate and has no emission pipe, and the side flaps of the front guard extend to the fork only. The foot brake also is of the usual pull-on type and shoe is not pivoted. Pedalling gear is fitted chiefly for the purpose of starting the engine, which can be done with the rear wheel on the ground.

2 h.p. MODEL (single-cylinder): 60 × 70 mm.; side by side valves; Amac carburetter; belt.

This model is practically a single-cylinder replica of the 2½ h.p. just described, with the exception of the fact that no change-speed mechanism is fitted. All Centaur models have off-set cylinders.

**CHATER-LEA, No. 78.**

8 h.p. MODEL: Side by side valves; Amac carburetter; chain; Chater-Lea three-speed counter-shaft.

CHATER-LEA, LTD., Golden Lane, E.C.—Several examples of the popular No. 7 sidecar model are exhibited. The magneto is now fitted behind the engine. The three-speed gear box, which incorporates a multiple disc clutch and chain drive, remains as before. The tank is capable of containing two and a half gallons of petrol and half a gallon of oil. The sidecar has a dropped loop frame with trussed side members and a coachbuilt body.

3½ h.p. MODEL: 70 × 64½ mm.; side by side valves; chain and belt; Sturmey-Archer three-speed gear.

This is quite a new model, and a very interesting machine. The engine is a twin J.A.P. The drive is by chain to the counter-shaft, where a spring wheel offsets the harshness of the chain, thence to the back wheel by belt with 8in. diameter pulley. The foot starter engages with the counter-shaft. The

Neots lubricator is fitted. Side wings are fitted to both mudguards. This model is known as the No. 10.

**CLYNO, No. 122.**

5-6 h.p. MODEL: 76 × 82 mm.; m.o. side by side; B. and B. carburetter; chain; three-speed counter-shaft.

CLYNO ENG. Co., Wolverhampton.—Various examples of the Clyno, with and

for special remark. The sidecar lugs are brazed to the frame. The Clyno is essentially a sidecar machine, and in this connection it is instructive to note that the sidecar frame has been strengthened by the introduction of a diagonal tubular strut at the front of the frame, where it connects to the motor cycle.

**COMFY, No. 114.**

COMFY SIDECAR Co., High Road, Leytonstone.—The sidecars on this stand

Parts of Clyno multiple-disc clutch.

without sidecars, are exhibited. For 1913 this excellent passenger motor cycle has been entirely redesigned, and it would be a difficult matter to criticise any portion. The kick starter is now on the right hand side, whilst the frame has been modified to give a larger tank and yet a lower riding position. The silencer is made of aluminium. The waterproof type magneto is handle-bar controlled, and the carburetter is automatic and controlled by one lever placed above the throttle lever. The lubrication arrangements also have been modified, so as to feed the oil automatically by pressure through a sight feed adjustable oiler on the top of the tank. The chain cases are made so as to constitute an oil bath for the Renold roller chains from engine to gear box and gear box to back wheel. As the magneto, which is placed on the bracket above the gear box, is chain driven, provision is made for adjustment by securing it with bolts through slotted holes, and the same principle is applied to the gear box. The gear ratios are now 4½, 8½, and 14½ to 1. 26in. × 2½in. tyres are fitted, and special care has been given to render both quickly detachable. Strong stands are provided for both wheels, the patent adjustable stand of the back wheel calling

comprise two designs of chassis. In one the axle is reinforced by a dropped tube that enables the body to be swung lower, as the back stay to the seat-pillar can then be carried in a straight line from the lower member. With the addition of a light grid arrangement accommodation is afforded for a spare petrol can or luggage. At the outer end of the axle, too, the down tube to the lower member is used to accommodate a patent stand, which slides in it, and on being let down by the release of a catch, automatically locks itself with the lifting of the sidecar wheel. Various types of body are fitted to this sidecar, but to suit the torpedo type of body the frame is made with a dropped front member.

Chater-Lea No. 7 model, showing combination of engine, magneto, gear box and clutch with operating mechanism.

(1) Chater-Lea patent sidecar stand. The hinge is kept in open or closed position by the coil spring.  
(2) New design of fork sidecar stand fitted to the Chater-Lea No. 7 model. The connecting links are fitted with ball-bearings.

Valve tappet adjustment plates on the Service Co.'s stand.

Cast rear chain guard.

## The Olympia Show.—

**CONNAUGHT, No. 17.**

3 h.p. MODEL: 292 c.c.; two-stroke; Amac carburetter; belt transmission.

BORDESLEY ENGINEERING Co., Birmingham.—This is an interesting little machine, which is shown on the Service Company's stand, in that the lubrication is effected in a peculiar manner. To the present model there is no lubricating oil pump but a small measure screwed on to the oil tap union which is filled with oil and poured into the petrol tank. Beyond a charge of oil in the crank case, the lubrication is effected through the lubricant being mixed with the spirit—a system which we are led to believe is entirely satisfactory. The gas is drawn in from the front of the cylinder, and on entering the engine it cools the outgoing exhaust charge. There is, of course, a partition between the inlet and exit ports. The transfer port is cast at the rear of the cylinder. The machine is neatly designed throughout, and is illustrated on another page.

Spring filler caps on the Corah tank. A.A. spring points.

**CORAH, No. 25.**

3 h.p. MODEL: 60 x 76 mm.; m.o.i.v.; B. and B. carburetter; belt; single gear.

CORAH MOTOR MANUFACTURING Co., King's Norton, Worcester.—At the time our report was made only one model was to be seen on this stand, specification as given above. The machine is fitted with a somewhat novel built-up lamp bracket attached to the sprung portion of the frame, thus possessing the advantage of being insulated from road shocks. Comfortable footboards are fitted, and the peculiarity of the frame construction is that an additional stay runs from the rear fork ends to the lower portion of the crank case. The hubs and handle bars are finished in black. The sidecar is fitted with a canoe-shaped body with a spacious locker behind. The sidecar wheel is sprung, and the wheel runs on ball bearings of the cage type. A 6 h.p. machine was expected.

**DAY-LEEDS, No. 95.**

3½ h.p. MODEL: 85 x 88 mm.; overhead inlet; carburetter to order; Bowden counter-shaft two-speed belt.

JOB DAY AND SONS, LTD., Ellerby Lane, Leeds.—This is the first time the Day-Leeds motor cycle has been exhibited at Olympia. The engine has several features well worthy of note. The decompressor is particularly simple and is brought into action by the motion of a special rocker. The exhaust valve lifter is neat, the valve being raised by a cam. The inlet valve lies over the exhaust, and may be very

readily detached complete with its pocket. This is done by simply unscrewing a locking ring and removing the unit. Both valve tappets are adjustable, and the inlet tappet has an additional guide cast with the inlet pipe.

The magneto is gear-driven and behind the engine. The frame is of the standard dropped-tube type, and the tank has neatly rounded edges; it is supported by lugs fixed to the lower rail. The lubrication is by semi-automatic drip, and the oil pipe leads to a groove surrounding the baffle plate in the crank case. Thus the piston dips directly in the fresh oil, and the surplus is splashed to the base chamber. This method ensures perfect lubrication to the most important part, i.e., the piston. The machine may also be obtained either with fixed gear or Villiers free engine. Side flaps extending to the front forks are arranged on the front guard, and both front and rear wheel stands are fitted. The handle-bars are finished all black. Druid forks are fitted, and a particularly stout carrier with pannier tool bags.

An important item on this machine is the finger-adjustable pulley, which is of very stout construction and extremely simple in its action.

A special sidecar chassis is shown, which is extremely low and especially strengthened at the important points.

**DOUGLAS, No. 104.**

2½ h.p. MODEL: 60.5 x 60 mm.; m.o. inclined; combined chain and belt; counter-shaft two-speed gear.

DOUGLAS BROS., LTD., Kingswood, Bristol.—All Douglas 1913 machines, of course, embody the 2½ h.p. horizontally-opposed engine, and the combined chain and belt counter-shaft drive which the firm have rendered so famous. We dealt at such length with these models in our

The tank supports and bracket for gear control are brazed to the top tube on the 1913 Douglas.

issue of the 14th inst. (pages 1296b and 1297) that it only remains to recapitulate a few of the more salient features. Apart from the modification in the valve design affording an easier flow of gas, and the adoption of the enclosed Bosch magneto, the improved lubrication is one of the more essential new features. Oil is supplied through a Best and Lloyd pump by a spring-forced plunger, the feed of which is regulated by an adjustable needle valve.

One feature of the Douglas machine which at once strikes the eye is the fact that while the chain from engine to counter-shaft is carried on the left the drive from counter-shaft to back wheel is

taken on the right hand side of the gear box. The several patterns exhibited include a single-gear light touring model with free engine clutch and foot boards, a light touring model without clutch and with two speeds and foot-rests, while still another is the full roadster, the lines of which are, in general, followed on the ladies' model S, but this has, of course, an open frame. The saddle position is unusually low, thus the machine is suitable not only for ladies but for short or elderly men.

The mudguarding has been specially studied. The operating rod for the two-speed gear now runs through the wide tank on the men's model. The great successes of the Douglas machines during the last year or two have so focussed public attention on them that we need not dilate too much on the details of the machines, which, however, deserve most careful study and attention from every motor cyclist.

**DUNHILL, No. 42.**

ALFRED DUNHILL, LTD., Euston Road, N.W.—Several sidecars are exhibited fitted with various bodies, from the inexpensive but comfortable wicker body to the more expensive type of coachbuilt body with torpedo top. A novel form of body with an extra seat at the side for a child was described in our last issue. An interesting type of sidecar is one fitted with a sort of tulip body—quite an unconventional design. One sidecar is fitted with a nickel-plated chassis. Dunhills, Ltd., also exhibit the Regal-Green motor bicycle on which Garrett recently succeeded in making some new sidecar records.

**EDMUND, No. 102.**

3½ h.p. MODEL (single-cylinder): 85 x 85 mm.; side by side valves; B. and B. carburetter; chain and belt; Albion two-speed counter-shaft.

CHARLES EDMUND AND Co., Chester.—The chief feature of this bicycle is its spring frame. The saddle member is pivoted at the steering head and supported at the rear end of the carrier by an arrangement of laminated leaf springs, a quarter elliptic spring being supported at each side of the carrier and shackled to another leaf spring, which is pivoted to an extension of the rear fork ends. This feature is a clever attempt to overcome the frame springing difficulty. In other respects the machine follows standard lines. The front mudguard has side flaps extending as high as the forks. A cast aluminium silencer is fitted at the front of the engine and below the magneto, the latter being chain-driven.

Three other models are shown, one fitted with the new 5-6 h.p. twin Fafnir, which has belt drive to an Albion hub two-speed. A 4 h.p. single-cylinder Fafnir with belt drive to an Albion hub clutch and a 4 h.p. single-cylinder J.A.P. with a fixed belt drive.

An unusual fitment is that of the new Albion two-speed revolving counter-shaft gear, with which we intend to deal in detail at a later date.

Briefly described, the gear is mounted on a bracket just above the bottom bracket of the frame. The whole gear revolves, and it is fitted with a neat kick-starter. It is chain-driven from the

**The Olympia Show.—**

engine-shaft, a simple chain adjustment being fitted. On the outside of the gear shell is a large adjustable pulley from which the drive is taken to the rear wheel by belt. Another model is shown

stroke of 70 x 76 mm. In other respects these models are similar throughout, the frame of the 2½ h.p. being constructed specially light. A neat sidecar is shown, having an outside bearing for the wheel, and a particularly good mudguard, which

front wheel stand is fitted, and the front mudguard has mud flaps extending for its full length; it is also fitted with a splash guard of large dimensions at its lower end. The rear mudguard also has side flaps, which extend from the seat

3 h.p. two-speed Enfield, with new design engine.

Edmund spring-frame mount, with Albion revolving counter-shaft gear.

similar in all respects, with the exception of the engine, which is a 3½ h.p. twin-cylinder, having a bore and stroke of 60 x 76 mm.

**ELSWICK, No. 84.**

3½ h.p. MODEL (single-cylinder): 85 x 88 mm.; side by side valves; B. and B. carburetter; belt; Armstrong three-speed gear.

ELSWICK MFG. Co., Barton-on-Humber. —This machine follows standard lines throughout. It is fitted with a dropped tube frame and a tank of large capacity. The filler caps are of the snap type, and have gauze strainers inside. Lubrication is by semi-automatic sight feed lubricator. The front mudguard is fitted with side extensions. The rear guard has wide extension pieces covering the belt and brake rims. A front wheel stand is fitted and the rear brake shoe is compensated so that it grips with its entire surface at once. Pannier toolbags are protected on three sides by steel covers. All models are finished in a neat shade of green with black and gold lines. The machine has a pleasing appearance, and is fitted with a guard enclosing the front end of the belt and driving pulley.

The 4½ h.p. has a bore and stroke of 89 x 95 mm., and the 2½ h.p. a bore and

has deep side flaps on each side and a tubular luggage carrier behind.

**ENFIELD, No. 101.**

6 h.p. MODEL (twin-cylinder): 76 x 85 mm.; side by side valves; Amac carburetter; chain; Enfield counter-shaft two-speed gear.

THE ENFIELD CYCLE CO., LTD., Redditch, Worcestershire. —The 6 h.p. Enfield remains practically unaltered. The well-known and reliable Enfield two-speed gear is retained.

The tank is of unusual capacity, and the lubrication is by sight feed drip, an auxiliary hand pump being fitted. The control for the change-speed is by handle placed on the tank. Long footboards are fitted, and the brake pedal is in a convenient position; it acts on a dummy belt rim, the shoe and actuating mechanism being particularly powerful.

The engine is started by means of a handle-starting device fitted on the seat tube. A large silencer is placed underneath the footboard which has a pipe reaching to the back of the rear wheel. A

stays to the back stays. The carrier is particularly strong, and may be detached with the rear portion of the mudguard to facilitate tyre repairs. The pannier

Foot starter mechanism of the Enfield lightweight.

toolbags are protected from mud by steel sheaths. The Enfield sidecar and attachment are essentially the same as before, but a strong luggage carrier has been fitted. Points worthy of special observation on the Enfields are the sidecar frame and springing.

Simple but efficient belt guard on the Elswick

3½ h.p. Elswick, fitted with Armstrong three-speed gear and B. & B. single lever carburetter.

**The Olympia Show.—**

3 h.p. MODEL (twin-cylinder): 60 x 75 mm.; overhead inlet valves; Amac carburetter; chain; Enfield two-speed.

The 3 h.p. is a new model, and was described in a recent issue of this journal. The engine is a striking piece of work. The method of attaching the cylinders

New model open frame Enfield with 3 h.p. twin-cylinder engine.

is unusual, and it is only necessary to undo three nuts, when both cylinders can be removed. This is effected by three small clamps, which grip a flange on the base of the cylinder. A neat kick-starter is attached to the 2 to 1 gear. A mechanical oil pump is fitted on the timing gear side. This forces oil through the crank pin and big ends, whence it is splashed to the pistons and remaining bearings. A large glass oil reservoir, through which the oil is pumped, is fitted behind the seat-pillar. As in the case of the 6 h.p. model, the front chains are entirely enclosed, and the rear chain is protected on the upper side. Footboards are fitted, and the Enfield V. handle-bars with controls brazed on, which have become a feature of these machines.

This model is also shown constructed as a lady's machine, with a sloping front bar. The petrol tank is provided with a large glass topped filler cap, which acts also as a petrol gauge. Simple and neat dressguards are fitted round the tank, extending below it. These are hinged to the upper edge of the tank and held in position by simple clips. Thus the engine is readily accessible, although the shields afford ample protection for a lady's skirt.

2½ h.p. MODEL (twin-cylinder): 54 x 75 mm.; side by side valves; Amac carburetter; chain: Enfield two-speed

The 2½ h.p. Enfield is too well known to require lengthy description, and has undergone no important alterations with the exception of the fitting of a kick-starter. This is carried on the front down tube and connected to the crankshaft by means of a chain. The Enfield "cush" drive is fitted to all models; this consists of a drum divided into three compartments, in which lie six rubber blocks; between each pair of blocks is a flange attached to a plate on which is carried the driven sprocket. All the Enfields are beautifully finished.

**EXCELSIOR, No. 98.**

4½ h.p. MODEL (single-cylinder): 86 x 112 mm.; side by side valves; Binks automatic carburetter; G.H. two-speed or S.A. three-speed; belt or chain.

BAYLISS, THOMAS, AND CO., LTD., Coventry.—The 4½ h.p. model is chiefly made for sidecar work. The engine, except

for its bore and stroke, is typical of all the firm's productions, and consequently a description of this one model will suffice. The chief improvements on the Excelsior are re-designed timing gear, which runs on ball bearings, and a particularly neat and simple decompressor, which was described and illustrated in our issue of the 21st, page 1336.

Adjustable valve stems are fitted instead of adjustable tappets. The magneto is carried high up behind the engine.

Excelsior oiling system, which feeds the gudgeon pin at the bottom of the stroke, the surplus oil being conducted to the main bearing.

The frame has a dropped top tube, and there are side extensions to the front mudguard and a particularly wide rear mudguard, the rear portion of which is detachable. The silencer has been considerably increased in size. Its construction is unusual, in that the tubular portion is carried in the engine plates and extends on each side, this forming a neat unit. Druid spring forks are fitted, and a metal protected toolbag which lies flush with the rear of the carrier.

The control for the Sturmey-Archer gear is brazed to the top tube, and if the G.H. gear be fitted, both chains are neatly protected from mud. The gear

box is bolted to the bottom bracket, and slides to adjust the chains. The tank has rounded edges, and is supported by lugs from underneath. Lubrication is by semi-automatic drip, and a petrol filter is combined with the petrol tap.

The 5-6 h.p. model is similar to this in all respects, but the engine has bore and stroke of 96 x 112 mm., and the Armstrong Mark VI. gear replaces the Sturmey-Archer; 2½ in. tyres are fitted to both these models.

The 3½ h.p. engine has a bore and stroke of 80 x 88 mm., and can be supplied with Sturmey-Archer three-speed, Villiers free engine, or fixed gear. All models are fitted with Coolguard trouser protectors, which consist of a coil spring extending round the cylinder radiating ribs.

As a striking contrast to the Excelsior's new models, an old machine built by the company in 1902 is exhibited. It is fitted with a 24 in. frame, 28 x 2 wheels, and 2½ h.p. M.M.C. engine. This was, of course, fitted with rigid forks, atmospheric valves, surface carburetter, and coil and accumulator ignition.

Wire coils are arranged around the cylinder head of the big single-cylinder Excelsior.

The lubrication of the Excelsior is somewhat unusual, and it has been slightly altered for 1913. Oil is led to a lug cast between the valves of the cylinder, whence a hole is drilled into the cylinder on a level with the gudgeon pin when at the bottom of its stroke. Thus oil reaches the small end bearing through the hollow gudgeon pin, but the lug is also drilled down to the crankshaft bearing, from which it is led by ducts to all the main bearings.

**F.N., No. 19.**

5 h.p. MODEL: Four cylinders, 52½ x 57 mm.; automatic inlet, over exhaust; F.N. automatic carburetter; shaft drive; F.N. two-speed gear.

F.N. (ENGLAND), LTD., Great Portland Street, W.—Ten examples of the F.N. are exhibited, two of them nickel-plated all over. Several alterations have been made in the new four-cylinder model, and the lines of the machine have been somewhat altered so that they should conform with the English ideas of a standard machine. The engine remains practically unaltered, except for the strengthening of certain reciprocating parts. Two plates have been added to the clutch, and a kick starter is now fitted. A neat two-speed gear is incorporated in the casing of the shaft drive. This gear is of the sliding type. The high gear is direct, and is engaged by a sliding dog; the low gear is engaged by a sliding gear wheel. The shafts run on adjustable ball bearings, and the portion

**The Olympia Show.—**

on which the dog slides is castellated. The gear casing is of cast steel, and has an inspection door. The frame is somewhat lower, and has a dropped top tube, giving a saddle position nearly four inches

New .A.P. 3 1/2 h.p. engine with overhead inlet valve on a Hobart.

lower than in previous models. A front wheel stand has been added, and the carrier and part of the rear mudguard are detachable to facilitate tyre repairs. Pannier toolbags are now fitted. The tank is shallower but wider, and holds 1 1/2 gallons of petrol and nearly half a gallon of oil. It now has an enamel finish instead of the oxidised finish so well known on these machines. Large glass-topped filler caps are used; a strainer is placed inside each filler cap, and, in addition, a filter is fitted between the tank and the petrol pipe. Lubrication is arranged on the sight feed drip plan; once the adjustment has been set it is only necessary to pull up the pump handle and the feed is automatic. A gear and shaft drive cut in section demonstrates the extreme simplicity of the gear. The carburetter is of the semi-automatic type. An extra air valve of novel design with a delicate action is situated over the jet and controlled by a handle-bar lever.

2 1/2 h.p. MODEL: Single-cylinder, 65 x 85 mm.; m.o.v. side by side; F.N. automatic carburetter; shaft drive; F.N. two-speed gear.

This model remains unaltered except for the finish, the tank being now enamelled and plated rims being fitted. Side exten-

sions are now fitted to the mudguards, and the saddle position is very low.

The ten motor cycles shown comprise a 2 1/2 h.p. and 5 h.p. in section, a 2 1/2 h.p. and 5 h.p. finished in French grey, a 2 1/2 h.p. and 5 h.p. plated all over, a 2 1/2 h.p. and 5 h.p. finished in black with gold lines, and two 5 h.p.'s fitted with somewhat novel sidecars.

**FORWARD, No. 26.**

M. G. VARLEY, Sparkbrook, Birmingham.—Eight different models of the Forward sidecar. The latest pattern is provided with a step at the side, and an apron of Cape cart hood material, which is fastened by means of spring fasteners.

Another model has a special frame made to support a suit case behind, and at the side of this there is a subsidiary frame carrying a specially constructed spare petrol can. On the luggage grid there are springs to prevent the box from rattling. A further model is provided with an efficient double folding wind screen, whilst the type illustrated on page 1316 of our issue of November 14th is also exhibited. Yet another model is provided with a screen and hood.

**GLORIA, No. 76.**

GLORIA CYCLE CO., LTD., Coventry.—The centre of attraction is undoubtedly the Projectile sidecar, which was recently described and illustrated in our columns. This is specially built for use with high-

other models of more conventional design with special extension at the back to carry a touring bag and petrol can.

**GRANDEX, No. 107.**

GRANDEX MOTOR CYCLES, Gray's Inn Road, W.C.—The chief models for 1913 made by this firm are a 5-6 h.p. twin for sidecar work, a 4 1/2 h.p. single-cylinder for sidecar work, and a 3 3/4 h.p. Tourist model, all of which are fitted with Sturmey-Archer three-speed gears. In addition to these there are the 3 3/4 h.p. and 2 3/4 h.p. T.T. single-gear models and the 2 3/4 h.p. competition model and a 2 1/2 h.p. lightweight. All of these machines are fitted with Precision engines, Best and Lloyd lubricators, and the same double dropped frame which was introduced at the end of last year. The carrier is slightly altered, being made rather more strongly and attached to the rear mudguard, and Saxon forks are used on all models. The magneto is handle-bar controlled, and the latest pattern automatic Brown and Barlow carburetter is fitted.

**HAZLEWOOD, No. 54.**

5 h.p. MODEL: 70x76; side by side m.o.v.; B. and B. carburetter; chain and belt; three-speed Armstrong gear.

HAZLEWOODS, LTD., Coventry.—The twin Hazlewood is quite a new model, and is an extremely interesting and well-

3 h.p. three-speed twin-cylinder Hazlewood.

powered machines and is luxuriously fitted. It has a parcel-carrying receptacle in the back, and a spare tyre carrier and cover. The extreme front of the body is carried on a helical spring.

The Gloria spring wheel remains practically as heretofore. There are several

designed machine. Its most notable feature is the fact that an Armstrong three-speed hub is mounted so as to form a counter-shaft which is driven by chain, the latter being entirely enclosed in an aluminium case. The final transmission is by belt. The usual method of operating the Armstrong gear is employed.

The foot brake operates a fibre block through a rocking shaft and takes effect upon the outside circumference of the brake rim. Both cylinders discharge into a single silencer, which is immediately underneath and forward of the crank chamber. Above this is the magneto, which is driven by chain. A similar model to the above is shown with three-speed Armstrong gear in the hub.

The now well-known 2 3/4 h.p. 70 x 76 machine is also fitted with Armstrong hub gear.

Plan section of F.N. transmission.

## The Olympia Show.—

**HOBART, No. 77.**

2½ h.p. T.T. Model: 65 × 100 mm.; overhead m.o.i.v.; Bosch magneto; B. and B. carburetter; belt; Hutchinson tyres.

HOBART BIRD AND CO., LTD., Coventry.—The 2½ h.p. T.T. machine is quite a new model. The engine is fitted with very accessible overhead valves having

Waterproof plug terminal adopted on all Hobart machines.

adjustable tappet rods and very strong rockers. The tank is of the torpedo shape, and lubrication by automatic drip-feed. This machine is said to be capable of 50 m.p.h.

The popular ladies' model 2½ h.p. has a new frame in which the engine is fitted vertically instead of being inclined as before. The

engine is improved in detail and is slightly larger (300 c.c.) than before (292 c.c.). The three-speed is a Sturmey-Archer. All controls, including the magneto (an enclosed Bosch), are on the handle-bar.

3½ h.p. Model: J.A.P., 85.5 × 85 mm.; overhead valve; Bosch magneto; B. and B. carburetter; belt; Hutchinson tyres.

The motive power of the 3½ h.p. model is an improved J.A.P. engine with overhead inlet valve. The Villiers F.E. hub is standard on this machine. A front wheel stand is fitted, and the carrier is provided with pannier plates to carry the toolbags. Large glass-topped filler caps take the place of gauges. By loosening two screws the back mudguard can be turned back to facilitate tyre repairs.

4 h.p. Model: Twin Hobart engine, 68 × 76 mm.; Bosch magneto; B. and B. carburetter; belt; Hutchinson tyres.

The sidecar machine, a 4 h.p. twin, has been brought quite up-to-date and the size of the valves and exhaust pipes increased. The fittings are the same as in the other models. An Armstrong sidecar gear is standard (this gear starts with the back wheel on the ground). The petrol consumption is said to be quite moderate.

A neat looking twin-cylinder lightweight Hobart with hub three-speed gear.

**HUMBER, No. 52.**

3½ h.p. Model: 84 × 90 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; Sturmey-Archer or Armstrong three-speed gear.

HUMBER, LTD., Coventry.—Several improvements have been made to the 3½ Humber. In the type which is designed for sidecar work, and which is shown attached to the latest Humber coach-built sidecar, a simple and strong form of kick-starter is employed, consisting of a chain sprocket with a single crank mounted upon a bracket brazed on to the off side chain stay. The bracket which supports the spindle also serves to carry the fulcrum of a very large and well-designed fibre foot brake.

A special mudguard forming a side extension to the rear guard is fitted to protect the belt. A very sensible-sized silencer is now used, and is placed forward of the engine, having a plain outlet pipe extending rearwards behind the bottom bracket. All the 3½ h.p. models are furnished with a crossbar for accessories between the grips of the handle-bars. In addition to the above, the 3½ h.p. model is exhibited with a fixed gear and also with a Villiers clutch hub.

2¾ h.p. Model: 60 × 60 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; Armstrong three-speed gear.

The improvements which have been made in this machine are similar to those which have been outlined above and in

previous issues regarding the 3½ h.p. model. This machine is shown in T.T. form, as well as with fixed and three-speed gears.

2 h.p. Model: 60 × 70 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; Armstrong three-speed gear.

The lightweight remains unchanged for next year. Its features are already well known. The cylinders in this and all other Humber motor bicycles are considerably off set.

**INDIAN, No. 108.**

3½ and 7 h.p. Models: 82½ × 93 mm.; m.o. inlet over exhaust; Indian carburetter; chain transmission; counter-shaft two-speed gear.

THE HENDEE MFG. CO., Great Portland Street, W.—The new Indian design in which the back part of the frame is spring-supported has already been dealt with in *The Motor Cycle*, but one of these machines fitted with a sidecar exemplified in an extraordinary manner how the provision was made for the play of the back springs when attaching the sidecar. In this an attachment coming from close to the seat-pillar was provided with a hinged joint. Apart from the new spring-hung models, the most striking machine is the Tourist Trophy Indian, distinguished by its short wheelbase and the rakish appearance of its steering head. In all the machines Indian practice is followed throughout; that is to say, the engine is supported on a curved bottom

Valve side of the 3½ h.p. three-speed Humber.

2 h.p. Humber lightweight model.

**The Olympia Show.—**

tube, cylinders are constructed with detachable combustion heads, and an overhead rocker-operated inlet valve. Perhaps most important of all, lubrication is fed to the engine mechanically by a geared down force pump. In the new engines, too, roller bearings are used on the big ends, and the gear-driven magneto is of the waterproof pattern. The transmission to the two-speed countershaft is, as before, by chain, and thence through a plate clutch. The Indian transmission has been carefully studied, and is very soft in action. The movement of the laminated spring at the front is transmitted to the front wheel by forks joining on to one arm of a bell crank lever pivoted on the axle spindle, and supporting on the end of its other arm the trussed forks. The handle-bars are designed so as to allow the articulated throttle and exhaust valve control to be brought to their work in a straighter line than of yore, and thus put less severe work on the joints. Of course, the machines, which are all finished in Indian red, make a very striking exhibit.

**IVY, No. 16.**

2½ h.p. T.T. MODEL: 70 × 90 mm.; side by side m.o.i.v.; Amac carburetter; belt.

S. A. NEWMAN, Lichfield Road, Birmingham.—The 2½ T.T. model is fitted with a Precision engine, provided with an extra large exhaust valve, and is the same as that used by H. C. Newman in the Junior Tourist Trophy Race last July. It is provided with a forced induction device, consisting of a pipe running from the crank case to the jet, the theory being that the descending piston sends a column of warm air up the jet, forcing the petrol with it. This device is also fitted to the 3½ T.T.

2½ h.p. MODEL: 70 × 75 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; Brampton variable gear.

The 2½ h.p. model is fitted with a smaller Precision engine, but has a Brampton variable gear.

3½ h.p. MODEL: 85 × 88 mm.; side by side m.o.i.v.; Amac carburetter; belt; B.S.A. two-speed gear.

The 3½ h.p. T.T. model is similar in most points to the other machines mentioned, except that a Best and Lloyd lubricator is fitted instead of the ordinary pump.

The lady's model is quite an interesting machine. It is of 3½ h.p., with Sturmey-Archer three-speed hub and a kick-starter device. The top tube of the dropped frame is in duplicate, and encircles the tank, which is bolted to it. Efficient shields protect the lady's dress.

in a separate frame provided with ordinary fork ends which render the wheel interchangeable with the front wheel of the motor bicycle.

**JAMES, No. 65.**

3½ h.p. MODEL: 86 × 96 mm.; S.S.; B. and B. carburetter; James three-speed in counter-shaft; chain.

THE JAMES CYCLE CO., Greet, Birmingham.—These machines all have the same

1913 3½ h.p. twin three-speed Trump-Jap.

Comfortable footboards are fitted. The lubrication is by drip feed pump, and a comfortable saddle is provided.

The 3½ h.p. touring model has wide handle-bars and comfortable saddle, B. and B. carburetter, and B.S.A. two-speed gear, while the mudguarding is good, and it is a thoroughly serviceable machine. The water-cooled T.T. model, with Green Precision engine (same dimensions as above), is another mount which attracts attention.

4½ h.p. MODEL: 90 × 96 mm.; side by side m.o.i.v.; Amac carburetter; belt; Sturmey-Archer gear.

The sidecar model has an Ivy make sidecar with coach-built body hung inside a rectangular frame, and is supported on four coil springs. The wheel is carried

sized engine, but are turned out in a variety of forms.

The three-speed model is most interesting, and this we recently described and illustrated. The gear is in the counter-shaft, and is worked by sliding a toothed wheel which has dog clutches on either side.

For high and low gears the dog clutches come into engagement and the wheel itself for the middle gear. Combined with this is a very effective multiple plate clutch. The back brake is of the internal expanding type. The footboards are supported by springs at the rearward end. The engine is fitted with a decompressor operated by a Bowden wire on the handlebar. Another lever controls the magneto. The silencer has an extension pipe running to the rear and has no cut-out. The tank is made in one piece, supported on brackets from below. The filler caps are on the right-hand side—a great convenience when a sidecar is attached to the left.

Lugs for attaching the sidecar are permanently brazed to the frame. The standard sidecar is the James-Canoelet. This has three-point attachment, and underneath is fitted a large silencer connected with the expansion chamber on the machine by a flexible pipe. Other models are fitted with the James two-speed gear, the Sturmey-Archer three-speed hub, and the Villiers free engine. The mudguards are provided with side flaps of suitable dimensions.

One point about the kick starter is worthy of mention; the first tooth is made movable, so that it is impossible for the teeth to meet end to end as the movable tooth slips to one side and the drive is taken up smoothly. Another important item is that the kick-starter gear is entirely enclosed in the gear box casting and thus protected from mud.

Ivy-Precision three-speed machine for 1913.

## The Olympia Show.—

**KERRY-ABINGDON, No. 58.**

3½ h.p. MODEL: 85 × 88 mm.; side by side m.o.i.v.; B. and B. carburetter; chain and belt; two-speed gear.

THE EAST LONDON RUBBER CO., Great Eastern Street, E.C.—The most pro-

Twin-cylinder Kerry-Abingdon with chain and belt drive two-speed gear.

minent feature on this machine is the two-speed gear, which is arranged so that a belt transmits the power on the high ratio and a chain on the low. In both cases the transmission is direct. The belt pulley and a small chain sprocket are connected to the engine-shaft by means of an enclosed leather faced clutch, which is worked from the left handle-bar grip. This clutch therefore applies to both high and low gears. Behind the bottom bracket a chain countershaft is arranged, with its driving sprocket on the side of the machine opposite to the driven one. The belt rim and the final drive sprocket are therefore on opposite sides of the back hub. The change of gear is effected in the hub by a clutch device worked by a small lever on the side of the petrol tank, which connects either of the two drives. When the top gear is in operation the low gear chains run idly, and *vice versa*. The front forks are of the Kerry type with enclosed springs.

A case with a quick detachable lid for spare belt or inner tube is fixed at the back of the carrier, at each side of which is a pannier toolbag of good size. The 3½ h.p. machine is also shown with a single gear.

6 h.p. MODEL: Side by side m.o.i.v.; B. and B. carburetter; chain and belt; two-speed gear.

This model is shown attached to a sidecar, and has exactly the same form of transmission system as that adopted in the one previously described. The sidecar is of pleasing shape, and special attention has been paid to luggage and tool-carrying capacity, there being a deep pocket behind the back of the seat and a cupboard underneath it. The twin engine has separate silencers, both of which are fitted with cut-outs. In all models a front wheel stand is fitted, which also acts as a mudguard stay.

**KYNOCH, No. 44.**

4 h.p. MODEL: 85½ × 85 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; three-speed Sturmey-Archer.

KYNOCH, LTD., Birmingham.—Careful attention to detail and studied construction generally are characteristics of the

A third machine is a 6 h.p. twin Kynoch also fitted with a V-type J.A.P. engine and a three-speed Sturmey-Archer gear. In all the Kynoch models commendable large pannier tool cases are fitted to the side of the carrier. Automatic drip-feed lubrication is provided.

**LEA-FRANCIS, No. 73.**

3½ h.p. MODEL: Two cylinders, 60 × 70 mm.; side by side m.o.i.v. Amac automatic carburetter; Lea Francis two-speed gear; chain.

LEA-FRANCIS, LTD., Coventry.—This machine is a new-comer to Olympia, but its appearance is attracting considerable attention, the model finished throughout in what is known as beech colour being especially distinctive. For a new make we have seldom seen a machine in which detail has been so carefully studied before production, and the name of Lea Francis in the push cycle world is sufficient guarantee of excellence of work-

Lea-Francis kick-starter quadrant.

Kynoch machines. Amongst several notable features may be mentioned the fact that a special bracket for supporting the quadrant and lever of the gear control is brazed to the top tube and forms a very neat fitting. The engine is a J.A.P., and has the magneto set forward of the crank case immediately over a large aluminium silencer. The latter is furnished with a foot-operated cut-out. Pedalling gear is provided, and there are also a pair of rubber-covered footrests, and these are adjustable both as to height and fore and aft positions. Druid spring forks are used, and the lower stay of the front mudguard serves as a front wheel stand. A similar model to the above, but without the three-speed gear, is also shown.

6 h.p. MODEL (V. twin): 75 × 75 mm.; mechanical side by side; B. and B. carburetter; belt; Sturmey-Archer.

manship. All the small fittings, such as the nuts, brake levers, mudguard stays etc., are finished with a black non-rustable finish, which from a weather-proof point of view has a great advantage over nickel plating. The only portions which are nickel-plated are those which are the least likely to rust. One of the most striking features is the chain guarding, which is particularly well carried out. It is claimed that these guards are grease-proof and do not rattle, and they have been so arranged that they do not detract from the appearance of the machine. The front chain case serves also for a cover to the magneto chain, which is driven from the crankshaft, the magneto lying behind the crank case. The two-speed gear is of the sliding type, and is

Now 6 h.p. twin-cylinder Kynoch with Sturmey-Archer gear.

**The Olympia Show.—**

mounted eccentrically in a special bottom bracket casting in such a manner that the chains can be adjusted without interfering with the adjustment of the kick starter or gear operation. Mudguarding has received special attention, with the result that the machine is one of the best protected mounts in the Show. Long footboards are fitted, between which lies a large double silencer. The rear wheel is of the quickly detachable type, it being only necessary to withdraw a single bolt and a small distance piece to remove the wheel complete, but without disturbing the rear sprocket, which remains *in situ*. A feature is that both front and rear brakes are of the internal V type acting on dummy belt rims, and are so arranged that they do not interfere with wheel removals. The lines of the frame have been designed to give a harmonious appearance, and every Bowden wire has neat clips cast with the frame lugs to accommodate it. The high-tension wires are carried in metal tubes, which are easily detachable, as they are held to the frame by a neat internal spring clip. The rear portion of the back mudguard is removable, and detail work is extremely good, even the joint pins working on hardened steel bushes. Pannier tool bags are fitted in a specially constructed carrier. A small leather case carrying an inner tube is fitted above the front wheel between the stays of the spring forks, and Brooks's pan-seat is provided. Inside the petrol tank, where it can be easily seen through a large filler cap, is a baffle plate marked alternately black and white, by which the petrol level can be easily judged. Only one type is mar-

is now dropped at the rear, and an automatic lubricator is fitted.

2½ h.p. MODEL (twin): 58 × 66 mm.; two-stroke; Amac carburetter; chain and belt; single-speed gear.

This model is an entirely new one. The cylinders are placed side by side, and the magneto is carried on the rear of

this was thought to be a source of danger should there be any petrol about owing to the tank being overfilled.

**L.M.C., No. 88.**

¾ h.p. MODEL: 85 × 88 mm.; side by side valves; B. and B. or Amac carburetter; belt and chain; L.M.C. two-speed or Anto-varia.

THE LLOYD MANUFACTURING CO., Monument Road, Birmingham.—The

Chain and belt drive on the Levis single-cylinder. (belt on right side of machine).

the engine. A drip-feed lubricator is fitted. The same system of lubrication is employed on this model as in all Levis machines. The oil is conducted down the sides of the cylinders to the main bearings, thence through a hollow crankshaft to the big end, afterwards lubricating the cylinders by splash. Oil also flows into the main bearings and to the bearings of the magneto drive.

One and a half gallons of petrol are carried. With a two-stroke two-cylinder engine almost as even running is obtained as with a four-cylinder of the ordinary type. The twin Levis runs with extreme smoothness. The exhaust release situated at the top of the cylinder is now covered in so that no flame can issue therefrom, as

The efficient rear mudguard on the new L.M.C. Note also spring-operated stand and new tool case.

model chosen for description made its first public appearance in the A.C.U. six days' trials, where it gained a gold medal. Most of the features of the L.M.C. are still retained, that is to say, the engine

L.M.C. flywheels and connecting rod showing roller bearing at big end and universal joint at small end.

is unaltered except for adjustable tappets. The silencer lies in front, and the rider's legs are protected from the exhaust gases by a neat cover. Sprung footboards are used, and the principle of the L.M.C. spring fork is retained; this, however, has undergone some im-

Neat ball head change speed lever of the Leà-Francis.

ported, and three specimens of this are on view. We have already dealt with the running of this excellent medium-powered twin, and we have no doubt that before long private owners will be singing its praises.

**LEVIS, No. 39.**

2½ h.p. MODEL: 70 × 70 mm.; two-stroke; Amac carburetter; belt; single-speed gear.

MAILERS, LTD., Station Street, Birmingham.—This particular model remains practically unaltered for 1913.

2 h.p. MODEL: 62 × 70 mm.; two-stroke; Amac carburetter; chain and belt; single-speed gear.

This machine is similar in most respects to the above, except that it is provided with a combined belt and chain transmission, the rearward portion of the chain being protected by a case. The top tube

Twin-cylinder (side by side) Levis two stroke, with belt and chain transmission on left of machine.

**The Olympia Show.—**

provement. In addition to previous descriptions, one other new feature of the engine consists of a decompressor which is operated by a small lever on the tank. This provides particularly easy starting and slow running. The L.M.C. two-speed

4 h.p. MODEL: 89×92 mm.; side by side valves; B. and B. or Amac carburetter; belt; Sturmey-Archer three-speed or Auto-varia.

This model resembles the 3½ h.p. in nearly all particulars, but a Sturmey-Archer gear is fitted and the well-known

L.M.C. two-speed model, fitted with kick-starter, footboards, and specially efficient mudguards.

gear was described in a recent issue, and it is only necessary to remind our readers that the high gear is by belt direct and the low by chain. The front fork is now fitted with a special spring which takes both thrust and rebound strains, and is pivoted on plain bearings. The mudguarding has received special attention.

The rear part of the rear guard, together with the carrier, is readily detachable to facilitate tyre repairs. A neat and simple kick-starter is fitted on

L.M.C. footboard starter, by means of which the engine is revolved by depressing the rear end of the footboard. A similar model is shown fitted with the Roc two-speed gear.

**LINCOLN-ELK, No. 121.**

2½ h.p. LIGHTWEIGHT, 3 h.p., 3½ h.p., and 4½ h.p. MODELS: 70×72, 79×82, 85×88, and 89×96 mm.; side by side m.o.v.; B. and B. carburetter; two-speed counter-shaft; belt and chain.

J. KIRBY, Broadgate, Lincoln.—The four models specified above are all single-cylinder machines, the lightweight being the only model to which the two-speed gear, mentioned in our issue of the 21st inst. (page 1329), is not fitted. This counter-shaft is a remarkably compact design; it is driven from the engine by a chain, protected by a neat sheet aluminium cover, and on the high gear

Operating mechanism of the Lincoln Elk counter shaft gear.

drives through a belt on the left side of the chain, on the low gear through a chain on the other side of the wheel. High and low gears are each fitted with a separate clutch, which is simplicity itself, consisting merely of a split bronze ring of good bearing surface, contracted by the operation of a side cam so as to grip tightly and transmit the power. As the diameters of these rings are con-

siderably less than four inches, the clutches are very compact, and the side cams are worked by a single lever carried up the side of the tank.

A feature in the 4½ h.p. model is the stay brought down from a point on the seat-pillar below the tank to the bridge joining the lower back wheel stays. A coachbuilt sidecar is shown in conjunction with the 3½ h.p. Lincoln-Elk, while

Details of the Lincoln Elk kick-starter.

a 4½ h.p. machine is fitted with a new sidecar made by Rey, of Hampstead.

In this model the sidecar wheel is practically given a separate spring suspension, working as it does on the end of a lever pivoted to the sidecar axle and controlled by strong helical springs. The design is quite new, but we have not tried it.

**MATCHLESS, No. 74.**

3½ h.p. MODEL: 70 × 64½ mm.; m.o. valves; Amac carburetter; chain and belt; Armstrong three-speed hub, Mark VI.

H. COLLIER AND SONS, Plumstead.—All the Matchless machines for the ensuing year are fitted with twin engines. This new model is provided with the now popular counter-shaft drive, in which belt and chain are combined.

New Hudson clock spring.

6 h.p. MODEL: 76 × 85 mm.; mechanical side by side valves; Amac carburetter; belt; V.S. two-speed hub.

Several of these machines are in evidence, fitted with single and double belt drive. A new feature is the substitution of a foot starter for pedals. This is attached to the bottom stays, and drives by a chain through the free-wheel provided for the pedalling chain.

8 h.p. MODEL: 85 × 85 mm.; mechanical side by side valves; Amac carburetter; belt or chain; V.S. two-speed or Matchless C gear.

The chain-driven model is essentially a machine for passenger work. The Matchless gear on the counter-shaft is operated by dog clutches; the friction clutch is of the metal-to-metal cone type. Several sidecars with Matchless chassis were attached to machines on this stand.

6 h.p. Motosacoche Engine.

a counter-shaft, a pedal being fitted on each side so as to form an additional footrest. The carrier is of unusual shape, and has a sloping rear portion which carries a toolbag of considerable dimensions. This is so arranged that the top of the bag lies flush with the carrier and provides ample luggage accommodation. Both foot and hand brakes act on the rear belt rim, being placed one below and one above the rear chain stay.

## The Olympia Show.—

New 350 cc. lightweight Norton, another late arrival in the Show.

1913 Veloce 2 1/2 h.p. two-speed machine.

**MELEN EXPRESS, No. 57.**

6 h.p. MODEL (twin): 76 × 85 mm.; side by side m.o.i.v.; B. and B. carburetter; Roc two-speed; belt.

F. AND H. MELEN, LTD., Cheapside, Birmingham.—This firm show a very sturdily made sidecar combination in which the motor cycle is upon standard lines with a large petrol tank and a pronouncedly dropped frame. The rider's comfort is provided for by the use of the Melen patent spring handle-bars, which insulate the wrists and arms from road shocks.

A Roc two-speed hub gear is controlled by pedals fitted on the footrests, which are of the plain tubular variety. The engine is standard J.A.P., with a single silencer to both cylinders. The sidecar is made on neat lines with a cane body, in which attention has been paid to luggage carrying. A fourth attachment tube is taken from the top of the head to the sidecar chassis to give extra rigidity.

The attachments are of the positive nut and bolt type. Generally speaking, the combination presents a very agreeable and practical appearance.

**MILLFORD, No. 63.**

MILLS-FULFORD, Coventry.—An excellent display of sidecars of all kinds. The rigid type is most numerous, but there are also examples of spring wheel, castor wheel, and the radial castor. The chassis are practically of two types, the dropped

frame being very popular; this allows a low position for the body, and is very suitable for attachment to modern types of motor bicycle. The frame tubing of this chassis, as well as all other Millfords except the lowest priced model, is duplicated where the rear wheel attachment is fixed. This allows the attachment lug (which is a steel forging) to move backwards and forwards, so providing perfect alignment of the wheels. One rigid wheel model is so constructed that the wheel spindle is supported on both sides. At the same time it can be removed very simply by withdrawing the wheel pin. No less than nine different chassis and twenty-four distinct bodies are supplied by this firm. Two very attractive bodies are those finished in varnished wood and designed on the stream-line principle, the wood used being three-ply. A large parcel post sidecar carrier occupies the centre of the stand. Several of the sidecars are shown attached to motor cycles.

**MONOPOLE, No. 56.**

3 1/2 h.p. MODEL: 85 × 88 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; Sturmey-Archer three-speed.

THE MONOPOLE CYCLE AND CARRIAGE CO., LTD., Foleshill, Coventry.—The Monopole machine was described in *The Motor Cycle* of the 21st, page 1335, and it therefore suffices for the moment to say that it is designed upon standard lines and has no particularly outstanding features beyond its obvious good workmanship and sturdiness of construction. Saxon spring forks are used.

The frame is dropped, and the petrol tank is of exceedingly neat appearance, an automatic drip-feed lubricator being a standard fitting. A pedalling gear is fitted, and special means have been taken to prevent the pedal crankshaft rotating of its own

accord. Sturmey-Archer hub gears are provided with the standard means of operation. A 2 1/2 h.p. machine is shown which is upon exactly similar lines with the exception of the engine dimensions, which are in this case 70 × 76 mm.

**MONTGOMERY, No. 127.**

7 h.p. HENDERSON: 64 × 76 mm.; overhead m.o.i.v.; Schebler carburetter; bevel and chain.

MONTGOMERY AND CO., LTD., Coventry.—In addition to the four-cylinder Henderson, one of the most distinctive exhibits is in the modèle de luxe sidecar,

A "Shell" wicker sidecar on the Montgomery stand.

specially designed for these machines. This has a coach-built torpedo fronted body with side doors, wind screen, and is luxuriously upholstered. The front of the chassis is trussed for extra strength, whilst at the rear it is carried well back to accommodate a neat luggage case and extra petrol can. To allow for variety in height and angle of bicycle frames a new fitting has been designed. This device was recently illustrated. To those interested in racing work, the sporting model, with a wicker body shaped like an artillery shell, will appeal.

**MOTO-REVE, No. 117.**

2 h.p. and 4 h.p. MODELS: 62 × 85 and 63 × 80 mm.; m.o. valves; B. and B. carburetter; chain and belt; two-speed counter-shaft and hub.

MOTO-REVE, LTD., Acton Vale, Middlesex.—The exhibits on this stand are of two types, single and twin-cylinders. The latter have overhead valves, adjustable tappets, and chain drive through a two-speed counter-shaft with expanding ring clutch. The front chains are totally and the back semi-enclosed. Both engines are started by handle, which is applied to the counter-shaft.

A Millford sidecar known as the "Streamline." A sidecar on the true streamline principle was suggested in "The Motor Cycle" several months ago.

### The Olympia Show.—

The magneto is carried in front and the carburetter is automatic or hand-controlled as desired. The exhaust is taken from each cylinder by a separate long tube with splayed end carried to the back of the rear wheel.

The convenient long footboards are easily detachable, and on the front wheel the mudguarding is carried complete right through the front forks.

By the loosening of two nuts the back carrier and half the rear mudguard can be swung clear to leave the tyre free for repairs. Oil is fed to the engine by pressure obtained from a pump, and a neat gauge registers the pressure, which can be maintained for considerable periods, the flow of oil being adjustable through a sight-feed needle valve. In all machines an extra long toolbag carried on the tank top and bridging the top tube allows of tools of reasonable length being carried.

The 2 h.p. single-cylinder machine, with two-speed hub gear has been designed for those who want a convenient little mount at a moderate price. The two-speed hub is of the firm's own manufacture, and adds but 5 lbs. extra weight to the machine. In other respects this machine embodies the practice that the Moto-Réve firm have already made well known.

### MOTOSACOCHE, No. 102.

3½ h.p. MODEL (two-cylinder); 64 × 77 mm.; side by side valves; Amac carburetter; chain; two-speed counter-shaft gear.

MOTOSACOCHE, LTD., Holborn Viaduct, E.C.—The most noticeable features of this engine are the horizontal radiating ribs and the position of the valves which are disposed in front of the front cylinder and behind the rear cylinder. The petrol injection taps are fitted to lead the petrol into the cylinder about half-way down. This makes the freeing of the piston a simpler job, and also causes the taps to act as half-compression devices. The tank has a large capacity, and lubrication is carried out simply by hand pump.

The frame has a straight top tube, but is so arranged that it gives a low saddle position. Footboards are fitted, and the counter-shaft chain drive is excellently carried out. Side flaps are fitted to both

front and rear guards. A handle starter is fitted to the counter-shaft. A similar machine to this is exhibited attached to a sidecar, and we are told that it is fully capable of this work.

The 2½ h.p. model resembles the above except for the fact that its twin-cylinder engine has a bore and stroke of 54 × 75 mm., the one alteration in this model consisting of bigger valves.

Besides this, two models of the well-known Motosacoche lightweight are shown. The 2½ h.p. has a single-cylinder engine of 64 × 80 mm. bore and stroke and a variable pulley gear, and the 2 h.p. which is fitted on a lady's dropped frame, has a bore and stroke of 62 × 75 mm. Both these models remain unaltered except for the position of the paraffin injection tap.

A very interesting engine is the 6 h.p. twin, 72 × 91 mm. This is offered to those desirous of building sidecars or cyclecars. The engine was described in our issue of the 21st inst. The castings are extremely well finished throughout, and we are told that this finish is absolutely standard. The timing gear is unusual, one large cam serving to operate both exhaust valves, while a separate one is fitted for each inlet valve.

Another novelty shown on this stand is the De Lissa patent balanced valve, which is shown in section on a 2½ h.p. engine. It will be remembered that this valve has two seatings, one in the upper part of the combustion head, and one in the usual place. This valve, besides increasing the power of the engine, keeps it extraordinarily cool, even under prolonged work. At first sight it would seem that it would be difficult to obtain good compression with two seatings on one valve, but we are assured that this is not the case, and certainly the machine which we were enabled to try a short time ago had most excellent compression.

### NEW COMET, No. 250.

A. H. HADEN, Princip Street, Birmingham.—Among the various sidecar frames on this stand a drop frame called The Dual frame, suitable either for passenger or commercial purposes, demands attention, affording, as it does, a very low position, combined with great strength, while the quick detachable fittings are neat. The drop frames for touring work have also quick detachable fittings.

The most important exhibit, however, is a new registered motor cycle frame, in which the centre rail is replaced by two parallel square section tubes, on which the tank rests, and to which it is held by four bolts. Thus, the tank can be quickly removed, and the space between the two supporting tubes affords ample head room for getting at the engine, with-drawing cylinders, and so forth.

### NEW HUDSON, No. 62.

2½ h.p. MODEL: 70 × 90 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; Armstrong gear.

THE NEW HUDSON CYCLE CO., LTD., Summer Hill Street Works, Birmingham.—Special features of the New Hudson engines are the off-setting of the cylinder and the position of the magneto, which is supported on a platform bolted to the crank chamber, which brings it immediately behind the cylinder. It is

New Hudson silencer with central pipe fitting, also showing foot plates upturned at the front.

exceptionally well protected from mud and wet. The magneto drive is by chain, which is, of course, enclosed in a neat aluminium case.

The clutch control is by means of a double-ended pedal working on the dead centre principle, and placed immediately above the right footboard, whilst the gear control is by an improved quadrant on the side of the petrol tank. The lever is now fitted with a polished vulcanite handle.

The footboards are cast aluminium, and are nicely curved. A kick starter is fitted, and takes the form of a crank carried by a bracket on the right chain stay, which is connected to the hub gear with a chain and sprocket. A clock spring is used to return the crank, and the free-wheel clutch is mounted on the hub.

P. & M. sidecar combination, sold complete.

6 h.p. twin two-speed Ariel sidecar combination.

**The Olympia Show.—**

3½ h.p. MODEL: 85 × 88 mm.; side by side m.o.i.v.; B. and B. carburetter; chain and belt; three-speed Armstrong gear.

In this model the general specification follows the already well-known New Hudson lines, with, of course, the exception that a combined form of transmission is used. Between the engine and the bottom bracket is a ball bearing counter-shaft, driven by chain from the engine, and carrying a large belt pulley for the drive to the back wheel. The initial chain drive is entirely enclosed in an aluminium oil bath case. The control of the gear and clutch is the same as that already described. The footboards on this machine are supported in front on pivots and at the rear upon spiral springs. A new type of silencer is used, in which the exhaust pipe is led to the aluminium expansion box at a point near its centre, and the gas makes its exit through holes at each end. A ½ h.p. direct belt-driven model is also shown.

**NEW IMPERIAL, No. 67.**

3½ h.p. MODEL: 90 × 77½ mm.; m.o.v. overhead valves; Amac carburetter; belt.

NEW IMPERIAL CYCLES, LTD., Princetree, Birmingham.—This being a T.T. model it has a short wheelbase. Driped lubricators are fitted, and the tank supported from underneath on brackets.

4½ h.p. MODEL: 90 × 93 mm.; side by side; Amac carburetter; belt; Armstrong three-speed.

The footrests are adjustable, and the brake fittings attached to separate lugs. The carrier with the back guard attached is secured by a snap fitting below the saddle, and is easily turned back for repairs.

This model has a petrol gauge worked on a celluloid float within the tank. The tank is a particularly neat casting with almost square radiators.

5 h.p. MODEL: 76 × 85 mm.; side by side; Amac carburetter; belt; Roc two-speed.

These two models are particularly suited for sidecar work and have the side lugs brazed to the frame. The mudguards have very serviceable side flaps,

and the finish is black with a green tank. Stands are fitted to both wheels. In addition to these models 2½ h.p. and 3½ h.p. touring models are supplied with similar details.

The New Imperial sidecar frame has a tube running all round, into which the body is dropped. This gives great strength and a low riding position. At the back are special supports for a bag and petrol tin. The sidecar body is fitted with a hood and screen.

**NORTON, No. 32.**

2½ h.p. MODEL: 70 × 90 mm.; m.o.i.v., side by side; Amac carburetter; belt; Armstrong three-speed.

NORTON MANUFACTURING CO., Sampson Road North, Birmingham.—On this new lightweight model the cylinder is off-set 10 mm., otherwise it follows the general features observed on Nortons.

3½ h.p. MODEL: 79 × 100 mm.; m.o.i.v., side by side; Amac carburetter; belt; Armstrong three-speed.

This machine may be taken as a typical example of Norton motor bicycles. The footboards are longer than last year's, rubber covered, and provided with a heel plate. Druid spring forks are fitted. An Armstrong three-speed gear is fitted, and both front and rear mudguards are provided with side shields.

The carburetters fitted to all Norton machines have specially large gauzes to the inlets. The magneto is the C.A.V., and is provided with a special cover made by the Norton Co.

The other models are a single-gear machine and a T.T. pattern. Pan seats are fitted to all the standards except the T.T., and it is interesting to note that all the joints of the carrier are welded, the tops, where the luggage fits on, being absolutely flush.

4 h.p. MODEL: 82 × 120 mm.; side by side m.o.i.v.; Amac carburetter; belt; Armstrong three-speed.

This machine, except that it is fitted with a larger engine, is similar in every respect to the 3½ h.p. model, on which, as in the case of other Norton models, the exhaust box has a taper outlet, and the final exit is through a long pipe. The Big Four is shown fitted to a sidecar, and is specially constructed for passenger carrying.

**N.S.U., No. 109.**

2, 3, and 6½ h.p. MODELS: 58 × 72 mm., 73 × 78 mm., and 75 × 94 mm.; overhead m.o.i.v.; N.S.U. carburetter; belt; two-speed N.S.U. gear.

N.S.U. Motor Co., LTD., Great Portland Street, W.—The chief feature about the 1913 N.S.U. machine is the dual control carburetter, which was described and illustrated in *The Motor Cycle* of the 14th inst., page 1311. In other respects the

A smart touring sidecar on the N.S.U. stand. Observe the springing, auxiliary petrol tank and luggage grid.

only changes that have been made are in the drop frame and in the modification of the inlet valve design to one of the overhead tappet worked type. The frame is sprung at the back by a helical spring behind the seat-pillar and hinged at the bottom bracket extension. A heavier type of the well-known N.S.U. two-speed gear is being used for the two roadster models—the 3½ h.p. and 6½ h.p. twin and single-cylinders respectively—and it is worth remarking that the other pattern of gear is designed so that it is adaptable to any make of machine, either with fixed or adjustable pulleys.

Valve side of the three-speed Norton, fitted with kick-start.

3½ h.p. clutch model. Sun Precision.

**The Olympia Show.—**

Among the sidecars is one with the type of patent body that was shown last year, but, in addition, a wind screen, hub, luggage grid, and subsidiary petrol

separate chains from the engine, these chains being enclosed in a weather-proof case. A single chain on the off side of the machine transmits the power from the counter-shaft. The gear is operated

through which the air circulates. A large cooling surface is thus provided, the idea being to keep the temperature of the cylinder head at this point as low as possible. We are assured that the device works very well indeed.

**P. AND M., No. 87.**

3½ h.p. MODEL (single-cylinder); 84.5 x 83.9 mm.; side by side valves; P. and M. carburetter; chain; P. and M. two-speed.

PHELON AND MOORE, LTD., Percy Street, W.C.—As will be noticed from the above, the engine dimensions of the P. and M. have been somewhat increased so as to bring it just inside the 500 c.c. limit. No radical

alterations have been made, but several improvements of some import are to be seen on the new model. The engine is still fitted with the P. and M. decompressor, and it will be remembered that this was one of the very first machines to be so fitted. Detail improvements in the kick-starter consist of a folding pedal, an adjustment for the chain, and an adjustment for the trip mechanism actuating the ratchet. Special stops are also now fitted for this starting gear. The two front chains and expanding clutches are protected by a chain cover which comes close up to the crank case, and the eccentric bottom bracket adjustment for the chains has been considerably simplified; it is now only necessary to remove a set-screw from a notched quadrant, rotate the eccentric, and replace the set-screw in another hole. The silencer has been improved,

The latest P. & M. forks have triple stays. The lamp bracket is detachable.

The Wilkinson-Wooler, a two-stroke machine of unconventional design.

tank have been added. The handsome sidecar adapted for commercial purposes and fitted with a trade box body also calls for comment.

The models on this stand (the 2 and 3 h.p. single-cylinders and the 6½ h.p. twin) are entirely new. The first two are essentially solo machines. The 6½ h.p. is a useful machine for sidecar work.

Valve side of the 6½ h.p. N.S.U. This illustration shows the loop frame, exhaust leads and new carburetter.

**O.K., No. 55.**

6 h.p. MODEL: 76 x 85 mm.; side by side m.o.i.v.; Amac carburetter; chain; O.K. two-speed gear.

HUMPHRIES AND DAWES, Lancaster Street, Birmingham.—The 6 h.p. twin is a handsome machine specially designed for sidecar work. The two-speed gear consists of two clutches driven by

by a vertical rod and a handle, which is moved in a horizontal plane. In conjunction with the gear a hand starting arrangement is used, and consists of a chain sprocket carried on the saddle tube immediately below the tank, and connected with the counter-shaft through a long chain. A single silencer is used for both cylinders, and is furnished with an exhaust cut-out actuated by a rocking pedal placed in front of the left foot-board. These boards are of aluminium studded with rubber. A special brake rim is spoked to the back wheel, and on this the foot brake is applied. The petrol tank is very neatly designed, and is free from any sharp corners. Both this and the oil tank are fitted with large fillers.

3½ h.p. MODEL: 85 x 88 mm.; side by side m.o.i.v.; Amac carburetter; belt; three-speed Armstrong gear.

This model, together with the 2½ h.p. Precision-engined machine, is on standard lines, and has no features particularly to call for attention except a radiating device in the exhaust valve cap

T.T. 3½ h.p. O.K. Precision which, it will be noticed, has extra stays at the rear to ensure engine rigidity.

**The Olympia Show.**

and consists of a large diameter tube running longitudinally under the engine; inside this is a smaller tube through which the gas enters. Thence, after returning to the front, it is allowed to escape through two small diameter tubes, one on each side of the rear wheel. The frame has been strengthened throughout, twelve-gauge tubing being used. The front forks have been improved in detail, and it is now practically impossible for them to become clogged by mud. Additional girders are fitted to the front forks, and the lamp bracket is detachable. The forks are somewhat wider so as to allow for the passage of wider mudguards. The front guard has side exten-

New method of eccentric adjustment of the P. & M. gear.

sions for its full length and a large mud flap at the base. The rear guard has short side flaps, which prevent mud dripping on the chain. The upper part of the rear chain is also protected by a rear guard. A front wheel stand is fitted below the footrests. The petrol tank has rounded edges, and no taps are employed in its construction, needle valves only being used. A useful primer is fitted, which also serves as a drain tap should it become necessary to empty the tank. A portion of the rear mudguard is considerably lowered so as to provide ampleumping room for the pan saddle. A large toolbag is fitted between the rear mudguard and the saddle-pillar, and carries a paraffin can on one side and an oil can on the other in readily accessible positions. Lubrication is now on the automatic and Lloyd semi-automatic drip principle, and petrol and oil gauges are attached to the tank.

A colonial model is also shown, which is several interesting features, the most striking being probably the tank, which is as well on the near side extending throughout its complete length. This tank reaches to the bottom of the lower oil and gives a tank capacity of over 10 gallons. The colonial model is finished with all-black fittings throughout and has especially large ground clearance, this being obtained partly by the footrests being fitted somewhat higher up than the standard footboards. The finish of the machine is excellent.

Section of the new P. and M. silencer, which is very efficient.

A well-known fitting on P. and M. machines is the small metal tube carrier, which is supported by the side of the rear mudguard. A novelty on both P. and M. models is the fitting of a Hoffmann ball thrust bearing to take the strains of the operating gear.

New 6 h.p. twin Precision engine with overhead valves.

**POPE, No. 124.**

3 h.p. and  $3\frac{1}{2}$  h.p. MODELS: H,  $76 \times 94$  mm.; K,  $84\frac{1}{2} \times 89$  mm.; H, automatic inlet valves; K, overhead mechanically operated valves; Schebler automatic carburetter; H, V belt; K, flat belt.

THE POPE MOTOR CYCLE AGENCY, 55, Banner Street, E.C.—There are three Pope machines on view, known as the K

Valve side of the  $3\frac{1}{2}$  h.p. Pope model K.

and H models. The H model is a 3 h.p. machine scaling 160 lbs., with an automatic inlet valve and Schebler automatic carburetter. Ruthardt magnetos are fitted. A free engine is obtained through the medium of a plate clutch on the engine-shaft. Another feature of both these machines lies in the triple head that recalls the Referee pedal bicycle of some years ago, the trussed forks being supported on the arm of a bell crank lever fulcrummed from the axle and controlled by a flat leaf nickel steel spring projecting forward from the fork crown.

In the K type a Ruthardt magneto and automatic carburetter are also employed, but the engine is designed with overhead valves closed by helical springs placed between the tappet and tappet spindle, the latter being adjustable.

The greatest departure from British practice is the flat  $1\frac{1}{2}$  in. belt drive. A plate clutch is mounted on the engine pulley. The lever which operates the clutch is provided with a bell crank arm having a spring-mounted jockey pulley at its end.

When the lever is in the mid position it brings the clutch only into action, further forward movement causing the jockey pulley to bear on the belt and tighten it. The chain pedal drive is adjusted by an eccentric on the pedal crank bracket. The cylinder is off-set, and the gudgeon pin is secured to the connecting rod by a taper lock nutted bolt, and rocks in bearings on the bosses of the piston.

**PREMIER, No. 111.**

$2\frac{1}{2}$  and  $3\frac{1}{2}$  h.p. MODELS:  $73 \times 66$  mm. and  $85 \times 88$  mm.; m.o. side by side valves; Brown and Barlow carburetter; belt and combined belt and chain; Premier two-speed counter-shaft and Armstrong three-speed hub.

THE PREMIER CYCLE CO., LTD., Coventry.—The  $2\frac{1}{2}$  and  $3\frac{1}{2}$  h.p. machines on this stand demonstrate various methods of transmission. On the  $3\frac{1}{2}$  h.p. T.T. machine the firm have an example of fixed drive, while a belt drive is used

either in conjunction with an Armstrong three-speed hub, free engine, or direct. A fine example of the  $3\frac{1}{2}$  h.p. is fitted with the Premier two-speed counter-shaft gear, which involves chain transmission from engine to gear box, belt from gear box to back wheel, and in this the 8 in. belt pulley which drives to the back wheel is of a new pattern, adjustable, and designed so that its own driving gives it a tendency to self-locking, while the turning of a large diameter nut unlocks it. A striking feature about this machine is the width of the back mudguard, which is about 7 in. wide. It can be swung clear for tyre repairs. The arrangement of the engine in the frame is exceptionally neat. The water-proof Bosch magneto placed at the back

**The Olympia Show.—**

of the cylinder is gear-driven, and a Brown and Barlow carburetter supplies the mixture. The auxiliary exhaust

Premier pedalling gear bracket, brake rod carrier, and connections.

ports that have for so long formed a feature of the Premier design are, of course, retained, the exhaust from them being led by a pipe to the silencer.

Section of the 3 h.p. single-cylinder Premier engine.

always in mesh. The oil pump is incorporated in the tank, and in this tank the spring filler caps of last year are retained. New features, however, are seen in the front wheel stand, which also acts as the lower mudguard stay, in the neat fitting of the toolbox, and in the spring-up stand at the back.

Section of Premier two-speed counter-shaft gear with enclosed plate clutch and adjustable pulley.

In the counter-shaft model, the chain is exceptionally neatly enclosed, and in the single-cylinder belt-driven type a neat aluminium protecting device is carried over the belt pulley.

The firm also have on their stand an example of the 7-9 h.p. engine that they are fitting for sidecar work. This is an 85 x 88 mm. twin, and the exceptional size of the crank discs should give exceedingly steady slow speed running. A notable point, too, is the quick detachability of the inlet pipe from the cylinder.

New twin Quadrant sidecar machine. It has two speeds, chain drive, and handle-starting.

**QUADRANT, No. 46.**

7 h.p. MODEL (twin-cylinder, V type): 87 x 95 mm.; overhead inlet valves, m.p.; B. and B. carburetter; chain; two-speed gear.

QUADRANT Co., Lawley Street, Birmingham.—This fine sidecar machine is the attraction on the Quadrant stand. The engine is well up to its work and is an entirely new design with the magneto built, and the chains have neatly decarried at the rear. The frame is sturdily signed guards. The gear is mounted in the counter-shaft, and is of the selective clutch type, whilst handle starting is provided. Underneath the left footboard a long silencer of big capacity is located. A new form of spring fork makes its first appearance.

Single-cylinder models, on much the same lines as the twin, but with belt drive, are also exhibited. One is pleased to note that the Quadrant retains the excellent characteristic of a smooth crank case, rendering the cleaning operation much more simple, and, generally, the new Quadrants appear very workmanlike designs. They embody up-to-date practice throughout.

**REX, No. 92.**

4 h.p. MODEL (single-cylinder): 84½ x 95 mm.; side by side valves; Brown and Barlow carburetter; belt; Rex two-speed gear.

THE REX MOTOR MANUFACTURING CO., LTD., Coventry.—Several interesting features are incorporated in the new design. A new and neatly shaped tank is fitted which has a particularly clean appearance since there are very few fittings. It is supported from below by

lugs brazed to the frame. The petro filler has a glass cap which serves, also, as a level indicator, and with the oil filler cap is incorporated an air pressure pump. With a few strokes of this pump sufficient air pressure can be obtained in the tank to feed oil through an adjustable sight-feed drip for a considerable period. The frame is not much altered, but a somewhat stronger steering head is now standard, an interesting feature being the handle-bar lug, which is keyed and bolted to a solid steering pillar, and is clipped to the bar itself so that the

6 h.p. Rex twin-cylinder side by side valve engine.

passing through a ring fixed to the tank. The well-known cantilever saddle suspension is, of course, still used. The rear portion of the frame is detachable and carries the Rex two-speed gear, which is made under Roy licence. Footboards are fitted, and the mudguarding has been

**The Olympia Show.—**

well carried out. The belt guard deserves special attention, as it is carried round the driving pulley and extends backwards below the belt almost to the rear hub; it has, also, a side member which protects the belt from any mud

6 h.p. MODEL: 76 × 85 mm.; side by side valves; B. and B. carburetter; belt; Rex two-speed hub gear.

This machine is fitted with a Rex cantilever saddle-pillar. A guard is placed below the belt to protect it from wet and mud. Sidecar lugs are permanent attach-

tank. The clutch is controlled by a pedal on the left-hand side, while a similar pedal on the right brings into action an expanding brake in the hub. A band brake is fitted to the front wheel. Saxon forks and Hutchinson tyres are standard. Two of these machines have sidecars attached, one of which is fitted with an excellent Cape cart hood. A third is combined with a tradesman's carrier. The lubrication is by Best and Lloyd pump and drip feed. The mudguarding is efficiently carried out.

**ROVER, No. 86.**

3½ h.p. MODEL: 85 × 88 mm.; side by side; B. and B. carburetter; belt; Armstrong VI

THE ROVER CO., LTD., Coventry.—The chief alteration to the Rover model lies in the tank, which has rounded edges, and is also sloped away towards the rear. The oil tank is a steel pressing let into the main tank so as to form an absolutely unbreakable joint. A plain tapless pump and large glass-topped filler caps are fitted with a gauze strainer inside each.

The frame now has a dropped top tube, but in other respects remains unaltered. The front mudguard has side flaps extending to the fork head, and the rear guard has side extensions for both belt rim and brake rim. The foot brake is placed above the chain stay instead of below, and the leverage somewhat increased from the pedal. The carrier is particularly large, and the pannier toolbags are protected on two sides by steel plates. A new silencer is fitted which is circular in shape and lies underneath the bottom bracket. For this reason it is necessarily somewhat short, but the diameter is very considerable. From this expansion chamber a pipe leads back to a point near the rear hub, and in actual practice the exhaust is extremely quiet.

Except for these fittings the Rover machine is little altered.

A similar model can be obtained either with a free engine, which is of the Triumph type, and made under licence by the Rover Co., or with a fixed gear.

A Tourist Trophy type is also manufactured which is on the same lines throughout, but has a shorter wheelbase,

Open frame 6 h.p. belt-driven Rex.

which might drip off the rear guard. This model may also be obtained with a fixed gear or the Rex hub cone clutch.

6 h.p. MODEL (twin): 77½ × 95 mm.; side by side valves; B. and B. carburetter; belt; Rex two-speed gear.

With the exception of the twin-cylinder engine this model is similar to the 4 h.p. Both types have sidecar lugs made with the frame. The latter model may be obtained with a specially low frame suitable for a lady. In this case the oil tank is separate and lies across the frame just in front of the saddle-pillar. The description and illustrations of this frame will be well remembered by readers of this journal. A sidecar is shown which was described in a recent issue. It has four points of attachment and a specially strengthened frame, also auxiliary coil spring suspension.

The 6 h.p. chain-driven is similar to the belt-driven models, with the exception of the transmission, which is well protected from mud. A 4 h.p. lady's model, with open frame, was expected on the stand, but had not arrived at the time of our visit.

**REX-JAP, No. 68.**

3½ h.p. MODEL: 85 × 85 mm.; overhead valves; B. and B. carburetter; belt; Sturmev-Archer three-speed hub gear.

THE PREMIER MOTOR CO., Aston Road, Birmingham.—The mudguarding of this increasingly popular machine is very well carried out. Front and rear stands are fitted. The inflator, which is of a commendable length, is attached to the stays of the spring forks which are of Druid pattern. Instead of a petrol gauge the filler cap has a glass top

ments, covered with caps. Kempshall tyres are a standard fitting. Several sidecars are shown with coach-built and cane bodies, two of which are attached to Triumph bicycles. One sidecar chassis has a dropped frame to admit of a low position.

**ROLFE, No. 71.**

6 h.p. MODEL: 76 × 85 mm.; side by side valves; Amac carburetter; Rolfe three-speed in counter-shaft; chain.

THE ROLFE MFG. CO., LTD., Smethwick, Birmingham.—These powerful looking machines are fitted with twin Precision engines. The counter-shaft three-speed gear, with which is incorporated the kick starter, is operated by a convenient lever on the right side of the

The new Rover sidecar which will be sold complete in 1913. The sidecar wheel has a band brake.

**The Olympia Show.—**

fixed gear, and the usual T.T. fittings. A special sidecar chassis is made by the company, one of the chief features of which is a band brake on the sidecar wheel. This is connected to a pedal on the bicycle and is compensated with the rear motor cycle brake. The chassis is low and the body has a pleasing appearance.

The magneto is handle-bar controlled, and lies well out of the way of mud and dust. The excellent finish and workmanship of Rover machines are too well known to need our praise.

**RUDGE, No. 93.**

3½ h.p. MODEL: 85 × 88 mm.; mechanical valves, overhead inlet; Senspray carburetter; Rudge-multi gear; belt.

**RUDGE-WHITWORTH, LTD., Coventry.**—Eight splendidly-finished machines are exhibited on this stand. Also an excellent display of parts; these are mounted on boards. The arrangement of these parts is an excellent way of showing visitors the various details of the Rudge-Whitworth machines. For example, the parts of the multi hub and gear, piston, connecting rod, timing gear, roller bearings fitted to connecting rod and starting gear, are all shown in this manner. There are also neat enamelled iron stands on which are fitted engines in part section, the cylinders being cut away to show such parts as the piston, rings, valve ports, etc. The timing gear cases are also cut away to show the timing gear wheels, magneto drive, and arrangement of cams. Visitors who examine these should take particular note of the magneto transmission gear wheel attachment to armature-shaft. There is a very fine adjustment for the magneto timing by means of serrations or fine flutings on shaft and wheel. The latest device should prevent any possible chance of the washers working off the end of the shaft. Projections are cast on the inside of the aluminium cover plate; these do not touch the washers when the shaft is revolving unless there is a tendency for them to work endwise, when the projections immediately prevent any further movement.

One of the stands carries an engine fitted up with the Multi-gear expanding pulley and clutch, also the lever for operating same, and a portion of a handle-bar with Bowden control for the clutch. The outside of the pulley is cut away to show the clutch plates, spring, etc., so that by moving the gear-operating lever and clutch lever the visitor can see for himself exactly how the gear works. Still another stand shows the whole power unit, but with the clutch only. Another little detail improvement which has not been previously mentioned is the spring-fitted lid to the tank fillers. The lid is rectangular, and by means of two springs—one a coil spring anchored to the inside of the tank—the lid can be turned back and will remain in that position until it is partly lifted up with the finger, when the spring automatically shuts it and holds it in the closed position.

Two Rudge-multi models driven by electric motors show the operation of the gear in an excellent manner, which any amount of demonstrating by word of

mouth could not improve upon. Moving the connecting rod of the sample crank case, flywheels, and connecting rod, which have been fitted up to show the easy running of the roller bearings, proved to us that Rudge-Whitworth, Ltd., have left no stone unturned to provide efficiency.

The free-engine model is provided with a spring end cap to the clutch cover, so preventing any oil being blown out on to the rider's feet. Caps are fitted to the centre of the cylinders, allowing 1½ in. hole when removed. This is done to facilitate the casting of the cylinders. At the same time it allows a big opening through which one of the scrapers sold for cleaning off carbon deposit can easily be inserted. The finish of these machines should be particularly noted: the celluloid covered handle-bars give the machine a very handsome appearance and match excellently the fine enamelling of the frames.

5-6 h.p. SIDECAR MODEL: 85 × 132 mm., 750 c.c.; mechanical valves, overhead inlet; Senspray carburetter; Rudge-multi gear; belt.

The latest addition to this long-stroke model is the fitting of the 500 c.c. exhaust valve spring to the inlet valve. The flywheels have been increased in weight, and the cams have been redesigned to give the necessary increased opening for the passage of the greater volume of gas. The connecting rod has the same roller bearings as the 500 c.c. engine.

The sidecar chassis is made up of straight tubes throughout, and is particularly well attached to the bicycle. In addition to the usual front and rear attachments, further security is provided by clipping the inner frame member of the sidecar to the footrest tube. To arrive at a straight tube design the chassis is dropped so that the connecting tubes need not pass underneath the sidecar body. A diagonal tube connects the outside tube with the one nearest to the bicycle which greatly strengthens the chassis. At the rear is a strongly-made luggage grid, and the mudguard is particularly well stayed to the frame. A double bracket is provided for lamp and generator. The sidecar wheel is very strong laterally, being built with wide flanges. The wheel is enamelled black all over and fitted with a 26 in. × 2½ in. tyre.

The body is coachbuilt. upholstered in

green pegamoid, and painted to match the Rudge finish on the tanks, i.e., aluminium with broad green lines. The apron is a particularly practical and neat idea. It folds in such a way that it can be used as either an ordinary apron or a storm apron, but when folded the eyelets of the storm apron fit over the turn buttons provided for the ordinary apron so that it is not necessary to fold up a detachable portion and carry it under the seat. At the front of the apron is a little draught excluder, which prevents wind blowing underneath.

The Rudge machines have come to the fore in a surprising manner, and a visit to the company's stand will confirm our good opinion of the workmanship and material used in their construction.

**SERVICE AND W.D., No. 17.**

3½ h.p. MODEL: 85 × 85 mm.; side by side m.o.i.v.; B. and B. carburetter; Armstrong three-speed gear.

**THE SERVICE CO., LTD., High Holborn, E.C.**—This is a well-built, well-designed touring model, following standard lines throughout.

3½ h.p. W.D. MODEL: Overhead inlet valve; B. and B. carburetter; belt; single gear.

This machine, which is shown by the Service Co., made its first appearance last year, and has not, we understand, been materially altered. Its chief feature is the very excellent system of lubrication employed, in which, we may remind our readers, a large sump is fitted to the bottom of the crank chamber, from which oil is taken by pump and delivered under pressure through the hollow crankshaft to all the bearings.

There are also shown on this stand a 3½ h.p. Triumph, 2½ h.p. Douglas, 6 h.p. Rex, 3½ h.p. Rudge, and 3½ h.p. Dot.

**SCOTT, No. 117a.**

3½ h.p. MODEL: Two-stroke valveless twin; Scott carburetter; chain; two-speed counter-shaft gear.

**GODFREY AND APPLEBEE, Great Portland Street, W.**—By arrangement with the Colmore Depot, who agreed to give up their stand to Godfrey and Applebee, visitors to the Show will be able to see the winning Scott in the Tourist Trophy Senior Race. In general appear-

New chain driven Rex, 6 h.p. twin, with two-speed gear and spring seat.

**The Olympia Show.—**

ance the 1913 Scott is exceptionally neat. The modifications in design are chiefly those of detail, the most noticeable being the system of encasing the transmission in sheet aluminium guards, and the finish of the exterior of the petrol tank in Rexine, which gives a very pleasing appearance. The principle of the two-stroke Scott engine, with its crank case compression, is well known, but we may point out that, although it has the appearance of being water-cooled, the jacket is not carried over the heads of the cylinders, which are air-cooled, as this arrangement has been found to give higher engine efficiency than if entirely water-cooled. In the gear the wearing surfaces are larger, and a great improvement has been introduced in the design of the counter-shaft, by which the chain sprocket driving to the back wheel can now be removed without taking down the counter-shaft. This is effected some-

portant feature of the engine is the fact that the head which carries the valves is screwed into the top of the cylinders.

**SINGER, No. 79.**

2½ h.p. MODEL: 69 × 80 mm.; side by side; B. and B. carburetter; belt.

SINGER AND CO., LTD., Coventry.—There is a very attractive display of motor cycles on this stand, one being a lady's machine, another a T.T. model, while a third is fitted with a Villiers free engine hub clutch. The Bosch magneto is carried in front of the engine and controlled from the handle-bar. The lady's model is fitted with the Singer two-speed counter-shaft drive, the drive from the engine to the counter-shaft being by gear and thence to the back wheel by belt. Druid forks, Middlemore saddles, and Dunlop tyres are standard. The control wires of the two-speed machines are carried in metal tubes above the handle-bars.

Moto-Reve new twin model with chain drive and two-speed gear.

what on the divided shaft principle, merely by withdrawing a bolt and washer at the left-hand end of the shaft. Of course, chain transmission is used, and the clutch works on the expanding ring principle, but these details embody no new features. Another feature, not new, but worth mentioning, is the simplicity of the method by which the front of the footboards is supported on small flat springs, while the support of the footboards at their back end renders them instantly detachable. The waterproof Bosch magneto is chain driven off the counter-shaft as before. Silent as the Scott machines certainly are, the 1913 model has been made quieter still by a small expansion chamber fitted at the end of the exhaust pipe. It should be mentioned that the actual machine upon which F. A. Applebee, jun., won the Senior T.T. Race, as well as its rider, are to be seen on the stand.

**S.I.A.M.T., No. 23.**

2½ h.p. MODEL: 68 × 72 mm.; overhead valves; S.I.A.M.T. carburetter; single gear; belt.

L. N. PALMER AND CO., 9a, Trevelyan Road, Tooting, S.W.—The two machines shown on this stand are identical with the new models described on page 1333 of our issue of the 21st inst. An im-

3½ h.p. MODEL: 85 × 88 mm.; side by side; B. and B. carburetter; belt.

This machine is shown single-g geared, and also fitted with the Armstrong three-speed hub. The saddle is a Brooks pan seat. It will be remembered that upon this make Stanley recently annexed the hour record.

4½ h.p. MODEL: 88 × 95 mm.; side by side; B. and B. carburetter; gear and belt; Singer two-speed.

This machine is most suitable for sidecar work. The gear is operated by a lever which is attached to the tube below the tank. The footboards are of cast aluminium. Pedals are provided for starting purposes geared direct to the engine by a chain. The carrier with the back mudguard will turn back on the removal of a bolt. The Singer machines are provided with neat valve covers, having an extension to protect the riders' clothes from the heat of the engine. These are made of aluminium.

The Singer sidecar has a special low frame with an extension at the back for luggage carrying. The springing is decidedly novel, being by means of spiral springs working in metal cylinders. A Turner sidecar is attached to one of the machines.

**SPARKBROOK, No. 99.**

6 h.p. MODEL (V twin): 76 × 85 mm.; m.o.v. side by side; B. and B. carburetter; Sparkbrook two-speed counter-shaft gear; chain and belt.

SPARKBROOK MFG. CO., LTD., Coventry.—This old-established pedal cycle firm with an excellent reputation enters the motor cycle lists for the first time at this Show. The only model exhibited is a 6 h.p. sidecar, with the firm's own two-speed gear on counter-shaft. This is of the dog clutch type, and operated from a lever on the top tube. The gear ratios are 4½ to 1 high and 7½ to 1 low. The drive is by 5in. pitch roller chain from engine to counter-shaft, thence by 1in. belt on 8in. pulley to rear wheel belt rim. A free engine clutch is contained in the counter-shaft pulley. The front forks are of Sparkbrook design manufactured under the Druid patents. The tank is carried on brackets brazed to the lower frame tube, and lubrication is by sight feed and pump. The frame is built up with lugs suitable for quickly attaching the sidecar. The sidecar has a coach-built body luxuriously upholstered with spring cushions on back and seat; the body is suspended on wide C springs, and a tubular luggage carrier is attached at the rear of the chassis. The wheels are 26in. × 2½in. with extra heavy Dunlop tyre on the rear wheel.

**STAR, No. 83.**

4½ h.p. MODEL (single): 87½ × 100 mm.; side by side valves; multi-jet carburetter; chain; Star three-speed gear.

THE STAR CYCLE CO., LTD., Wolverhampton.—This machine is quite a new comer, possessing several rather unusual features. The frame has a dropped top tube and a curved front down tube. Saxon front forks are supplied, and both wheels are carefully mudguarded. The tank is tapered fore and aft, and has rounded sides. Lubrication is semi-automatic. Both petrol and oil taps are of the needle valve variety. The handlebars are distinctly unusual, having a very sharp drop to provide a natural position for the hands, and flats to accommodate the Bowden control for carburetter and magneto. From the levers the wires are led inside the handle-bars, which gives the machine a neat appearance. The engine has many original features. The valves lie in large chests, which have an air passage all round. The cylinder head is detachable, and held on by four long bolts. The valve gear is enclosed by an aluminium cover, which grips the tappet guides and renders the valve gear oil-tight and dustproof. The carburetter is made by the company to suit their own machines. It is on the multi-jet principle, and has a variable choke tube. It is of the automatic variety, and draws its supply of air from an aluminium casting which encircles the cylinders, and, consequently, warms the mixture. The magneto lies behind the cylinder, and is driven by chain. A curious feature is that the oil is led into the magneto chain case. The system of lubrication is so arranged that the oil, having run from the chain case into the timing gear, is led

**The Olympia Show.**

into oil flingers, which, by centrifugal force, carry the oil into the crank pin, a lead being taken through the connecting rod to the gudgeon pin and cylinder walls. A simple form of decompressor is combined with the exhaust lift. A leather-to-metal cone clutch is mounted on the engine-shaft, and transmits the power by means of a chain to the gear box. This box is of the sliding gear type, similar to car practice, a direct drive being obtained on top. The driven sprocket is fitted with a spring-controlled shock absorber, which removes the harshness from the drive. The gear box is bolted to the bottom bracket, ample allowance being made for chain adjustment, and the final transmission is by chain to the rear wheel. Careful provision has been made for protecting both chains from mud and wet. The operation of the change-speed is by a lever working in a quadrant bolted to the top frame tube. A neat enclosed kick starter is attached to the gear box, and rubber-covered footboards, which are sprung at the rear, are fitted. The rear brake is unusual in that it acts on what may be termed an inverted belt rim; that is to say, the bottom of the V is on the outside periphery. Pannier toolbags are fitted, and the rear forks and chain adjustment are particularly solid. A very large expansion box is placed in front of the engine with the exhaust gases escaping through a long pipe with a specially flattened end. The whole machine is of unusual construction, and is calculated to attract a good deal of attention. Two attractive models of the Turner sidecar are shown on this stand; both models are built specially to suit the Star machine.

**SUN, No. 90.**

3½ h.p. MODEL (single-cylinder); 85×88 mm.; side by side valves; B. and B. carburetter; Sturmey-Archer three-speed; belt.

THE SUN CYCLE AND FITTINGS CO., LTD., Aston Brook Street, Birmingham. —Although this model is not entirely new this is its first appearance at Olympia. One notices at a glance that the finish throughout is excellent. There are no very special features, the frame being of the standard dropped tube type and fitted with Druid forks. All frame fittings are cossetted. The tank has neatly rounded edges, and is fitted with large filler caps, lubrication being effected by enclosed hand pump.

Both front and rear guards have short side flaps, and a stand is fitted to each wheel. A neat petrol sump combined with a strainer is placed between the tank and the petrol pipe, while pedalling gear is fitted as standard. The carrier is of the usual type, having pannier toolbags and giving ample accommodation for luggage. A pan saddle is fitted. A very neat clip for Bowden cables is placed under the tank; it consists of a metal trough, which slides in grooves fixed to the base of the tank.

The above description is correct for all Sun models, which are made with the following sized engines: 4 h.p., 85×85 mm., and 4½ h.p. 90×96 mm. (either of these models may be had with Villiers free engine or fixed gear); 2½ h.p., 70×90 mm.; and 2½ h.p., 70×76 mm. Each model is fitted with an efficient magneto guard and silencer.

D16

**POWER UNITS OF SHOW MODELS.**

Power unit of the new 3½ h.p. Swift, from the valve side.

Chain side of the 2½ h.p. Sunbeam power unit.

The foot brake is mounted separately from the footrest on the Monopole.

**SUNBEAM, No. 64.**

2½ h.p. MODEL: 75×79 mm.; side by side valves; Amac carburetter; chain; Sunbeam counter-shaft two-speed gear.

JOHN MARSTON, LTD., Sunbeamland, Wolverhampton. —There are several examples of this beautifully finished machine, which we described in our issue of November 14th, page 1315. Naturally a special point is made of protecting the chains. Incidentally, it may be remarked that the same guards also protect the variable gear and clutch.

The tank, which is finished in black and gold, is firmly supported on brackets. The lubrication is by pressure fed pump. The inlet tube is tapered, the larger end being towards the engine. This is said to improve the carburation.

Front and rear stands are fitted. The back mudguard can be turned back bodily to allow of tyre repairs. The handle-bar is enamelled black. Mention has already been made of the back axle, which is divided to allow tyres to be changed without the removal of the wheel. Comfortable footboards are standard equipment.

**SWAN, No. 53.**

3½ h.p. MODEL: 85×85 mm.; side by side m.o.v.; Senspray carburetter; two-speed gear; chain.

CYGNUS MOTORS, LTD., Frodsham. —The Swan motor cycle possesses a number of highly interesting and valuable features. Its makers claim that it was one of the first machines in which a deliberate effort was made to enclose as much as possible the transmission and to provide a satisfactory form of spring frame.

Although it has an unconventional appearance, no one can possibly deny its thorough practicability.

The frame, instead of being tubular, has no top bar, but consists of a chassis of stout aluminium plate strongly riveted and bolted together. At each side of the two side members are comfortable rubber-covered footrests. The engine is placed well forward, with the top of its crank case level with the top edges of the frame members, and this allows an aluminium plate to be clipped on so as to leave only the cylinder projecting. The crankshaft carries a leather-faced cone clutch, on an extension of which is fitted a hand starting device operated by a long lever. The gear box is of the positive or dog clutch type and is placed at the rear of the engine and driven by a chain, the final drive being also by chain.

The gear control and also the clutch control are on the right-hand grip handle, both being worked through Bowden wires. The Mea magneto is placed immediately over the gear box and driven by two chains and a small counter-shaft. A powerful heel brake working on a special brake rim is fitted. The tank is immediately underneath the seat, which is of a new and very comfortable type. Suspension of the frame consists of two long leaf springs working in conjunction with pivoted chain stays, which are mounted on ball bearing trunnions. A J.A.P. drip feed lubricator is fitted to the small oil tank, which is under the steering head of the frame.

## The Olympia Show.—

**SWIFT, No. 100.**

3½ h.p. MODEL (single) : 86 × 85 mm. ; side by side valves ; B. and B. carburetter ; belt ; Armstrong three-speed gear.

THE SWIFT CYCLE CO., LTD., Coventry.  
—The new Swift models are characterised by their simplicity and clean design. The

Pulley side of Swift engine. This picture shows the brake pedal on the T.T. model, also handle-bar controlled magneto advance.

engine has large valves and adjustable tappets, and the cylinder holding-down bolts are extremely accessible. A neat and very simple half-compression device is fitted to the timing gear and operated by a small pedal. The machine has a dropped frame which gives a very low riding position.

Two pairs of footrests are fitted, the front pair being radially adjustable. The tank is supported on lugs attached to the bottom rail. It has large filler

Rear wheel of 3½ h.p. Swift, showing kick starter mechanism, carrier, and stand clip.

cups and a combined petrol sump and strainer. Semi-automatic lubrication is used. An enclosed Bosch magneto is fitted in front of the engine and driven by chain. Ample clearance is allowed in the chain case to prevent rubbing.

The hand brake is a particularly neat and simple piece of work, and the arch to which the shoes are attached slides in guides brazed to the fork. One model shown is fitted with B. and B.

automatic carburetter, and handle-bar controlled magneto is standard throughout.

Mudguarding has been carefully studied, and in addition to side flaps running the full length of the front guard a large splasher is fitted to the front wheel stand. The rear guards have a wide extension covering the belt and rim.

A kick-starter is fixed to the back stay and connected to the hub by means of a short chain.

A fixed gear model is also shown and T.T. models with both fixed gear and Armstrong three-speed gears. The pannier toolbags are protected by steel shields, which are carried round three sides of the bag, and a Reflex rear light is fitted to all models.

**STELLAR, No. 118.**

6-8 h.p. MODEL : 78 × 82 mm. ; valveless ; Amac carburetter ; two-speed sliding gears ; worm and propeller-shaft.

NYE AND Co., Hampstead Road, N.W.  
—One of the finest examples of the influence of car practice on motor cycle design is to be seen on the Stellar machine exhibited by this firm. In this the two-stroke engine, flywheel, clutch, and two-speed sliding gears are incorporated in a single unit construction, in which the crank case is extended and enlarged to cover the flywheel, and the gears are contained in a casing bolted to the crank case. The Bosch magneto of the enclosed type is carried at an angle on the right-hand side of the gear box, and driven by the extended engine-shaft through a Coventry silent chain. Where the engine-shaft extension projects at the back of the gear box, a free-wheel pinion is fitted, and this, in mesh with a quadrant on a pedal-operated lever, gives the necessary kick-starting facilities. The engine utilises compression from the crank case, and a 40-plate clutch transmits power to the gear box. Thermo-syphon cooling is used, and the gear is operated from the lever on the left-hand side. The machine is equipped with a front-wheel rim brake, and one working inside a special U brake rim on the back wheel.

**T.M.C. AND WOOLER, No. 22.**

7 h.p. MODEL (four-cylinder) : 60 × 60 mm. ; side by side m.o.i.v. ; Stewart - Precision carburetter ; three-speed sliding gear ; bevel.

WILKINSON T.M.C. Co., LTD., Southfield Road, Acton, W.—This ambitious sidecar machine, which has a four-cylinder water-cooled engine, the cylinders being cast separately, remains practically unaltered. Since last shown at Olympia a modified form of radiator has been fitted. The design of the hand-

The front rim brake on the Swift. Notice that the brake itself is carried outside the guard to prevent mud splashing.

starting device has also been amended, and side extensions to the front mudguards added. The magneto drive is now flexible, a fibre disc being interposed between the two cheeks of the coupling, pins from each side engaging with holes in the fibre disc. The gear ratios have also been altered, and now are 4.6, 6.7, and 11.8 to 1.

2½ h.p. MODEL : 76 × 76 mm. ; two-stroke ; B. and B. carburetter ; expanding pulley gear ; belt.

The Wilkinson T.M.C. Co. are fortunate in having two machines which are a refreshing departure from standard, and both are attracting much attention at the Show. In addition to the four-cylinder just described is another interesting model, viz., the horizontal engined Wooler, which first made its appearance at Olympia last year.

The engine is of the two-stroke type, and possesses a blank-ended cylinder and a double-ended piston with one ring on the displacing end and three on the firing

The Stellar two-stroke twin, a machine of clever design.

**The Olympia Show.—**

end. Each end of the cylinder is connected by an external pipe with valves at each end, while the exhaust is effected by a port in the lower side of the cylinder walls. The crankshaft is now hollow. The lubrication is by pump, which delivers oil to the cylinder and drips oil on to the connecting rod and on to the big-end. In the sump, a lubricating oil injector is fitted into the filler cap, thus enabling oil to be injected to any moving part in the mechanism which may require it. The pulley is slightly under-geared, thus allowing it to be of ample dimensions. The back wheel is suspended on coil springs while we may also mention an ingenious device for tightening the belt. The pulley is free to swing backwards and forwards, pivoting on the crankshaft centre thus allowing the slack of the belt to be taken up when the lower gear is in engagement. This slides through an adjuster, which controls the limit of movement and allows the belt stretch to be taken up. The streamline tank and efficient system of mudguarding also call for attention. All control wires are enclosed, running through the handlebar and then through tubes to the carburetter. It is also interesting to note that the brake rod works through one of the frame tubes and is an exceedingly neat fitting. Detachable wheel spindles are fitted to both front and rear wheels—a great convenience.

**TORPEDO, No. 82.**

2½ h.p. MODEL: 70 × 76 mm.; S.S.; B. and B. carburetter; Armstrong three-speed hub; belt.

F. HOPPER AND CO., LTD., Barton-on-Humber.—This little machine is also shown fitted with the B.S.A. free engine. The Best and Lloyd system of lubrication is adopted. The toolbags are carried pannier fashion in metal brackets.

3½ h.p. MODEL: 85 × 85 mm.; S.S.; B. and B. automatic carburetter; Armstrong three-speed hub; belt.

Except in size, this model is similar to that already described. Front and rear stands are fitted. The finish of these machines is exceedingly good.

New Torpedo sidecar with frame around the wheel. The special design of mudguard will be noted.

4½ h.p. MODEL: 89 × 96 mm.; S.S. B. and B. carburetter; Armstrong three-speed; belt.

This is essentially a sidecar model, and is shown with a Torpedo sidecar attached. The sidecar chassis has a dropped frame. The axle is supported on both sides, and the sidecar wheel is well protected. All the Torpedo machines are fitted with Precision engines, Druid forks, and Lycett or Empire-de-Luxe pan seats.

**TRIUMPH, No. 49.**

3½ h.p. MODELS (clutch, T.T., and three-speed): 85 × 88 mm.; side by side m.o.i.v.; belt.

TRIUMPH CYCLE CO., LTD., Coventry.  
—The Triumph stand is always a centre

New form of silencer on 1913 Triumphs. The only outlet is at the fishtail end of extension pipe.

of interest. At this year's Show there are six types of machines submitted for examination, all possessing the same type of power unit, viz., a 3½ h.p. engine of 85 × 88 mm., with interchangeable valves, which has now had such a long trial and has emerged triumphantly. All the different models are exquisitely finished. The three-speed machine possesses the most departures from previous Triumph practice. First and foremost, a change-speed gear has been adopted as standard for the first time. The one selected is the Sturmey-Archer, but it is controlled by a patented form of gear lever. This lever is much longer than the usual change-speed device on motor cycles, and is attached to the tank tube immediately behind the cylinder, where the ball head of the lever is conveniently placed for the rider's right hand. A ratchet and pawl device on the other side is neatly covered in to exclude wet and dirt, which would cause the gear to work stiffly. The change of speed is effected with the greatest of ease, and the ratchet prevents the possibility of one gear being accidentally slipped, which is a not infrequent occurrence with the ordinary type of lever. Other new features of the latest Triumphs are a new form of silencing arrangement in which the ordinary silencer is used as an expansion chamber, a long pipe extending behind the rear hub conveying the gases to the rear. A clock dial petrol gauge is now used, the advantage of which is that the rider may observe how much petrol there is in the tank as he rides along. The front mudguard is of en-

tirely new design. It is flattened out at the lower end, and on account of its width and special design, is found to be so efficient that the ordinary waterproof cover over the magneto has been dispensed with. On the clutch model the operating rod is connected almost at the top of the toe and heel pedal, which has the effect of gearing down the movement of the rod. Thus it will be gathered that a very gradual engagement for the clutch is possible. The foot brake rod is of flat section and arranged on the inner side of the engine pulley, whilst the pedal is much longer than formerly, giving a great deal more leverage. Minor improvements have been made to the engine. The adjustable tappets with en-

closed springs are retained, but one of the best points is the new leather washer on the crank case to prevent the escape of oil. The washer in question is held in position in the special recess of the crank case by a left-hand threaded nut. The washer itself being shaped in such a way that it tends to grip the engine-shaft. Plug fouling is said to be almost unknown with the new Triumph, the reason being ascribed to a modification of the design of the valve ports. As regards the carburetter, this now has a gauze cover over the extra air inlet, which is found greatly to economise petrol, besides excluding a certain amount of dust from being drawn into the engine. The magneto contact breaker is now controlled by a neat lever on the left handlebar on all models. A T.T. model with a hub plate clutch is a new departure, as also a simple decompressor. This machine, and the three-speeder, are the additions to the Triumph range.

**TRUMP-JAP, No. 40.**

3½ h.p. MODEL: 85 × 85 mm.; m.o.i.v., side by side; Senspray carburetter; belt; Sturmey-Archer three-speed gear.

TRUMP MOTORS, LTD., John Bright Street, Birmingham.—This machine was dealt with in our last issue, page 1329. It is a machine built on standard lines, fitted with Sturmey-Archer three-speed gear and kick starter, front mudguard with wide extensions, a wide tank with exceptionally large filler caps, and is altogether a sensible tonning mount.

**The Olympia Show.—**

3½ h.p. MODEL (twin-cylinder): 60 × 76 mm.; m.o.i.v., side by side; Amac carburetter; belt; Sturmey-Archer three-speed gear.

This machine strongly resembles the 3½ h.p. which we have just referred to.

6 h.p. MODEL: 76 × 85 mm.; m.o.i.v., side by side; Amac carburetter; belt; Sturmey-Archer three-speed gear.

This machine has Garrard-Maxfield sidecar fittings, and, in company with the other models referred to, has a specially strengthened head. A good feature of this machine is that the tool-bags are carried in metal frames attached to the carrier. The latter is provided with an additional stay, so as to give ample strength. Another feature is a special type of sidecar, the frame of which is underslung and fitted with a cane body.

**VICTORIA, No. 129.**

3½ h.p. MODEL: 85 × 88; side by side; B. and B. carburetter; belt.

VICTORIA MOTOR AND CYCLE CO., LTD., Dennistoun, Glasgow.—Victoria motor cycles are shown in different models. This make of machine is the only representative from Scotland. All have the different types of single-cylinder Precision engines, the 4½ h.p. machine with smart coach-built sidecar being the pick of an excellent array. There is nothing untried or experimental about the Victoria. It is on standard lines, with Druid forks, Bosch magneto, Dunlop tyres and belts, and Brooks saddles. It is built of substantial fittings, and is bound to give satisfaction. A choice of change-speeders or single-gear mounts is offered. The price, too, is an eye opener.

**WIN-PRECISION, No. 20.**

3½ h.p. T.T. MODEL and 3½ h.p. TOURING MODEL: 85 × 88 mm.; side by side m.o.i.v.; Armstrong gear.

WINGCYCLE TRADING CO., Great Saffron Hill, E.C.—The Win-Precision is a machine which follows standard lines and is built of the best material. On the stand is to be seen the 3½ h.p. machine used by W. J. Clarke on two unofficial long distance rides, one with and the other without a sidecar.

The folding sidecar, recently described on page 1338, November 21st, is shown fitted to a 4½ h.p. 90 × 96 machine with Roc two-speed gear.

All Win-Precision models are fitted with B. and B. carburetters and Druid spring forks. Another 3½ h.p. model is fitted with a Villiers two-speed gear in the rear hub.

**VELOCE AND WILTON, No. 123.**

3½ and 2½ h.p. MODELS: 85 × 88 mm. and 70 × 76 mm.; m.o. valves; B. and B. carburetter; belt; three speed and two-speed.

THE WILTON CYCLE AND MOTOR CO., Wilton Road, S.W.—The Wilton side-

Victoria-Precision sidecar outfit—the only Scottish representative in the Show.

**WILLIAMSON, No. 81.**

8 h.p. MODEL: 85 × 85 mm.; side by side valves; Amac carburetter; chain; Douglas two-speed countershaft gear.

THE WILLIAMSON MOTOR CO., Coventry.—These machines are shown in two forms—air-cooled and water-cooled. The engine is the now well-known Douglas 8 h.p. horizontally opposed twin. The two-speed gear is controlled by a lever attached to the top tube; the rear hand brake by a pedal for the right foot. The greater part of the frame is double. The Douglas adaptation of the Druid fork is fitted. The front mudguards should prove very effective. From the fork towards the front the side flaps lie in the plane of the wheel, but from the forks downwards they are turned out at right angles. The footboards are attached to extensions of the frame itself and not to crosspieces bolted on. The chain drive

is softened by a spring device in the back hub. The silencer consists of a long tube extending rearwards and flattened at the end. The Bosch magneto is controlled from the handle-bars. Large hinged filler caps are fitted, having glass tops. The saddle is Lycett's Le Grand. The machine is finished in black, the tank and chain guards being grey in colour.

cars are shown, in which the design enables the car to be secured to the frame at all points, and the fittings are such that by a single nut all the fixings at the back can be detached. The axle is dropped. Matchless, Clyno, and Veloce machines are displayed. The Veloce is made in two models—3½ and 2½ h.p. The machine depends upon belt transmission, while three speeds are available through the medium of an Armstrong hub gear. It is in the 2½ h.p. machine, however, that the chief features lie. In the engine of this machine the valves are placed in front, and, unlike its larger brother, the inlet is above the exhaust, and worked by an adjustable tappet. Lubrication is carried out automatically by means of a pump operated by rotary gear off the gear-shaft. The two-speed gear is contained within the crank case casting. An outside flywheel is adopted.

**WULFRUNA, No. 35.**

6 h.p. MODEL: 76 × 85 mm.; m.o.i.v.; Amac carburetter; chain.

WULFRUNA ENG. CO., LTD., Wolverhampton.—This is a serviceable machine designed for sidecar work. It is provided with

Toe and heel pedal controlling clutch of the G.H. gear on the twin Wulfruna sidecar machine.

Trump four-point suspension sidecar chassis.

**The Olympia Show.**

two-speed conpler-shaft gear. The change-speed lever is on the top tube, and the clutch pedal is on the right hand side of the gear box. The lubrication is by pump, and a petrol tank of large capacity is fitted. A special sidecar is shown attached to this machine. The weight of the machine solo is 240 lbs.

3½ h.p. MODEL: 84 × 89 mm.; side by side m.o.i.v.; B. and B. carburetter; chain; two-speed counter-shaft gear.

This model is similar in detail to the 6 h.p. just described, except that it is of smaller h.p., since a similar type gear and transmission are fitted. A machine of the same h.p. is the 3½ T.T., but this is provided with belt transmission and dropped handle-bars.

2½ h.p. MODEL: 77 × 81 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; Armstrong three-speed gear.

This machine is fitted with sloping footboards, carries the magneto behind the cylinder, and is provided with a special bracket for the back brake spindle which is brazed to the back forks. This feature is to be found on all models. This model, in conjunction with the other types, is provided with Armstrong gear and a starting device which can be operated either by the hand or foot; also worthy of mention is the fact that a special filter is provided at the petrol pipe union.

2½ h.p. MODEL: 76 × 65 mm.; overhead inlet valve; Senspray carburetter; Armstrong gear.

This model is provided with an engine of a totally different type from the others. The magneto, which is gear driven, is neatly carried on a platform behind the cylinders, and the design of the two-to-one gear casing is particularly neat. Footboards, kick or hand starting device, and Armstrong three-speed gear are fitted.

2½ h.p. MODEL: 65 × 70 mm.; side by side m.o.i.v.; B. and B. carburetter; belt; single gear.

This model is the smallest shown by the Wulfruna Engineering Co. The magneto is chain-driven and carried behind the engine. All models are provided with Druid spring forks and have side shields to the front mudguard.

With so many standard machines there is no lack of variety on this stand.

**ZENITH, No. 112.**

4 h.p. MODEL: 85 × 88 mm.; 6 h.p. twin. 76 × 85 mm.; 3½ h.p., 90 × 77.5 mm.; 2½ h.p., 85 × 60 mm.; all side valves, except racing—racing, overhead; B. and B. and Amac carburetter; all Gradua gear.

ZENITH MOTORS, LTD., Weybridge.—On the Zenith stand there are the following models: The Zenith Green, with

*The Motor Cycle.* The features of the latest Zenith designs may best be seen in the clutch model. The tank has been re-designed with corners rounded off, and is now carried on table lugs underneath, obviating the necessity for attachments to the top tube. A very useful detail, too, is seen on the combined sump and strainer placed at the bottom of the petrol tank. This is combined with the petrol tap.

A new model. The water-cooled Green-Precision engine on a Zenith Gradua.

water-cooled Green engine; the clutch model, fitted with kick starter, designed to give free engine on any ratio of the Gradua gear with which it is fitted; the standard 6 h.p., fitted with long separate plated exhaust pipes to each of its two

Rear fork end of the Zenith to enable the wheel to be readily detached.

cylinders, and cut-out at the rear in the back axle; the 3½ h.p. overhead valve racing model; racing models with single and twin cylinders, having overhead valves, the powers being respectively 2½ h.p. and 3½ h.p. for the singles, and 8 h.p. for the twins. All the machines are fitted with the special lug in front to take a sidecar, as already described in

Another very distinctive feature is the wide shield which protects the magneto and is carried outwards, also to protect the gear. This, it is claimed, has proved more effective than wide front guards, as, among other things, the engine is left far more open to air cooling.

Attention should be given to the careful side-guarding of the wheels, the mudguards of which are provided with slide wings. The wing on the right of the back wheel being especially wide.

The Zenith stand is a most distinctive feature, and merely consists of two legs swinging on a pivot-shaft passing through a tube bracing the bottom back wheel stays together. In this position the machine on the stand is balanced so that the slightest pressure at the rear end will lift the front wheel from the ground, and the whole design is simplicity itself. Another point to notice is the easy detachability of the back wheel from the frame.

**SPEEDWELL MFG. Co., No. 124a.**

SPEEDWELL MFG. Co., Abbey Works, Alcester.—This firm makes a speciality of conversions from single to three speeds with Armstrong hub gears. Examples

Examples of the 3½ h.p. and 6 h.p. Zeniths. Both models have J.A.P. engines and the Gradua gear.

1913 pattern Scott. The tank has a leather covering. Observe the encased gear.

Ladies' three-speed Hobart, a clean design with vertical engine.

of machines so converted are on view, and complete back wheel sets, suitable for Triumph, Rudge, and other machines, are exhibited complete with the hub and control, which can be either by pedal or Bowden cable and hand lever.

**THE SERVICE CO., No. 17.**

SERVICE Co., High Holborn, W.C. (No. 17).—Another interesting attachment is the Carrol sidecar. In this sidecar the rear wheel is carried on a small additional frame hinged upon the rear tube and connected thereto by a coil spring. It also slides on this tube to a limited extent, and consequently has a sort of radial castor action. At the front of the foot-board there is a chamber which is connected by flexible pipe to the exhaust pipe of the motor bicycle, and acts as a foot warmer for passenger. The body is

held to the frame by a spring bolt. If this bolt be disengaged the whole of the mudguard can be swung round to act as

Montgomery "Man of War" type sidecar body with cantilever springs.

a stand. The Brown and Hingston two-speed gear is also exhibited. This has been improved in detail, and will be referred to later.

Service accessories are dealt with on a later page.

Vevo folding foot pump.

comfortably light, well upholstered, and provides ample leg room. Another feature is a quickly detachable sidecar fitting which is a decided departure from standard practice. The Service sidecar is provided with a particularly strong hub, and the main mudguard stay is

**TAYLOR AND CO., No. 166.**

H. TAYLOR AND Co., 21a, Store Street, Tottenham Court Road, W.C.—The Douglas, Rex, Rudge, and A.J.S. machines (for which last named make the firm are the sole agents) are exhibited on this stand, and some interesting examples of sidecars are also displayed. One of the

features is a coach-built sidecar body, beautifully constructed with sheet steel panels, and with a compartment at the back for the spare tyre. This has been designed especially for the 5-6 h.p. A.J.S. sidecar machine.

**A VARIED EXHIBIT.**

WAUCHOPES, LTD., 9, Shoe Lane, E.C.—Some of the best known makes of motor bicycles are shown here, such as the Matchless, Chater-Lea, Triumph, Williamson air-cooled, Humber, Douglas, and Premier, for which the firm are agents.

Warming pipe from the exhaust inside the induction pipe on the Williamson.

Messrs. Wauchopes make a speciality of dealing with all makes of new and second-hand motor bicycles, and have had a long experience in this branch of the business.

6 h.p. Excelsior, with counter-shaft gear and chain drive.

**A.C., No. 60.**

5.6 h.p. MODEL: 95×102 mm.; m.o.v.; cooling air; B. and B. carburetter; chain; epicyclic two-speed gear; single-cylinder engine; wheelbase, 6ft. 2in.; track, 4ft. 6in.; weight, 560 lbs. (chassis); seats, side by side.

**AUTO-CARRIERS (1911), LTD.,** Thames Ditton, Surrey. — The Auto-Carrier machine is now so well known on the road that a detailed description is unnecessary. However, for the benefit of those who have not a practical acquaintance with the machine, it might be briefly described as a runabout, capable of doing as much as and more than many four-wheeled vehicles. The passenger and driver are seated side by side, while the engine is situated behind the seats. The engine is of the single-cylinder vertical type, air-cooled, with two large flywheels on each side of the crank case, air vanes being cast on the flywheels to act as fans. The drive is from a small sprocket on the left-hand side of the crank case to a sprocket on the rear wheel axle. The rear axle is supported on leaf springs, and carries an epicyclic gear. The low speed engagement is brought into operation by the depression of a pedal by the right foot, while the engagement for the direct drive is brought about by pressing forward a vertical lever, this locks together the whole of the epicyclic gear, which thus revolves as one mass. With reference to the petrol supply tank on this vehicle, a rather novel feature is embodied. The filler cap carries a hollow tube screwed at its lower end and drilled with a hole about an inch up. The feed to the carburetter is in the normal way through this hollow, but in case the vehicle stops for want of petrol it is only necessary to unscrew the filler cap, and it is found that there is a reserve of petrol about the depth of the hole from the bottom of the screwed stem which serves to get the passenger either home

or to a place where a fresh supply can be taken in. The steering is by hinged tiller, the lower part of the steering stem being directly connected with the front steering levers. It should be mentioned that, in addition to a foot-applied brake which can be notched up automatically to any given degree of pressure and released instantaneously, there is a pair of front wheel bands to operate on the front hubs. This brake is applied by pulling back the same lever, which when pushed forward gives the direct top speed drive. The bands of the foot and hand brake are lined with Ferodo. The frame is tubular built, and is supported at the front on semi-elliptical springs and at the rear on inverted quarter elliptical springs. On the two-seated vehicle staged a very easily raised and lowered hood is fitted, whilst the storm apron, or dash, is hinged at its

Design of cylinder on the A.C. from which the large radiating surface will be noticed.

lower forward end, and carries at the upper end a hinged wind screen which can be adapted to any angle. This is not only an efficient waterproof guard, but entrance to the front is made particularly easy. There are other models staged — a two-seater which carries a dickey seat behind for a third passenger, and also luggage carrying models suitable for various trades. It is interesting to note that there are some 1700 of these vehicles now on the road, and the output at the works is about twenty-five per week. The wire wheels carry 650 × 65 mm. tyres to the front, and the single rear wheel 700 × 75 mm.

**ALLDAYS, No. 106.**

**MIDGET MODEL:** V twin-cylinder; 85 × 88 mm.; air-cooled; m.o. valves; worm drive; three-speed gear; wheelbase, 9ft.; track, 4ft. 2in.; weight, 6 cwt.; position of seats, side by side

**ALLDAYS AND OXONS, LTD.,** Fallows Road, Sparkbrook, Birmingham. — On this stand two vehicles are exhibited, one the Alldays Midget and the other the Expressodel. The former is a four-wheeler and the latter a three-wheeler. The Midget car has a twin-cylinder air-cooled engine, the drive from

this being through a cone clutch and a three-speed and reverse gear box, thence through a universal joint at the forward end of the propeller-shaft to the worm-driven rear axle. The propeller-shaft is enclosed.

The main frame is tubular, and the springing thereof is by means of inverted elliptic springs centrally pivoted at the front and similar springs at the rear. Both foot and hand brakes act upon the rear wheel hubs, the hand brake being of the contracting band type lined with Ferodo, and the foot brake internal expanding metal-to-metal. 650 × 65 mm. tyres are fitted to the road wheels, which are wire built. The front axle is an "I" section steel stamping. The steering is of the worm and sector type. The vehicle is shown with lamps, wind screen, and hood, and presents a good appearance.

**8 h.p. MODEL:** 108×114 mm.; water-cooled; m.o. valves; carburetter to order; chain; three-speeds; wheelbase, 4ft. 6in.; seats side by side.

The "Expressodel" is shown with a luggage-carrying box forward of the steering wheel and seat accommodation for a passenger beside the driver. The frame is of channel steel. The two front wheels, which are steered by a worm and quadrant, have axle pins swivelling in the open-jawed ends of the tubular front axle. Semi-elliptic springs of good length and camber are fitted to support the front end of the frame, whilst inverted semi-elliptic springs are arranged between the rear of the frame and the rear axle, the spring being pivoted at the centre. The engine is situated beneath the driver's seat, this latter can be tipped forward on a hinge so that it renders the engine quite accessible. The engine is of the single-cylinder water-cooled type set transversely on the frame. The cone clutch transmits the power to a three-speed gear box, from the gear-shaft of the latter through a chain to a large chain wheel to the rear axle. A chain case is provided to afford proper protection from dust and mud. The radiators for cooling are of the vertical gilled tube type, and are placed on each side of the driver's seat.

Attention should also be paid to the lever and rod arrangement provided for keeping the rear axle parallel with the frame. This vehicle is most handy for rapid delivery of parcels, and has a carrying capacity of 5 cwt.

**ARDEN, No. 27.**

**8 h.p. MODEL:** 85 × 85 mm.; mechanical valves; two-cylinder V type, air-cooled; J.A.P. carburetter; gear and propeller-shaft transmission; three-speed gear; wheelbase, 7ft.; track, 3ft. 8in.; seats side by side; weight of chassis, 5½ cwt.; finished vehicle, 6½ cwt

**THE ARDEN MOTOR CO., LTD.,** Berks-well, near Coventry. — This vehicle, shown in chassis form and as a finished car, presents a very good appearance, and is practically a small edition of an ordinary touring motor car. The V type engine is cooled by means of a fan situated in front, the bearings of the fan being carried in spring-controlled hinged brackets so that the rear end of the fan drive

A thickly upholstered back rest is provided on the A.C. Sociable, under which are arranged pouches for tools.

**The Olympia Show.**

shaft which carries a friction wheel is kept in contact with the flywheel. The magneto is mounted on a stand above and central with the two cylinders, and is chain driven. A standard J.A.P. automatic carburettor is fitted. The drive is through a leather-to-metal cone clutch to the three-speed gear box, the top speed being direct. The gear is actuated by means of a hand lever working over a straight-cut quadrant. The propeller-shaft is enclosed, and drives the rear axle through a pair of bevels. The frame is of wood reinforced with steel flitch plates, the frame being mounted at the front on three-quarter elliptic springs and at the back on a special form of quarter-elliptic spring, the rear end and plates of this being carried in a slide lock arrangement. The axle spring flaps are distanced by means of radius rods. 28in.  $\times$  2 $\frac{1}{2}$ in. wire-built wheels are fitted. The steering is of the direct acting lever type. The control of carburettor throttle, extra air, and ignition timing is by means of levers placed on the steering stem and on the spoke of the steering wheel, the motion being transmitted by means of Bowden wires. The foot and hand brake take effect on the rear wheel brake drums, the foot brake being internal expanding metal-to-metal, while the hand brake is of the contracting band type lined with Raybestos. The petrol and oil tanks are carried beneath the torpedo dash. The oil feed to the engine is automatic. The finished vehicle presents a smart appearance, fitted as it is with single hinged wind screen, Cape hood, luggage carrying locker behind, and acetylene head lamps with separate generator.

**AUTOTRIX, No. 47.**

8 h.p. J.A.P. and 5-6 h.p. Fairair Models: 85 $\times$ 85 and 70 $\times$ 80 mm.; m.o.v.; twin-cylinder water-cooled V type engine; Senspray carburettor; two speeds; gears and chain; side by side; wheelbase, 7ft.; track, 4ft. 3in.

EDMUNDS, WADDEN, AND Co., Weybridge.—In this model the twin-cylinder water-cooled engine transmits the drive from the crankshaft, which is furnished with a small self-contained clutch, to the gear box, which gives two speeds, and thence by means of a single chain to the single rear wheel. The gear is operated by a lever working over a straight-cut quadrant. There is a small crescent-shaped vertical tube radiator in front.

The magneto is chain driven, and is carried forward of the engine. The crank case is in an accessible though unobtrusive position. The main frame is of tubes suitably strutted and braced where necessary. The steering is of the plain hobbin and cable type. The road wheels are wire built, the front carrying 6 $\frac{1}{2}$ 0 $\times$ 65 tyres and the rear 700 $\times$ 85. The frame is sprung by semi-elliptic springs at the front and by a pair of quarter inverted elliptic springs at the rear. One of the models shown is fully equipped with wind screen, Cape hood, speedometer, and everything necessary for the road. We would point out that the body work of the seats is of very narrow size from front to back—a small matter which might be easily remedied with advantage to the user.

**BEDELIA, No. 23.**

8-10 h.p. Model: 80 $\times$ 100 mm.; exhaust mechanical inlet automatic valves; twin V air-cooled engine, 90°; G. and A. carburettor; chain and side belts; slipping belt with low emergency pulley; one model expanding and contracting pulley on counter-shaft; wheelbase, 8ft. 6in.; track, 3ft.; weight, 400 lbs. complete; tandem seats.

PALMER AND Co., Tooting, S.W.—The models on this stand are fitted with boat-shaped bodies, and present a very racy appearance with torpedo dash, and curved back and body made up of aluminium and wood. The 90° V-type air-cooled engine is placed transversely in the frame. The ignition is by Nilmelior alterno magneto. The drive from the crankshaft is by means of a roller chain to a chain wheel on the counter-shaft. The counter-shaft ends have twin pulleys, one size being larger than the other. On one model there is an expanding pulley, the decrease in size being brought about by increasing the belt tension.

The side lever is so arranged that as the belt sags on pulling the rear axle forward bodily and the hand brake is applied, since the belt rims come into contact with fixed shoes. The other brake is applied by means of a pedal, the first depression lifting the exhaust valves of the engine and further depression applying a metal band brake on the drum secured to the counter-shaft. The front axle is tubular, centrally pivoted with the spindle acting on a coiled spring contained in the barrel. Suspension is thus three-point. The

steering is by means of duplicate wire cables which are wound on a wooden hobbin under the action of the steering wheel, which is wire built. The road wheels are wire built and fitted with 26 $\times$ 2 $\frac{1}{2}$  tyres. The rear suspension of the chassis is by means of inverted quarter elliptic springs. With regard to the seating of the body, this is of the hammock type for the front and rear passenger.

**CHATER-LEA, No. 78.**

8 h.p. Model: 85 $\times$ 85 mm.; m.o.v.; V type; air and water-cooled; Amac carburettor; gear and worm; three speeds; gate change; wheelbase, 7ft. 6in.; track, 3ft. 10in.; two seats side by side.

CHATER-LEA, LTD., Golden Lane, E.C. —The fittings supplied to the trade by this well-known firm have an excellent reputation, and in the cyclecar chassis exhibited the high quality of the design, con-

Double acting belt rim brake on the Day-Leeds cyclecar.

struction, and material which is put into the parts which go to make up the chassis is clearly apparent. One of the chassis has an air-cooled 8 h.p. V type engine, 85 $\times$ 85, whilst the other has an 8 h.p. water-cooled engine of similar dimensions. Dealing with the first chassis, this has a leather-to-metal cone clutch to transmit the power for the engine, the clutch being engaged by the action of the compression spiral springs. The power is transmitted to a three-speed gear box, actuating an enclosed propeller-shaft by a gate change lever to the worm-driven rear axle. Top gear ratio is 4 $\frac{1}{2}$  to 1. The brakes are arranged so that the hand brake acts upon the rear wheel brake drums, whilst the foot brake (which is of the contracting type, is applied to the drum behind the gear box. The chassis has a pressed steel frame inswept at the front to give a large steering lock, whilst tubular cross members carry the braking, tackling, and the gear box. The frame is supported by semi-elliptic springs at the rear which take the drive, and no torque rod is fitted to the back axle. Wire wheels are fitted with 650 $\times$ 65 mm. tyres.

With regard to the water-cooled model, the front of the bonnet is closed by a V-shaped radiator having an open centre, and with this it presents a remarkably pleasing appearance. A special point to notice is the large clearance from the ground, which renders it suitable for colonial work.

The Craig three-wheeler. The engine cover has been removed to show position of engine and gear box.

## The Olympia Show.—

## DAY-LEEDS, No. 95.

8.9 h.p. MODEL: 85 × 88 mm.; V type 60° air-cooled m.o.i.v.; carburetter to order; gear: counter-shaft and side belts; sliding gear; three speeds; wheelbase, 6ft. 6in.; track, 3ft. 9in.; weight of chassis, 4½ cwt.; total weight, 5½ cwt.; side by side seats.

JOB DAY AND SONS, LTD., Ellerby Lane, Leeds. This vehicle was briefly described and an illustration of it complete was given in *The Motor Cycle* of the 14th inst., page 1301. The V type air-cooled engine is set in the frame with the crankshaft longitudinal therewith. The fibre-faced cone clutch transmits the engine power to a three-speed gear box giving direct drive on the top gear. The gears in turn pass the power to a bevel-driven counter-shaft with combined straight pinion differential. The ends of the counter-shaft have pulleys to take 1in. V belts, which drive the rear wheels. Chain sprockets instead of the belts can

be specified if desired. It should be specially noted that particular attention has been directed to the production of a machine which should prove very free from frictional resistance, since the whole of the bearings—less those of the engine—are of the self-aligning double row type, Skefco pattern. The tubular frame is well sprung on semi-elliptic plate springs of fairly large compass.

The twin Motosacoche has a half compression tap fitted half way down the cylinder.

Both sets of brakes act upon the rear wheel brake drums. Special attention has been directed to engine lubrication, the lubricators being foot operated. The road wheels are detachable and interchangeable throughout, and arrangements are made for carrying a spare wheel. 650 × 65 mm. tyres are fitted. The petrol tank holds two and a half gallons and a half gallon of lubricant.

A refinement is the fitting of a starting arrangement to enable the driver to start the engine from the seat without using the starting handle. Generally speaking, this model is well produced.

Front view of the 8 h.p. Duo.

Chassis of the Chater-Lea cyclecar with 8 h.p. air-cooled engine.

## DUO, No. 53.

8 h.p. MODEL: 85 × 85 mm.; mechanical valves; V type engine, air-cooled; Lukin carburetter; single chain to counter-shaft and two side belts; expanding pulley; variable gear; wheelbase, 7ft.; track, 3ft. 4in.

DUOCARS, LTD., York Street, Westminster, S.W.—This vehicle is noticeable for being fitted with a framework made entirely of timber, having two fairly lengthy longitudinal members forming an inner frame and two outer main frame members, whilst there are five transverse bars for staying the longitudinal members together, and carrying the engine and various fittings, such as counter-shaft, brackets, and springs. The engine is set in line with the frame, and power is transmitted by a single roller chain from a sprocket on the left-hand side of the crankshaft to a sprocket fixed to the counter-shaft. At the end of the counter-shaft are expanding pulleys, which are contracted or expanded by the action of a quick thread boss, so that as the pulley flange is moved outward the effective driving diameter is increased, thus raising the gear ratio. From the counter-shaft the final drive is by belt. To take up slack or allow for the tightening up of the belt on the alteration of the effective diameter of the counter-shaft pulleys, there is a hand lever arranged at the right-hand side of the driver's seat, which operates suspension links which serve to push back or pull forward the rear wheel. Two brakes are fitted, one acting inside and the other outside the belt rim. The latter comes into action when the rear wheel is slid back to its fullest extent. The steering is of the thimble and wire type, the wires being arranged in duplicate. They are fitted with springs at their ends, so as to absorb road shocks and ease the strain on the wires. The front axle is tubular, carrying open steering jaws at its outer ends, whilst a special arrangement of swivelling half-elliptic springs are fitted to each side at the rear. The road wheels are wire-built, and fitted with 650 × 65 mm. tyres. The petrol tank is arranged in bonnet form, forming the upper part of the hollow dash. The lubrication is by a

hand-operated pump, the oil tank being carried on a board which forms the front of the driver's seat. It should be noted that for cooling the engine a cast aluminium fan, belt-driven, is fitted on the right-hand side of the engine. Although the design is unconventional as regards frame, springing, and other minor points, it presents a workmanlike appearance.

## ERIC, No. 45.

Mechanical valves; Amac carburetter; gear on propeller-shaft; twin opposed water-cooled engine; three-speed gear, gate change; two seater, side by side.

P. AND C. SYNDICATE, LTD., St. Giles' Chambers, Northampton.—This three-wheeled machine has a dummy front bonnet and radiator. It was fully described and illustrated last week on page 1347. The twin horizontal opposed engine and the gear box form one unit. The power is transmitted through clutch and three-speed gear to the bevel-driven single rear wheel. The radiator is of the tubular type, and is carried beneath the seat. Provision is made for attention to the high tension magneto by the removal of a slide at the centre of the passenger's cushion. One of the vehicles shown is complete with lamps, hood, and wind screen. An additional model to the one described last week has a vertical single-cylinder air-cooled engine. In this the crank case is supported on the large tubular centre member, which is practically the main frame of the machine. Mechanical transmission is used, and an Amac carburetter is fitted. A large flywheel on the right hand of the engine drives a large aluminium cast fan. The drive is from the clutchshaft to the gear box by means of a roller chain, the gear box giving three speeds, these being operated by a gate change lever arranged outside the body. On the other side of the gear box the drive is continued by means of a roller chain to the rear wheel. A foot-operated expanding metal-to-metal brake is arranged to act on the drum on the right hand side of the gear box, while a hand applied brake operates upon the rear drum. In this case the rear wheel is sprung by quarter inverted elliptic springs, while the front axle is sprung by means of semi-elliptical springs. The

### The Olympia Show.—

steering is by a chain running over a sprocket at the bottom of the steering stem, the chain being connected to cables which transmit the motion to the steering lever.

ERIC SOCIABLE CHASSIS.

G. Bolt to be removed to render back wheel accessible. H.H.I. Hinges on which near side back fork and chain stay turn aside when nut G is removed. K. Fixing point of rear spring to pivot of triangular back wheel support. K. Fixing point of spring to rigid portion of frame.

### GIRLING, No. 110.

5 h.p. MODEL: 95 × 95 mm. = 650 c.c.; mechanical valves; wheelbase, 7ft.; track, 4ft. 8in.; weight, 6 cwt.

GIRLING MOTORS, LTD., Finsbury Circus, E.C.—The Girling utility car is intended to be used by inspectors, surveyors, and commercial travellers. The speed is up to about 30 m.p.h. It is made intensely strong, and will carry an extra passenger, or there is room for a quantity of luggage. It possesses many interesting mechanical features. In the first place, the engine is air-cooled, and practically the whole of the cylinder is enclosed in an aluminium casing, formed in two halves. On one side is an enclosed fan, driven off the flywheel by friction. The friction wheel is kept up against the rim of the flywheel by means of a screw. The fan draws air across the radiating fins on the valve box round the sparking plug and over the top of the

head are exposed to view, and can be cleaned without any further dismantling of the engine.

The valve operating mechanism resembles that employed on the Lanchester car. The valve springs are flat, and are connected up to the cotters by means of wire links. The oil filler cap on the base chamber carries the relief valve, which is merely a flat strip of brass, anchored at one end and covering a large hole. It works admirably, we were told.

Lubrication is effected by two plunger pumps operated by the valve cams. The pumps fill with oil the small sump, out of which they project, lubricating the small pinion of the 2 to 1 gear, the large pinion, and also the cams; at the same time the oil is fed into the big end trough, and then overflows into the main sump and back through gauze filters to the pumps.

The change speed is by friction disc and wheel, the bearing adjacent to the

friction wheel being both a thrust and load bearing, thus taking up the thrust of the friction disc. All bearings are Skefko, self-aligning. Gas is fed to the engine by means of a single lever control carburetter. The control of the friction disc is by pedal, on which the driver's foot lightly rests the whole time. In this Mr. Girling claims the success of his system lies, since the pressure can be varied according to the gear ratio in use. When the highest gear ratio is in use, very light pressure is needed, more pressure being required on the lower of the five speeds provided. A second pedal is used for declutching, a further movement of which brings the friction-driven shaft up against a fixed shoe brake.

The final drive is by propeller-shaft to a bevel gear at the rear. A sliding joint is provided at the forward end of this shaft, while the whole thereof is enclosed in a torque tube provided with a U joint at its forward end. To remove the rear wheel it is only necessary to swing outwards the rear spring, and undo the nuts which secure it to the bolts situated at intervals round the hub shell, when the wheel can be drawn out.

In the bevel gear case an internal expanding brake is fitted.

The frame is of oak, 7in. deep by 1½in. wide, suitably strengthened where necessary. A metal frame bolted thereto supports the friction disc shaft on two ball bearings.

### G.N., No. 31.

8-10 h.p. MODEL: 80 × 98 mm.; mechanical valves; V-type engine, air-cooled, round barrel; chains to counter-shafts, final side belts; two-speed, straight quadrant; wheelbase, 8ft.; track, 3ft. 6in.; weight, chassis 3½ cwt.; side by side seats.

GODFREY AND NASH, The Burroughes, Hendon, N.W.—This model has the engine placed longitudinally in the frame. A large outside flywheel drives a three-blade

Friction-driven fan on the G.N.

fan by a pulley on the left-hand of the engine between the cylinders. The drive is from a chain wheel at the inner side of the flywheel to a counter-shaft carrying a plate leather-faced clutch engaged by four toggle levers and actuated by a strong compression spring. On each side of the clutch the drive is further transferred by a roller chain to chain wheels on another counter-shaft. These

Girling cyclecar engine, showing the laminated valve springs, etc.

Cylinder, showing easily detachable valve box.

**The Olympia Show.**

chain wheels can be locked to the counter-shaft by means of a sliding sleeve, which carries two pegs at its extremities. These pegs can be brought into holes in the chain wheels, so the drive is turned to either end of the counter-shaft from which belts transfer the final drive to the

being by means of a roller chain through a three-speed gear box, whence the power is transmitted by a single chain to the rear axle. A hand applied brake takes effect on two drums on the rear axle, whilst the foot brake acts upon a drum on the left hand side of the gear box. The frame is tubular supported on quarter

twin-cylinder water-cooled engine is specially made for this firm by the Coventry Simplex Engine Co., and is arranged a little behind the centre of the frame beneath the boot and slightly behind the passenger's seat. The engine is set transversely in the frame, and a large friction surface flywheel is arranged

The racy looking G.N. runabout shown by G. N. Higgs.

rear wheels. The engagement on the right-hand side chain wheel gives the low speed and on the left-hand side the top speed. A pedal and hand-applied lever bring into action two brake shoes on the inner surface of the belt pulleys. The frame is of wood, the engine being carried on wooden cross members, and the support for the counter-shaft is also of the same material. The steering is by wheel and twin cables actuated by a metal bobbin. The front suspension is by quarter elliptic springs. The petrol tank is circular and carried in a wooden thimble at the rear end attached to the dash and by a clip formed by two angular pillars at the front. The tyres, on wire wheels, are 650 x 65 mm.

**GORDON, No. 33.**

85 x 95 mm.; cooling air; m.o. valves; Senspray carburetter; chains and gear; three speeds; engine, V type J.A.P. 90°; wheelbase, 7ft 6in.; wheel track, 3ft. 8in.; weight, 5 cwts.; seats, side by side.

G. ARMSTRONG, East Riding Engineering Works, Beverley.—This four-wheeled vehicle has a twin-cylinder V type engine with the crankshaft set transversely in the frame, the drive from the crankshaft

inverted elliptic springs at the rear, and likewise at the front. The wire built wheels have 650 x 65 mm. Palmer tyres all round. The steering is of the plain lever type. The petrol and lubricating oil tank form the upper part of the torpedo dash. The seats are upholstered in pleated form and are practically hammock supported.

**G.W.K., No. 34.**

8 h.p. MODEL: Mechanical valves; Solex carburetter; friction drive, propeller transmission, shaft and bevels on back axle; twin-cylinder vertical water-cooled engine; wheelbase, 7ft. 7in.; track, 3ft. 9in.; weight, chassis, 5½ cwts.; seats side by side.

G.W.K., LTD., Datchet, Bucks.—Inspection of the chassis and finished vehicle of this highly successful car discloses the great attention which has been paid towards obtaining a reliable and speedy vehicle. The oft discussed friction drive embodied in the design of this vehicle is here shown in its best and latest form, and the records and severe trials which the G.W.K. has accomplished are sufficient answer to the critics who assert

that this drive is impractical. Looking at the chassis we find that there is at the forward end a plain vertical tubular type radiator arranged with the tubes slantwise to allow large and effective cooling surface. From the lower end of this the long water pipes run to the engine, the water pump shaft, and the magneto shaft being in line, and chain-driven. The

Finger adjustment for the rear brakes is provided on the G.W.K. Note also attachment of springs to rear axle.

to act upon another disc which transmits the motion to a propeller-shaft, which is further connected at the rear end with the rear axle by means of a bevel drive. A lever placed immediately to the right of the driver can be slid along so that the friction-driven wheel can be moved over the surface of the driving wheel. Thus the gear ratios are increased as this

Valve side of the 8 h.p. Coventry Simplex engine fitted to the G.W.K.

friction wheel is moved from the centre to the outer diameter of the disc. On passing on the other side of the centre a reverse motion is given to the vehicle. Depression of a pedal by the left foot causes the friction-driven disc to be moved out of contact with its driver, and by further pressure a shoe brake is brought into action on a drum arranged at the forward end of the friction-driven shaft. The frame is of pressed steel, in swept at the front to give large steering lock, and is mounted at the front end on semi-elliptical springs, and at the rear on half inverted elliptical springs. The steering is of the pinton and quadrant

The Gordon, a Yorkshire built runabout.

**The Olympia Show.—**

type. The front axle is tubular. The wheels are wire built, 26in. x 24in. in size. The side lever serves to apply expanding metal-to-metal brakes on the rear wheel hubs.

Generally speaking, the chassis is a finely finished piece of work, and the general appearance of the vehicle, as a complete machine, is quite attractive.

Standard pattern G.W.K. cyclecar for 1913.

**HUMBERETTE, No. 52.**

HUMBERETTE: 84 x 90 mm.; V type twin; m.o.f.v.; four-jet carburetter; gear and propeller-shaft transmission; three-speed gear; wheelbase, 7ft. 3in.; track, 3ft. 6in.; weight of chassis, 6 cwts.; seats side by side.

HUMBER, LTD., Coventry.—The Humberette chassis is a fine piece of work. The V type engine crankcase, the gear box casing, together with the clutch enclosing member, are all of aluminium and form a single unit. The drive from the engine is through a cone leather to metal clutch engaged by three compression springs. The gear box case contains three speeds, and the drive to the rear wheels is by propeller-shaft. The tubular frame is carried at the front on a single transverse semi-elliptic spring, the ends of the open-jawed tubular axle being stayed by tie rods to the crank case. The rear of the frame is carried on quarter inverted elliptic springs. Spring-ended radius rods are fitted to the rear axle. The foot and hand brakes are of the contracting type lined with a friction producing material. The foot brake takes effect on a drum behind the gear box, and the hand brake on drums attached to the rear wheels. Easy adjustment of both brakes is arranged for. The steering is of the rack and pinion type. The wheels are wire built, with 650x65 mm. tyres. The throttle control is by pedal and by lever working over a quadrant secured to the steering stem below the wheel. The ignition is controlled by a hand lever on the steering wheel, the connecting rod passing through the hollow stem connecting at the bottom with levers which move the contract breaker magneto. The petrol and lubricating tanks are carried beneath the scoop dash. The neat fitting of the horn, acetylene lamps with separate generator, and the hood should be noted. Various shades of finish are obtainable.

**L.M., No. 115.**

8 h.p. MODEL: 85x85 mm.; air cooled; B. and B. carburetter, hand controlled; two speeds, chain and gear. Engine, J.A.P., 50°; wheelbase, 7ft. 9in.; wheel track, 3ft. 3in.; weight, 6½ cwts.; seats, side by side.

WM. M. CUNNINGHAM, Clitheroe, Lancs.—The L.M. car has a twin-cylinder

belt rims. The foot brake is of the contracting band type, situated at the side of the gear box. The petrol tank is carried beneath the dash. The steering is by direct levers. The steering stem

Front springing of L.M. quad.

is hollow, and carries the casing of the control wires. The seats for passenger and driver are hammock type. In the curved back of the body there is a lid, behind which luggage may be carried. The wire wheels are fitted with 26x2½in. tyres. The three vehicles shown on the stand all bear witness to careful attention to finish.

**MEDIA, No. 125.**

MESSRS. MEAD AND DEAKIN stage the Media cyclecar. This machine has an 8 h.p. air-cooled engine and friction drive. It is illustrated on another page.

**MATCHLESS, No. 72.**

H. COLLIER AND SONS, Plumstead, S.E.—The new Matchless cyclecar is fitted with a 90° J.A.P. engine, having overhead valves. It is a three-wheeler, the torque rods and the springing of the rear wheel are clearly shown in the illustration we publish on this page. The seats are side by side.

The transmission is oil-retaining and dustproof. The two-speed gear box is made in one unit with the engine, and includes a Ferodo-lined cone clutch. The whole engine and gear box unit is suspended from three points. The power is conveyed by a cardan-shaft to the bevel-driven back axle. The top gear is direct, and the lower gear is very seldom required. The capacity of the petrol tank is 3½ gallons; this quantity is sufficient for 150 miles.

Broadside view of the Matchless cyclecar, showing system of rear springing.

## The Olympia Show.—

Frontview of the Matchless three-wheeler, fitted with a 90° J.A.P. engine, showing the method of springing.

**MORGAN, No. 18.**

8-10 h.p. MODEL: 85 × 85 mm. = 964 c.c.; air-cooled; V type engine; B. and B. carburetter; propeller-shaft, bevel counter-shaft, and change; two speeds; no reverse; wheelbase, 6ft.; track, 3ft. 10in.; chassis, 3 cwts.; complete, 4 cwts.; side by side seats.

MORGAN MOTOR CO., LTD., Worcester Road, Malvern Link.—This vehicle is one of the three-wheel type, the rear wheel being driven. The engine is the 8 h.p. J.A.P., set longitudinally in the front, the drive being taken from the engine to a propeller-shaft through a leather-to-metal cone clutch, which is engaged by four compression coiled springs. The propeller-shaft extending behind the clutch is encased in what is practically the main supporting member of the frame. The propeller-shaft has a ball bearing at both ends. Arranged on the counter-shaft are

pivots of the front wheel are carried in columns, which are well braced by means of two transverse tubular members, compression springs being arranged to take the load. Direct wheel steering is fitted. There are two brakes, both acting on the rear wheel brake drums. One is pedal operated, while the other is hand operated, both being of the contracting band type. The rear wheel is attached to a pivot on the casing which is at the back of the gear box, the wheel being allowed movement by the action of a half elliptical spring. The change speed-gear is actuated by a pull up and push down lever, which is situated immediately behind the hand brake. The control of the carburetter is by means of a lever and Bowden wire on the steering wheel. The

8-10 h.p. Morgan runabout, with light scuttle dash body, minus doors.

two chain wheels, which can be engaged by one or other of a pair of dogs. The final drive is thus by one or other of the two chains fitted, which give motion to the sprockets fixed to the rear wheel hub. The road wheels are wire, mounted on adjustable cone bearings, and are fitted with 650 × 55 mm. tyres. The steering

timing of the high-tension magneto is variable. A large locker for tools and spares is arranged beneath the footboard, and, so far as the bodywork is concerned, the passengers sit side by side in a most comfortable position. A large bracket is arranged behind the body to carry any extra parts required for touring. Substantial front and rear mudguards, in conjunction with a hood and wind screen, make this vehicle suitable for use in all kinds of weather.

**NEW HUDSON, No. 62.**

THE NEW HUDSON CYCLE CO., LTD., Birmingham.—A new design four-wheeler

New 8 h.p. Media cyclecar exhibited by Messrs. Mead and Deakin.

built on motor cycle lines throughout, was a late arrival on this stand. We are, however, able to give an illustration. The power is supplied by a 4½ h.p. single-cylinder engine. This engine has a long stroke, and is fitted with a decompressor which may be controlled from the steering wheel, an additional control lever actuating a Brown and Barlow automatic carburetter. The transmission is by belt from engine to gear box, working on large pulleys, and by chain from gear box to live axle. The gear box is a new Mark X. Armstrong, specially made for cyclecar work, which provides three gear ratios of 5, 7½, and 12 to 1, and incorporates a multiple disc clutch, which is pedal operated. An eccentric chain adjustment is provided. The rear axle is of the live type, and runs on ball bearings throughout. It is fitted with a central differential and a drum for a powerful brake of the internal expanding type, which type of brake is also fitted to each rear wheel. Steering is carried out on the worm and sector principle, and all wheels are shod with 26in. × 2½in. extra heavy Dunlop studded tyres. The steel mudguards have ample side wings, and should be very efficient. The frame is tubular, the engine and gear box being carried on an underframe, and the whole is sprung on semi-elliptical springs fore and aft. The wheelbase is 6ft. 8in. and the track 3ft. 6in. A roomy coachbuilt body is fitted, and

**The Olympia Show.—**

is supplied with a scuttle dash and side door. The fine performances which we hear from private sources that this machine has put up on trial, coupled

ward in place of the two seats. Of course, the control is also arranged further back to suit the position of the driver. Both types of machine are very well finished and carefully thought out.

New Hudson, a light four-wheeler with single cylinder engine.

with its extremely reasonable price, are bound to attract many visitors.

**P.M.C. MOTORETTE, No. 68.**

6-7 h.p. MODEL: 95×102 mm.; single-cylinder; water-cooling, thermosyphon; m.o. valves; J.A.P. carburetter; chain and epicyclic gear; Roc epicyclic two-speed; weight, chassis 448 lbs.; seats, side by side.

**PREMIER MOTOR CO., LTD., Aston Road.**—The Motorette is a three wheeled two-seated vehicle in which the single cylinder water-cooled motor is arranged behind the passenger's seat, the motor having large flywheels on each side of the crank case, vanes being cast as spokes in the wheel to induce a draught past the tubes of the radiators arranged at each side of the rear portion of the body. The tubes are flattened and placed at an angle. A roller chain transmits the drive from the crankshaft to a chain wheel arranged on the back axle, this axle carrying the Roc two-speed epicyclic gear. This gives a direct drive on top, and the low speed. Below the top speed lever a tiller is arranged, connected by direct levers to the two front wheels. A novel point in the body of this vehicle is that the dash can be lifted after two locking bolts have been slid back. Then the dash, including the wind screen, can be raised from the side members. These latter form doors which are automatically closed up under the action of two wires which pull them together out of the way. The two front wire-built wheels have 650 × 65 mm. tyres, whilst the single rear wheel has a 700 × 80 mm. tyre.

The Omnium motor carrier, for which this firm are agents, has a carrying capacity of 6 cwt. and is identical with the above except that there is one seat for the driver arranged further back over the engine, and the carrying compartment occupies the position for-

**PREMIER, No. 111.**

7-9 h.p. MODEL (twin-cylinder): 85×88 mm.; mechanical valves; V engine, air-cooled, cylinders set at 50°; Lukin carburetter; chain and gear; two-speed and reverse, direct on top; wheelbase, 6ft.; track, 4ft.; side by side seats.

**PREMIER CYCLE CO., LTD., Hood Street, Coventry.**—This is fitted with a V-type twin engine with the cylinders set at 50°, the firing point being arranged at the correct position for each cylinder by a special arrangement of connecting rod adjustment introduced by the Premier Cycle Co. The engine is placed transversely in the frame, and the drive is by means of a single Coventry chain to the two-speed and reverse gear box. From the latter the drive is transmitted

by a single chain to the chain ring attached to the bevel type differential gear box on the rear axle. The latter is directly attached to the rear part of the frame members, whilst the forward end of the frame is attached to the front axle by means of semi-elliptical springs. The springing of the frame is thus arranged for at the forward end, whilst the springing of the body is by quarter-elliptical springs at the rear.

The two-speed gear box gives direct drive on top, whilst the low speed is indirect through a train of wheels, as is likewise the reverse. The forward speed is operated by a lever working over a straight-cut quadrant. The reverse is brought into action by the depression of a separate lever fitted with a universal joint. It is a good point to note that the top and bottom of the steering stem is fitted with ball thrust bearings. The main frame is of 1½ in. 10-gauge steel tube, the frame being trussed by extra tubular members with short struts so that all deflection is avoided. The wheels are tangent wire spoked, designed to carry 650×65 Dunlop plain-tread tyres. The length over-all is 8ft. 6in.

The engine lubrication is arranged with a Rotherham suction drip-feed lubricator attached to the lubricating tank, which is arranged beneath the dash, and is to be made part of the petrol tank. In addition there is a hand pump for giving an extra supply to the crank case if necessary. The control of the magneto timing and the throttle opening is by means of levers arranged on the steering wheel. An accelerator pedal to act upon the throttle will be fitted in future.

The clutch is of the leather-to-metal cone type. The clutch actuating pedal is operated by the driver's right foot, whilst the foot brake is operated by the left foot, this being the reverse to practically universal standard practice on motor cars, which is a pity. The foot brake is of the contracting band type, taking effect upon a drum alongside the gear box. The hand brake lever is of the push-on type, and takes effect through spring balanced rods on to malleable

Premier cyclecar with hood and screen. It has a twin-cylinder air-cooled engine and two speeds.

## The Olympia Show.—

Chassis of the Perry cyclocar in the gallery.

Wood frame of the 3 h.p. Duo.

drums, in which expanding cast iron shoes act. A point on which the Premier Co. lay special stress is that so far as the vital parts are concerned, such as the open-jawed ends of the tubular front axle, the steering swivels, transmission, axles, and so on all are of vanadium chrome steel and not malleable castings, as is most often the case in these lightly-constructed vehicles. Further, the gear wheels are air-hardened by a special process, and have an exceedingly high tensile strength, so that gear trouble should be unknown.

**PERRY, No. 157.**

8 h.p. MODEL: 72 x 108 mm.; V type; m.o.v.; water-cooled; Perry carburetter; shaft; weight of chassis, 6 cwt.; side by side.

PERRY AND CO., LTD., Tyseley, near Birmingham.—The Perry cyclocar chassis

A device for closing off the main air is fitted to the Perry radiator to ensure easy starting.

is shown complete, and is a cleanly designed piece of work from front to rear. This was described in *The Motor Cycle* of November 21st (page 1339), so that a

lengthy description would be redundant. A visitor, however, might make a note of the compact construction of the engine combined with the gear box casing, forming one unit and suspended on four forged brackets bolted to the side members of the frame. The neat arrangement of the propeller-shaft, universal joints, and the overhead casing of the back axle, and the long camber of the front and rear springs, together with the embedment of

Perry overhead worm drive.

all the brakes on the rear wheels, deserve attention. With reference to the rear springs, it should be particularly noticed that the back parts of these have first intention shock-absorbing coiled springs in compression similar to the practice which was first favoured on Daimler cars. In addition, there are detachable Sankey all-steel wheels made so that the front and rear wheels are interchangeable. To enable this to be done without interfering with the brakework the front wheels also carry brake drums.

**ROLLO, No. 119.**

8 h.p. MODEL: 85 x 85 mm.; mechanical valves; V air-cooled engine; Amac carburetter; chain from engine to counter-shaft, belts to rear wheels; expanding pulley, change speed gear; wheelbase, 8ft. 4in.; track, 3ft. 1in.; weight of chassis, 4 cwt.; seats, tandem or side by side; wheelbase, 7ft. 6in.; track, 3ft. 4in.

THE ROLLO CAR CO., LTD., Conybere Street, Birmingham.—The chassis shown suitable for the tandem form of vehicle is identical in construction with that intended for a sociable type of body, the only difference being that the frame is made wider in the latter case and the steering brought more to the right. The frame is tubular, inswept closely at the front, which portion also carries the supporting tubes for the twin-cylinder air-cooled J.A.P. engine. A belt-driven double fan is mounted on the stay members of the steering head in ball bearings. On the left side of the crankshaft is a chain sprocket, by which the drive is transmitted through a silent chain to a larger sprocket on the counter-shaft. At the end of the latter, which is mounted on ball bearings, are expanding and contracting pulleys, through which the drive is taken to the rear by belt. The pushing forward of the pedal increases the effective size of the counter-shaft expanding pulleys, and at the same time can be used for declutching purposes, so that a free engine may be obtained with the gear lever in any position. Adjustment for the belt is arranged for by means of a lever which works over a slotted quadrant placed cen-

TWO EXAMPLES OF THE ROLLO AS EXHIBITED AT THE SHOW.—(1.) The Rollo Mono, with single-cylinder engine. (2.) The Sociable pattern which has a twin-cylinder engine.

**The Olympia Show.**

veniently to the right hand of the driver. The pedal brake is internally acting, and extra hand brakes are provided when the belt adjusting lever is pushed far forward, in which case shoes are brought into contact with the forward part of the V belt pulleys. The rear part of the vehicle is suspended on inverted semi-elliptical springs. The front axle affords centrally pivoted steering, the support of the centre of the axle acting upon a coiled spring in strong compression. The steering is by means of thimble and steel wire cable. The wheels are wire-built, fitted with 26in.  $\times$  2 $\frac{1}{2}$ in. tyres.

Turning to the single-seater, this has a 4 $\frac{1}{2}$  h.p. Precision engine, 89  $\times$  95 mm., and the only difference in the arrangement is that there is a two-speed gear box, with which is incorporated a clutch. The final drive and the design of the frame are exactly similar. This model is fitted with 26in.  $\times$  2 $\frac{1}{2}$ in. tyres.

**RUDGE, No. 96.**

5-6 h.p. MODEL: 85  $\times$  132 mm.; 750 c.c.; mechanical valves; overhead inlet; Senspray carburetter; belt; Rudge-Whitworth variable gear; wheelbase, 6ft. 9in.; track, 4ft.; height to top of back seat rest, 4ft. lin.; weight, 5 $\frac{1}{2}$  cwt.

**RUDGE-WHITWORTH, LTD., Coventry.**—The Rudge cyclecar engine is the same as the one described in connection with the sidecar model, and is placed transversely in the frame, driving by a single lin. V rubber belt from the engine to the counter-shaft, and thence by two  $\frac{3}{4}$ in. belts from each end of the counter-shaft to belt rims on the road wheels. The engine pulley has expanding and contracting flanges similar to the Rudge multi-gear, but the clutch has been transferred from the engine-shaft to the counter-shaft, on which another expanding pulley is fitted. Each of the expanding pulleys has the flanges supported by ball races, but the expansion and contraction of the flanges are worked by means of forked levers and not by cams as in the case of the multi-gear.

The sizes of the pulleys are: Engine, 6in.; counter-shaft, 10 $\frac{1}{2}$ in.; side pulleys, 6in.; belt rims, 20in.; thus providing a range of gear ratios from 3 $\frac{1}{2}$  to 14 to 1. Ten notches are cut in the change-speed lever quadrant, thus affording ten different gear ratios. As in the Rudge multi, the alignment of the first drive belt remains correct throughout the range. The gear lever is fitted inside the body, and is pulled back for low speed and pushed forward for high.

except that, instead of a pedal, it is worked by handle between the off front wing and the frame. An exhaust valve lifter is provided at the corner of the scuttle dash convenient to the driver's left hand, so that when starting with the right hand the left bears on the valve lifter and the engine can be rapidly revolved.

The frame is made of steel tubing, arranged in two planes one above the other, and formed into a girder by the engine and dash supports. The rear

The Rudge runabout. Observe the springing and reclining seats.

Where this gear differs from the ordinary multi-gear is that if the car were stopped by declutching while on a fairly high gear ratio it would be difficult to start without lowering the gear. This gear has the clutch on the counter-shaft and not on the engine-shaft, so that if the car be stopped with engine running and clutch out the belt between the counter-shaft and the engine is in motion, and thus it is possible to change the gear to a lower ratio with vehicle at a standstill. The clutch lever and gear lever are together but work independently.

For starting, the auxiliary lever expands the engine pulley until the belt can drop on to a bearing ring at the bottom of the flange. The engine starter is of the Rudge geared up chain type,

springs are quarter elliptic, and the front springs semi-elliptic, the former having eight-leaves, while the latter has four. Two independent brakes are provided, both working on the rear wheels. Two shoes bear on the outside of the belt rims and two in the belt grooves. The former are operated by hand, and the latter are emergency pedal brakes.

The front dumb irons are particularly neat; here the front springs are attached, the other ends being supported by shackles fastened to the frame. The steering is by rack and pinion, the rack being connected to the left steering centre by a long rod, thus providing for a larger arc or radius to be described, in relation to the steering centre when the front wheels are lifted, than would be possible

Front and rear views of the rakish looking Rudge which is causing much comment.

"MOTOR CYCLES & HOW TO MANAGE THEM" was first published in 1900. Since then it has run through fourteen editions—thereby proving its immense popularity. Each edition has been thoroughly revised and brought up-to-date, and to-day the book is recognised as

## The Standard Handbook of the Modern Motor Cycle.

# MOTOR CYCLES & how to manage them. (Fifteenth Edition)

*Revised throughout by the staff of  
"The Motor Cycle."*

Every motor cyclist, and everyone who intends to purchase a machine, should possess a copy of the book. It is a reliable guide to the beginner and a helpful companion to the more advanced rider and the expert.

Commencing with advice on the choice and purchase of a machine, it tells how the motor works, and how its mechanism may be understood and mastered.

It then deals with every conceivable point in regard to the care, management, and running of machines of all types.

It is the only work of the kind published which gives details of the leading 1912 improvements.

The index is arranged alphabetically and is very copious. Numerous explanatory drawings are given.

This new edition has been revised thoroughly by the staff of "The Motor Cycle," and much new and valuable information has been added.

Containing new chapters on cooling systems, ladies' machines, etc., and numerous up-to-date illustrations of new features embodied in the leading machines of the day.

*Remittance must accompany all orders by post.*

For the convenience of tourists the size of the book has been made suitable for the pocket or valise.

## Know your road before you start.

It will save much time and discomfort.

"The Motor Cycle" Route Book contains carefully selected routes for the whole of the British Isles, with distances clearly shown; 45 Sectional Maps and Index Map (by Bartholomew), Speed Limits, and a copious index.

In every case the BEST route—and not necessarily the shortest—has been chosen. Large towns, congested districts, and bad roads are avoided.

Before commencing a tour every motor cyclist should study this book carefully. He will be well repaid by the added enjoyment which comes of freedom from worry.

**The Olympia Show.**

were the rack connected to the right or nearest steering centre. The car will turn in a circle of 23ft.

The body is moulded on the lines of the Rudge sidecar, and is coachbuilt, with long mudguards and belt shields, combined with running board or step. The scuttle dash is carried right up to the steering wheel. The petrol tank is a novel feature, and gives the vehicle a very racy appearance. It runs from the top of the scuttle dash, over the engine, and extends forward level with the front axle. It is an enlarged motor cycle tank, divided in the centre, thus forming two tanks, each with its own petrol tap. The capacity is five gallons, and the consumption averages 45 m.p.g.

The driver's seat is slightly in front of the passenger's, allowing space for a locker behind. The vehicle exhibited has 26in. x 2½in. Dunlop tyres, and is painted grey throughout, owing to lack of time for a more elaborate finish. It is, however, intended that the chassis shall be enamelled black and the body painted in the same manner as the sidecar.

**SINGER, No. 79.**

10 h.p. MODEL (four cylinders): 63x88 mm.; m.o.v.; water-cooled; Claudel-Hobson carburetter; three-speed gear; gate change; wheelbase, 7ft. 6in.; track, 3ft. 6in.; weight of chassis, 5½ cwt.; side by side seats.

SINGER AND CO., LTD., Coventry.—The Singer Co. make a bold display with three complete vehicles and a highly finished polished chassis. The exhibits consist of two open touring two-seated models, complete with hood and screen, lamps, etc. So far as the general arrangement of the various parts is concerned, these have been so fully described in previous issues that a brief *résumé* will serve to convey a general idea as to the design and construction.

Speaking broadly, the design is that of a car in miniature. The engine has four cylinders, water-cooled, cast in pairs, and the lubrication is mechanical. Cooling is by thermo-syphon, a large flat tube radiator being fitted. The clutch is of the leather covered cone type, whilst the rear axle is gear driven, and carries the

gear box. Close attention has been given to the design of the parts in every respect. It should be mentioned that the pinions of the gear box are constantly in mesh, the striking mechanism bringing dog clutches into action.

Foot and hand brakes take effect upon the drums on the rear wheels, both being internally expanding. The wheels are Sankey 700 x 80 mm.

An example of the Super, a tandem seated runabout.

Since our previous descriptions various minor alterations and improvements have been effected. One which is readily seen is that of fitting a first compression spring at the rear and semi-elliptic plate springs which connect the rear axle with the frame.

Water outlet pipe on four-cylinder Singer showing how inlet gases pass through slots in the casting.

The steering is of the worm and sector type, and the front axle is an I section steel stamping. The Singer is one of the best finished cyclecars of the miniature car class to be seen in the Show.

Three quarter view of Singer cyclecar with latest design of body.

**SUPER, No. 128.**

8-10 h.p. MODEL: 75 x 120 mm.; mechanical valves; V-type water-cooled engine; Claudel carburetter; chain and belts; expanding pulley; seven-speed; wheelbase, 10ft. 6in.; track, 3ft. 6in.; weight, 400 lbs.

E. JOZOR, LTD., New Oxford Street, W.C.—On the stand of Messrs. Taylor is

shown the Super tandem cyclecar. This vehicle has already been described in these columns, so that only brief reference is needed here. Attention, however, may be directed to the cross springing of the frame, which is somewhat similar to the Sizaire Naudin light motor car, whilst the springing at the rear is of a pattern now coming into favour, being the modified Lanchester type. The fact that seven speeds can be gained by means of variable pulleys which drive the belts passing over the rear wheel belt rims shows that this vehicle should be a speedy one in conjunction with the 8-10 h.p. water-cooled Anzani engine. Full provision is made for adjusting the chain drive from the engine to the counter-shaft. The car exhibits a workmanlike appearance and the inscription of the name over the radiator top gives added distinction.

**SURRIDGE, No. 21.**

8 h.p. MODEL: 84 x 88 mm. air-cooled Fafnir V twin, 50° angle; m.o.v.; B. and B. carburetter; friction and chain; five speeds forward and reverse; wheelbase, 8ft.; wheel track, 3ft. 9in.; seats side by side; weight, 5½ cwt. chassis, with body 6½ cwt.

ROBT. SURRIDGE, Lombard Grove, Camberwell, S.E.—This cyclecar is notable for having a friction drive with long shaft extending from the crankshaft to a position beneath the tool box behind the driver's seat. A large cast-iron disc transfers the motion to a cross disc fitted with leather washers. The actuation of this disc across the face of the cast iron friction wheel by means of a change speed lever at the side, increases or decreases the gear as required, and also gives the reverse. A pedal actuated by the left foot serves the purpose of a clutch, whilst in case the spring which brings the friction disc into action should break an extra lever is provided to enable the passenger to put pressure on the discs. There is also a trigger which is provided

**The Olympia Show.—**

to throw the disc permanently out of engagement. The frame is made up of four ash members, suitably reinforced by steel ditch plates. It is mounted on inverted quarter-elliptic springs front and rear. The steering is by plain lever. Lubrication of the engine is effected by a

being enclosed, the enclosing tube serving also as a torque rod. The main frame is tubular, and, also, there is a tubular underframe to carry the engine and gear box. The brakes are, so far as the foot operated one is concerned, of the contracting type with a liner acting on the brake drum of the gear box; the hand

low build and long wheelbase. The engine has the crankshaft parallel with the frame sides, the drive being by shaft to the two-speed gear, and thence by a single roller chain to the rear live axle. The working parts of the machine were hardly complete at the time of our inspection. A dummy radiator is provided. The coach-built body of the machine shown is finished black and yellow.

Surridge Cyclar, one of the smartest looking four-wheelers in the Show.

hand pump. One foot brake is fitted, this being actuated by a right-hand pedal, the braking effect passing through wire balanced cables to internal expanding shoes arranged on the rear wheel drum. The wire wheels are fitted with 700 x 65 mm. tyres. The petrol tank is carried beneath the bonnet, and holds four gallons. This vehicle is well thought out and is excellently finished.

**SWIFT, No. 100.**

6 h.p. MODEL: 75 x 110 mm.; mechanical valves; Longuemare carburetter; shaft; three speeds, gate change; wheelbase, 7ft.; track, 3ft. 4in.; weight of chassis, 5 cwt.; two seats, side by side.

SWIFT CYCLE CO., LTD., Coventry.—This cyclecar is really a modification of the ordinary motor car, the lines throughout being practically the same, the only thing being that the design is smaller. At the same time there is no undue sacrificing of strength to gain lightness, and it will no doubt perform well over the roughest of roads. The engine is of the twin-cylinder vertical water-cooled type, the cylinders being a *bloc* casting. The bore and stroke are 75 x 110 mm. respectively. The valve stems, tappets, and springs are covered by a detachable plate. The Eisemann magneto is fixed at the forward part of the camshaft timing cover and skew wheel driven. The ignition is variable by means of a Bowden wire actuated by a lever attached to a quadrant on the right hand side of the body. The same type of control is fitted to the carburetter. The lubrication of the engine is effected on the chicken fountain principle. The connecting rods are lubricated on the splash system. The cooling of the engine is by thermo-siphon, a large tubular V shaped radiator being fitted at the front of the bonnet. The clutch is of the leather-to-metal cone type withdrawable by a pedal actuated by the left foot of the driver. The gear box gives three speeds forward and reverse, a gate change lever being fitted. The final drive is by bevel, the propeller

brake is applied through balanced wire cables to gunmetal shoes, which are contained in the real wheel brake drums. Steering is of the rack and pinion type. The wheels are wire built and carry 650 x 65 mm. Dunlop plain tyres. The general finish of the body and chassis is excellent throughout, a special point about the body being that the passenger sits a little further to the rear than the driver, thus giving ample room to the driver and, at the same time, plenty of leg room to the rear passenger.

**TINYCAR, No. 47.**

Twin V type air-cooled engine: mechanical valves; two-speed gear; final single chain: seats, side by side.

NANSEN, BARKER AND CO., Esholt, Yorks.—This machine is conspicuous for its

Front view of the new Swift cyclecar.

**T.M.C., No. 22.**

7 h.p. MODEL: 60 x 75 four-cylinder vertical 848 c.c.; cooling water; m.o. valves; Stewart-Precision carburetter; shaft; three speeds; wheelbase, 7ft. 6in.; track, 3ft. 10in.; weight, chassis 5 cwt. body 1 cwt.; seats, side by side.

THE WILKINSON "T.M.C." CO., LTD., Southfield Road, Acton, W.—The T.M.C. chassis possesses a four-cylinder water-cooled engine with cylinders cast separately, the crank chamber and gear box being carried on a tubular inner frame. On one side at the forward end of the distribution gear case the magneto; which is skew driven, is situated, while a geared water pump is placed on the other, the water being circulated through the cylinders and the circular tube honeycomb radiator. Three main bearings are fitted to the engine, and all bearings are white metal-lined. The lubrication of the engine is effected by a drip-feed lubricator on the dash where the oil tank is situated. The excess of oil is pumped from the crank chamber back to the tank, so that a constant level is maintained in the troughs. The clutch is of the cone leather-to-metal type actuated by three compression springs. Close up to the clutch is the three-speed gear box, the change speed lever being actuated over a straight quadrant. An open propeller-shaft with cardan joints fore and aft transmits the power to a bevel-driven live axle. The load is carried on extension sleeves and the axle runs on ball bearings of

ample dimensions. The frame is mounted in front on semi-elliptical springs of long range and camber, while there are inverted quarter-elliptical springs at the rear. Both hand and foot brakes take effect on the rear wheel brake drums, the foot brake being internal expanding metal-to-metal, whilst the hand brake is band contracting external lined with Ferodo. The steering is by worm and sector. The front axle is tubular with open jaws. The wire wheels take 26 x 2 1/2 in. tyres. A very smart body is shown separately for this vehicle, which is an admirable piece of work throughout, such as one would expect from the makers of the T.M.C.

Chassis of the Humboretté.

Armstrong cyclecar gear for chain and belt drive, suitable also for the bottom bracket of motor bicycles.

Chassis of the G.W.K., showing general arrangement of parts.

Details of the G.W.K. foot brake. The drum is moved transversely and comes into contact with the brake shoe on the left. The spring of the friction drive is shown on the right.

Plan view of the 7-8 h.p. Premier chassis.

Arrangement of connecting rods on Perry cyclecar.

**The Olympia Show.—****TYSELEY, No. 80.**

8 h.p. MODEL: V twin water-cooled; 82½ × 102 mm.; side by side valves; two speeds and reverse gear; four wheels; weight complete under 8 cwt.

THE TYSELEY CAR Co. (proprietors, Bowden Brake Co., Ltd.), Tyseley, Birmingham, are the makers of this car, which they do not claim to be an ordinary cyclecar or to compete with the numerous lightweights at present on the market. It is called by its makers the car de luxe of the small car world. The engine, clutch, and gear box are a self-contained unit fitted in front of the vehicle under a

The Tyseley a smart-looking four-wheeler.

bonnet, both crank case and gear box being cast together. Heavy internal fly-wheels are fitted and the crankshaft runs on ball bearings.

The magneto is in an accessible position in front of the crank case and carried on a special platform. It is gear-driven off the left hand timing shaft. Lubrication is provided for by means of a small geared pump which forces oil under pressure to the various bearings and then to the shafts of the gear box. All valves are easily accessible, being arranged in front of the engine.

The gear is of the sliding type, two speeds and a reverse being provided, the top gear ratio being direct. From the engine to the gear box the power is conveyed through a plate clutch of large size, which is inside the gear box, where it can be copiously and efficiently lubricated. From the gear box to the back axle the drive is by a universally jointed propeller-shaft, and a balance gear is provided.

The frame is of pressed steel and the front axle is a stamping of I-section axle steel. The steering is irreversible, movement of the front levers being effected by the usual type of worm and wheel with ball jointed connecting rod. The worm wheel is a complete circle, not a segment, which allows for it to be turned round to engage new teeth when those previously in mesh become worn. Detachable wire wheels, 650 × 65, are fitted, and a spare wheel is included; this is carried in a recess under the seat and toolbox.

The side brakes are of the internal expanding type, hand operated, and fitted to the rear wheels. A shaft brake is also provided at the end of the gear box. The price includes a spare wheel, lamps, screen, horn, and tool-kit. The body is

coach-built with aluminium panelling. The average speed of this little vehicle is 25 to 30 m.p.h., and the average consumption 40 m.p.g. The total weight is given by the makers as under 8 cwt., but no attempt has been made unduly to lighten the parts of the Tyseley, which is essentially a small car.

**WALL TRI-CARRIAGE, No. 120.**

4½ h.p. MODEL: Precision 89 × 96 mm.; cooling air valves; H.C. carburetter; shaft; two-speed gear; wheelbase, 6ft. 3in.; track, 3ft. 7½in.; weight, 336 lbs.; seats, side by side.

A. W. WALL, LTD., Hay Mills, Birmingham.—The Roc three-wheeler, of

which many examples are shown, has the front wheel arranged and steered similarly to a motor bicycle, except that there is a long spring lever terminating in an oval-shaped handle. In one model a single-cylinder Precision engine, 89 × 96 mm., is fitted, whilst another possesses a twin-cylinder 75 × 80 mm. air-cooled engine.

The transmission design of this vehicle is worth minute inspection, for the usual direct crankshaft drive is dispensed with, and in its place is substituted a reducing pinion drive, by which the speed of the crankshaft is reduced by half. This reducing speed shaft carries a bevel into which is meshed the starting handle bevel-shaft, which revolves while the engine is in motion, and a prolongation of the driving-shaft carries the differential gear.

The gear can be locked up so that the drive is then transmitted through an enclosed propeller-shaft to the bevel driven rear axle.

The release of the centre pedal and pressure applied on the left-hand pedal brings the epicyclic low speed gear into action, whilst depression of the right-hand outer pedal applies the contracting brakes to the rear wheel drum. The Wall tri-cycle is not new to the Show.

The hand applied brake consists of a single fibre shoe, which acts upon a V rim on the right-hand rear wheel only.

The frame is made up of substantial tubes, goose-necked at the front, and carried to the rear axle sleeve. Also attached to the frame are double plate flat springs, which carry the body.

The models shown include a single-seater, a two-seater (side by side), a single-seater with luggage-carrying box behind, and all give the impression of excellent workmanship and high-class material. Quite a number of these handy tri-carriages are in use for delivery of goods.

**WILTON, No. 123.**

9 h.p. MODEL: Interchangeable valves; new J.A.P. air-cooled engine, twin cylinders; double jet carburetter; three speeds and reverse, gate change; wheelbase, 9ft.; track, 3ft. 10in.; weight of chassis, 5½ cwt.; side by side.

WILTON CYCLE AND MOTOR Co., Wilton Road, S.W.—This Wilton cyclecar is staged in an incomplete form, without engine or gear box, as it could not be got ready in time. The general specification of this vehicle is as follows: New J.A.P. 9 h.p. twin-cylinder engine, with overhead valves. The ignition is by Bosch magneto. The carburetter is of the double jet type, operated by accelerator pedal from the footboard. The lubrication is by sight feed drip and hand pump. The petrol tank forms part of the scuttle dash. The gear box contains three speeds and reverse, operated by gate change lever, with direct drive on top gear. The transmission is through the gear box to bevel-driven rear axle, the bevel drive being contained in a special cast steel outer casing; the differential is of spur type contained in a forged steel casing. The frame is built up of inverted "U" section pressed steel, with semi-elliptic springs in front and threequarter elliptical at the rear. The steering gear is of worm and segment type, and the brakes are internal expanding, both acting on the rear wheels, one brake being operated by pedal and the other by hand lever. Wire wheels are used, fitted with 700 mm. tyres. Judging by the inspection of the unfinished product, it is likely to prove very substantial, being well and soundly constructed.

Nansen, Barker & Co.'s four-wheeled "Tiny car," which is extremely low built.

## ACCESSORIES OF THE SHOW

Sydney R. Jones

ACCLES AND POLLOCK, Oldbury, Birmingham (No. 200).—are showing handle-bars and seat-pillars of all sizes and types. The chief items of interest to the ordinary purchaser are various types of box spanners, one being of a particularly neat form in which the tommy bar is riveted permanently into the box spanner. It is of short length and can easily be stowed away in the toolbag. Another type of spanner shown is the Ferret, which consists of a special set of box spanners, together with a ratchet device.

ARMSTRONG THREE SPEED GEAR CO., Birmingham (No. 177).—The Armstrong hub is shown in three patterns. Mark 5 has the normal gear on the middle ratio as before, but it is now made to start with the back wheel on the ground. Mark 6, a new motor cycle gear, has the direct drive on top and gives reductions of 65% and 130% through one train of wheels for the middle gear, and two for the low. Mark 10 is a special cyclecar gear for a combined chain and belt drive on similar lines, but more strongly built. To facilitate adjustments on all models there is a hole in the gear quadrant, and a small screw carried in the top of the handle, when placed in this hole, holds the gear in neutral position. The back wheel should then be quite free with the clutch in engagement.

## BATES HEAVY TYRES.

W. AND A. BATES, St. Mary's Mills, Leicester (No. 70).—The Bates tyre, which was introduced last year, is now made in three weights. No. 1, suitable for solo work on machines up to 3½ h.p. No. 2, specially heavy on three-ply canvas suitable for twins and sidecar work, and the extra special heavy on four-ply canvas suitable for cyclecars and heavy sidecar work. A motor cycle belt which has been well tested is introduced for the first time. Motor cycle tubes both ordinary and butt-ended are shown in all sizes.

REST AND LLOYD, Handsworth, Birmingham (No. 246).—This exhibit consists mostly of lubricating devices, several of which have been previously described and illustrated in our pages. A new accessory at the Show is the throttle controlled type of engine lubricator, which provides for a varied supply of oil according to the load on the engine. That is to say, when the throttle is nearly closed a very small quantity of oil passes. When the throttle is fully open it alters the supply of oil to suit the conditions of the increased load or speed.

BLUMFIELD, LTD., Lower Essex Street, Birmingham (No. 248).—The features on this stand are the water-cooled engines that were designed for the Tourist Trophy Race. These are both of 3½ h.p., a twin (61.8 × 83 mm.) and a single (81.5 × 95 mm.). In the single the valves are side

by side; in the twin overhead inlet valves, worked by adjustable mechanism, are used, and the inlet passage is brought across the cylinder head from the opposite side. In the air-cooled engines slight modifications have been made, so that while air space is left between the lower parts of the valve chambers and the cylinder the cooling fins are continuous, giving greater strength with better cooling. The lubrication arrangements have also been improved, and the big end design of the twins, the possibility of seizure being reduced. These details are well shown by some sectional models. The air cooled engines are 3½ h.p. single-cylinders, 5-6 and 7-8 twin-cylinders, all with side by side valves, and the 7-8 produced especially for cyclecar work. A very neat half-scale working model of the 5 h.p. twin with a bore and stroke of 32 × 44 mm. is shown.

## PRECISION AND LOW ENGINES.

F. E. BAKER, Moleson Street, Birmingham (No. 193).—The stand of F. E. Baker, Ltd., is a particularly interesting one, as on it are shown Precision engines of all types, and it is interesting to note that all the principal engines are shown in section demonstrating the accuracy with which they are constructed. Many well-known makes of machines shown on the floor are fitted with these engines. Not the least interesting is the water-cooled Green-Precision, of which a model is shown provided with a Phelon and Moore two-speed gear, whilst the chief attraction on this stand is the Low forced induction engine which has previously been dealt with in *The Motor Cycle*. This engine is a single-cylinder, measuring 104 × 78 mm., and gives 15 h.p. Its maximum revolutions are 3,300 per minute. Forced oiling is used.

BROWN BROS., Great Eastern Street, E.C. (No. 144).—The Guillotine belt cutter is a new introduction by Brown Bros., Ltd. Reference to the sketch will show that this is a straight-bladed knife, working in guides, and forced through the belt by means of a finely-pitched screw thread. It should meet a want, as it is an inconvenient method of shortening a belt to cut it with a knife, resting the belt on some part of the frame or saddle. A large assortment of accessories is shown.

Guillotine belt punch, sold by Brown Bros.

BROWN AND BARLOW, LTD., Witton, Birmingham.—In addition to the well-known models of carburetters made by this firm, particular mention must be made of a new automatic straight through type. In this the flow of petrol is regulated by a tapered needle attached to the vertically-acting piston throttle in such a way that its position can be regulated for permanent adjustment, consequently this handle lifts with the throttle, and, as it rises up, it increases the jet opening, but at a point in the tube in which it travels is a jet hole of such a size as to meet maximum requirements, and travel beyond this point does not affect the mixture, but merely the throttle. The throttle already mentioned is operated from the handlebar. The air supply is regulated by a conical choke tube formed by a coiled spring, which permits additional air to enter between the coils, as the increasing engine speed causes it to open by suction. A feature to be noticed in these carburetters is the split pipe connections tightening up a clamping ring and screw—very simple and effective.

THE CLIPPER TYRE CO., LTD., Steelhouse Lane, Birmingham (No. 6).—The motor cycle tyre made by the Clipper Company is called the Reflex Clipper Ideal. It is built on motor car tyre lines. Other patterns of these motor cycle tyres comprise those of the rubber studded type and ribbed, both beaded edge and wired. The Clipper butt ended tubes for motor cycles are also displayed. Among motor cycle accessories may be mentioned the Silent repair outfit in a leather roll, Perfect patches, solution, inflators, rubber belts, and a complete range of motor cycle suitings. Among the latter is a new form of chest protector, and the Clipper Company show a motor cycle over boot for the first time, also a new wood rim for motor cycles, the special features and advantages of which are demonstrated at the stand.

COLSTRICTOR TYRE CO., London, E.C. (No. 69).—The motor cycle tyres shown by this firm are all of the wired-on pattern. The peculiarity of the construction is that the fabric is wrapped round the wires. The chief type shown has a groove tread.

THE COUNTY CHEMICAL CO., Bradford Street, Birmingham (No. 259).—A new metal polish in powder form, called Carshine. For use it is mixed with petrol, a tin costing sixpence making a pint of excellent metal polish. The makers point out that petrol as a polishing medium has many advantages. In ordinary metal polish a high flash point spirit must be used to enable the makers to obtain cheap railway rates. Petrol is a low flash point spirit, very pure, and producing a much better polish. It is certainly an advantage to be able to carry a polish in powder form

### The Olympia Show.—

which has merely to be mixed with a small quantity of the contents of the petrol tank to become immediately effective.

CHARLES CUTHBE, Great Eastern Street, E.C. (No. 12).—The Max Cycar tyre, which has already been described in *The Motor Cycle*, and a new cover containing 90% of pure rubber. The maker informs us that £50 will be given to anyone who can prove by analysis that the percentage of rubber in this cover is not correct. Mr. Cuthbe is also introducing a quick repair patch and a special solution.

### FIREPROOF WIND SCREENS.

DOVER, LTD., Northampton (No. 214).—In addition to the Exonite steel rims and other well-known products of this firm, the chief exhibit is the new non-inflammable Exonite wind screen for sidecar work in which the Exonite is as clear as the clearest celluloid. Its elliptical shape renders it very graceful. Sets of box spanners, pumps, and some neat black Exonite coverings for handle-bars are among other notable features in the exhibit.

A. H. Hunt's crossbar with electric light and H. H. battery for reading speedometer and route card. The H. H. match carrier may also be seen.

THE EISEMANN MAGNETO Co., Berners Street, W. (No. 169).—The Eisemann magneto illustrated on this page is suitable for  $3\frac{1}{2}$  h.p. engines, and is made waterproof throughout. It differs from other waterproof magnetos on the market, since, instead of making the joints between the magnets and the end plate waterproof by means of packing, there is a dome-shaped piece bolted to the pole pieces, underneath the magnets, and separate end plates, making a metal-faced joint and screwed to the dome cover, prevent any possibility of oil or moisture reaching the armature chamber. The new model also has a new design of pole piece, which is of the single step type, giving a very wide range of effective spark, as, although at the retard, the spark is slightly less hot than at the full advance, it is sufficiently powerful to allow the engine to be started with the lever right back. The most effective spark is obtained with this magneto five degrees before full advance, while the depreciation at full advance is only 5%.

GOODRICH TYRE Co., Golden Lane, E.C. (No. 13).—The speciality of this firm is rubber-studded tyres, in the construction of which they were early in the field. The Goodrich tyre is of very high quality, and we understand that during the 1913 season a vigorous programme has been arranged, so that a good deal

Holt's special sidecar mudguard on the Service stand.

(1) A. H. Hunt's electric lamp, showing frame work to carry H. H. dry battery. (2) The complete lamp and battery.

Kerry lamp bracket which may be adjusted to any angle.

S. Smith & Son's handle-bar stop watch.

will be heard of these tyres in various competitions.

GORTON RUBBER Co., Openshaw, Manchester (No. 7).—This firm is showing motor cycle tyres of various types and sizes. Particular care is taken in the manufacture to render these tyres both durable and serviceable.

W. H. HALLIWELL, Priory House, Coventry (No. 236).—The chief item of interest to motor cyclists on this stand is the Endrick decompressor. This is a device which fits in the inlet valve cap, the thread being made the same size as a sparking plug thread. In some engines it can be screwed in the centre of the combustion head.

THE HANOVER RUBBER Co., Goswell Road, E.C. (No. 131).—This firm specialise in the Shamrock-Gloria belts and tyres provided with heavy tread, both rubber and steel-studded. All types of rubber goods used in connection with the industry are also shown, such as pump connections, horn bulbs, lamp connections, etc.

Eisemann waterproof magneto.  
A. Dome shaped cover to armature chamber.  
B. Magneto removed. C. Contact breaker ring.

HANS RENOLD, LTD., Manchester (No. 175).—A most interesting feature of this exhibit, where the Renold chains are shown in great variety, is a show case describing and illustrating with actual parts the manufacture of the Renold chain and the testing of the materials. This involves no less than 109 processes and 6,145 operations. There is also an assortment of milling cutters for the making of sprocket wheels.

### ELECTRICAL NOVELTIES.

A. H. HUNT, Cannon Street (No. 162).—The chief feature of the exhibit is the H.H. Hellesen dry cells. During the week a certain number of these batteries will be given away free of charge under certain conditions, and a special leaflet giving full particulars of this offer can be had at the stand. This firm sell a new pattern portable electric hand lamp, consisting of a metal frame carrying a dry battery to which a lamp is fixed. This is suitable for the Flash type, which is used for motor cycles. Leather carrying cases, and also a special metal case, are supplied for carrying these batteries. Other items shown include the H.H. Morse key signalling lamp, the H.H. cyclecar switch, insulating tape in tins, high and low-tension wire, armoured gas connections, and patent combined belt purchases and cutters. For cyclecars there are steering wheels, push button switches, and tyre pumps. The H.H. matchbox for the handle-bar is a useful accessory. The matchholder is provided with an efficient clip, the matches are held down by a special clip the whole being protected by a watertight lid

**The Olympia Show.**

on which a striker is provided. Another novelty is the Maplite for lighting route cards, maps, speedometers, or watches. This is fitted with universal adjustment. A very attractive item is the new electric lamp, which is made in two sizes suitable for a motor cycle or to be used as a side lamp with sidecar or cyclecar. The finish is excellent.

CHAS. MACINTOSH AND CO., Manchester (No. 9).—This firm was one of the earliest to enter upon the manufacture of pneumatic tyres. The type shown is provided with a peculiar pattern tread, consisting of three studs followed by across, this pattern continuing round the tread. Great care is used in their manufacture, and their non-skid properties should be excellent.

MARKT AND CO., Clerkenwell Road, E.C. (No. 160).—A full range of Jones speedometers, which have been so

Markt & Co.'s cyclometer drive by means of spur gearing.

successfully used on motor cycles since their introduction into this country. The Jones was one of the earliest speedometers on the market, made suitable for motor-cycles. As this speedometer has reached a high stage of perfection no alterations have been made for 1913. A novelty will consist of a cyclometer, driven off the front wheel by means of spur gearing. Considerable difficulty has been experienced in the past in getting one of these instruments to stand the heavy work required by a motor cycle. The new model, however, instead of being driven by a star wheel and striker which used to give trouble, is now provided with a

strong gear drive, which is both smooth and steady. The star wheel mechanism, especially in cases when the instrument is placed some distance from the centre of the wheel, had to withstand very heavy shocks from the striker, which used to damage the internal gears, causing the case to open and allow wet and moisture to enter, which resulted in the ruin of the instrument. For cyclecar purposes a bracket will be provided for clamping to the steering arm. The Baby Giant pulley remover is another useful accessory shown by Markt and Co.

THE MICHELIN TYRE CO., Fulham Road, Chelsea, S.W. (No. 10).—Michelin tyres do not undergo any great alterations for 1913. For lightweight motor cycles and front wheels of machines of 3½ h.p. and upwards, the company is making a light cover with wired or beaded edges, which is shown both in trident and standard patterns. There is also a substantial cover for back wheel work of machines over 3½ h.p. The famous Michelin Semelle steel-studded leather protected cover remains as before. All types are made with both wired on and beaded edges. A new form of the standard cover will be rounded in form. As regards quality and durability Michelin tyres are second to none.

Miller lamp set.

MIDDLEMORE AND LAMPLUGH, LTD., Birmingham (No. 179).—This firm shows a good selection of saddles, toolbags, etc. Their heavy motor cycle saddle is a fine piece of work, and is particularly well sprung.

**A NOVEL REAR LIGHT.**

H. MILLER AND CO., Miller Street, Birmingham (No. 178 Gallery).—Miller's motor cycle lamp, the Cetolite, is made in two sizes, and fitted on a very substantial bracket, which can be attached to the handle-bar or handle-bar stem. Another model is designed to fit an ordinary lamp bracket. In connection with this Miller's new rear light can be used, the rubber tubing from the generator branching in two directions. This rear

light fits on the right-hand side of the handle-bar, and throws a red light to the rear, but in the day time a mirror is fitted over this to give a view of the road behind.

Miller's handle-bar red light. A mirror fits on to the lamp for use in day time.

DAVID MOSELEY AND SONS, LTD., Aldermanbury, E.C. (No. 5).—A large range of motor cycle tyres, including the Ardwick rubber-studded pattern, built up of three-ply canvas, with studded-rubber tread, and the three-ribbed pattern made in two qualities for cyclecars and also for motor cycles.

**A NEW SADDLE.**

LEATHERIES, LTD., Sampson Road North, Birmingham (No. 215).—The chief item of interest is the No. 81 Empire de Luxe saddle. The patented frame is arranged to be adjustable to any required angle. The top is a pressed steel plate comfortably padded and covered with best quality leather. The exhibit comprises valises and belt and tube cases.

THE PALMER TYRE, Shaftesbury Avenue, W. (No. 36).—Here are to be found examples of the famous Palmer cord and fabric tyres. It is interesting to note that the 3in. Palmer cord tyres entered for the tyre trial run in connection with the Six Days' Reliability Trial in the West of England this year was successful in gaining the highest possible award, which shows they have reached a high point in construction and that the material is of the best.

P. & H. black finished head lamp and generator set.

POWELL AND HANMER, Birmingham (No. 172).—A large range of the P. and H. lamps suitable for motor cycle and cyclecar use is shown here. Some of these are self-contained; in other cases the generator is separate.

PRICE'S CO., LTD., Battersea, London, S.W. (No. 146).—The usual samples of Price's lubricants, so popular with motor cyclists, consisting of Motorine C, which has proved its worth for many years; Huile de Luxe, one of the highest class lubricants on the market, on which many successes have

Complete F.R.S. electric lighting set for cyclecars, made by S. Hall and Sons.

### The Olympia Show.—

been gained both on the track and on the road; special grease for lubricating motor cycle hubs; and grease for gears of all types.

### DETACHABLE TREADS.

ALFRED ROBERTS AND SONS, LTD., Gripwell Works, Birmingham (No. 238).—Detachable studded leather bands with hooks to clip on to the beaded edge of the rim, and gaiters on the same principle for protecting the tyre outside, are features on this stand, while the Roberts reinforced liner affords useful protection on the inside. Besides this, the firm have a new motor cycle cover of special design. Their belt and the Vulco Junior tyre repair outfit also calls for remark.

Pedley rubber handle-bar grips.

SELF-SEALING RUBBER CO., LTD., Birmingham (No. 133).—A peculiarity of the Hermetic tyres is the zigzag pattern which runs round the tread. It is also shown in the form in which steel studs are placed round at intervals. The tyre is manufactured on sound lines, and is made in all sizes. Of course, a suitable tyre is made for cyclecars. Another innovation is the Hermetic belt made by a patent process. In its construction layers of wire gauze are run through the canvas, and the belt, we understand, is non-stretchable. Repair outfits, etc., are also shown.

THE SERVICE CO., LTD., High Holborn, W.C. (No. 224).—Among the most prominent of the accessories shown are a collapsible luggage box, constructed out of sheet metal. It is meant to be attached to the carrier by straps, and when folded lies completely flat on the machine. A spring footrest, the portion on which the foot rests being heavily shod with rubber; it is clipped to a tube suspended on an enclosed spring, which adds greatly to the comfort of the rider. The H.P. cyclometer transmission, which is quite a useful device, allowing the cyclometer to be easily read from the handle-bar. Map and route-card holders for military motor cyclists, but should be useful to ordinary riders. A new two-speed gear, and a handy device, consisting of two flat metal leaves, which clamp tightly over and press repair patches on to punctured tubes, and a petrol gauge. The Service Co.'s clothing exhibit is also well worthy of close inspection.

THE STERN SONNEBORN OIL CO., Royal London House, Finsbury Square, E.C. (No. 237).—The well-known brands of oils and greases which are known as Sternal. Those which interest motor cyclists most are the Sternal motor cycle oil, grease, and Sternaline for chain lubrication.

R. SURRIDGE, 58, Lomond Grove, Camberwell, S.E. (No. 21).—Holdtite patches are here shown in all sizes, also repair outfits, rubber terminals, and magneto covers. There is also a new gas lamp connection with a big bore, ensuring a steady flow of gas and a small trap or filter for preventing any moisture being carried into the burner.

H. TAYLOR AND CO., Store Street, Tottenham Court Road, W.C. (No. 166).—A notable instrument is the Robinson combined milometer and speedometer, worked by gear and flexible shaft from the front wheel, and registering up to 10,000 miles and speeds of fifty miles an hour. A red hand registers the thousandths, a black hand the hundredths, while a white pointer registers the trip. In addition to this a small inset dial records the tenths of a mile.

HERBERT TERRY AND SONS, Redditch (No. 168).—Every variety of spring is to be found here. There is also a large selection of wire controls suitable for carburettors and brake work. Special reamers are supplied for use with a taper pin sold by the firm. The valve lifters, spanners, etc., are well known.

### SPHINX PLUGS.

THE SPHINX MFG. CO., Bradford Street, Birmingham (No. 197).—Of course, the chief item of interest on this stand is the Sphinx sparking plug. This plug is made in a variety of sizes and shapes. A new terminal is shown, and a belt fastener with a hinged jaw made on the principle of lazy-tongs. The pull of the belt is sufficient to keep the joint tightly closed on to the belt. The combined belt punch and cutter is a well-made, serviceable article, and the spring handle-bar is an item we shall refer to again.

THE TORMO MFG. CO., Bunhill Row, E.C. (No. 147).—Sarolet engines,  $3\frac{1}{2}$  h.p.  $85 \times 88$  mm., mechanically operated valves, chain-driven magneto, ball bearing crankshaft; a similar engine, only with gear-driven magneto; 2 h.p. and  $2\frac{1}{2}$  h.p.,  $66 \times 72$  mm. and  $66 \times 86$  mm. respectively. The only alterations to these engines are that the magneto is gear-driven, and there is a slight modification in the timing gear. The F.S. ball bearings, which are at present fitted to many makes of motor cycles, will also be on view.

THE UNION RUBBER CO., Manchester (No. 186).—One of the most interesting exhibits to be found on this stand is the new Threo belt, which is built up of a special fabric. This is one of the most flexible rubber belts we have ever examined. The firm also make a speciality of motor cycle tyres of all types and sizes, carbide, lubrication oil, patches, gaiters, tyre stopping, etc. The repair outfit is particularly well equipped.

THE VACUUM OIL CO., Caxton House, Westminster (No. 156).—A full range of lubricating oils. Vacuum B is one of the most popular lubricants; it is a pure mineral oil of heavy body, recommended by many manufacturers of motor cycle engines and used by many prominent riders.

C. A. VANDERVELL, Acton Vale (No. 161a).—This firm specialises in electric side and head lamps which are made in several patterns. These are lit by means of a dynamo in the case of cyclecars, but for motor cycle use an accumulator is recommended. A motor cycle head lamp is fitted to a neat universal adjusted bracket, and is supplied with a 4 or 8 volt bulb. A feature of the Ruthardt C.A.V. magneto is the excellent current generated at low speeds. There is also a well finished switch board for cyclecars.

THE VILLIERS CO., Wolverhampton (No. 229).—This firm is showing the Villiers free engine hub and also the Villiers two-speed gear, which has been previously described in these pages.

WEILL BROS., LTD., Kirby Street, Hatton Garden, E.C. (No. 221), exhibit a motor cycle lighting dynamo mounted on a clip designed to be attached to the back forks. It is provided with an adjusting screw which allows the tension of the friction wheel against the tyre to be varied. The dynamo is of the permanent magnet type, and is designed

Weill Bros' motor cycle lighting dynamo.

to adjust itself to the speed of the machine; that is to say, it gives a very good light at slow speeds and yet cannot damage itself by over-running at high speeds. The armature revolves in a long plain bearing, provided with a grease cup.

### PATCHQUICK.

MESSRS. WOODGATE, Tiverton, No. 165, are showing their well-known repair patches and outfits. This specially prepared rubber is also sold in long strips of various widths which should be very useful for repairing slits and strengthening parts of the tube that may have chafed against the beads or spoke-heads. The motor cycle outfits are sold in neat leather cases complete with three tyre levers.

WOOD MILNE, LTD., Preston (No. 11).—This firm specialises in steel rubber tyres, which have established for themselves an enviable reputation during the 1912 season. These tyres are shown in all sizes suitable for motor cycles.

(Continued from page 1378.)

**Our Show Report.**

This number of *The Motor Cycle* can not only claim the largest circulation, it is the biggest number ever offered to the public in connection with motor cycle matters.

**Late Arrivals at the Show.**

As usual there were many late arrivals in the Show, most of Sunday the machines were flowing into Olympia, and some were not there on Sunday night. However, on Monday, there was only one cyclecar absent.

**I.F.M.C. Meeting.**

The Dutch M.C.C. will be represented at the meeting of the International Federation of Motor Cycle Clubs by the club president, Mr. Robert R. toe Laer, who took an active part in the English-Dutch trial in Holland last August.

**Paris Show.**

The Automobile Motor Cycle and Cycle Show at the Paris Salon will open on December 7th and remain open until December 22nd. Among the British motor cycle firms who will exhibit, either direct or through agents, are: Humber, Ltd., Douglas Bros., Triumph Cycle Co., Ltd., New Hudson Cycle Co., Ltd., etc.

**Illumination of Number Plates.**

The police have been rather active in the Coventry district lately with regard to the illumination of number plates on motor cycles. Some riders are very careless in this connection, but we know of one or two instances where men have been stopped and their names taken when the letters and figures have been easily distinguishable.

It is difficult for a motor cyclist to convince magistrates on his own testimony against that of two or three police officers that his number plate was properly illuminated, therefore the best course for a motor cyclist who is stopped is to stay where he is with the police and request them to wait also until individuals, motor cyclists or otherwise, come along who can help him with regard to evidence.

**An Officially Observed Sidecar Ride.**

On Wednesday, the 20th inst., J. T. Gibbons started on an A.C.U. officially observed ride from London to Yarmouth and back, a journey in which he should cover 1,500 miles. The original idea was to take two routes (starting on the 19th inst.), one to Norwich and the other to Yarmouth, but as he was consider-

ably delayed in starting owing to carburettor trouble he did not leave until 1.40 on the morning of the 20th to cover only one circuit. He restarted

**FUTURE EVENTS**

Nov. 25-30.—MOTOR CYCLE SHOW AT OLYMPIA.  
 „ 27.—Meeting of Club Secretaries at Olympia.  
 „ 28.—I.F.M.C. Meeting at Olympia.  
 Dec. 7.—M.C.C. Annual Dinner and Prize Distribution.  
 „ 27-28.—M.C.C. Annual Winter Run.  
 Jan. —.—A.C.U. Open Silencer Trial.

on Thursday last at 8 a.m. The ride was continued over Friday, Saturday, Monday, and Tuesday. The machine is a  $3\frac{1}{2}$  h.p. Alldays, with Millford sidecar. The equipment is as follows: Lucas lamps, Watford speedometer, Senspray carburetter, Armstrong gear, Wood-Milne tyres, Whittle belt, and U.H. magneto. The A.C.U. observer is R. W. Sprague.

**Police Traps.**

An electrically timed trap is arranged in the Burton-on-Trent neighbourhood. Machines are timed electrically and the operators are carefully disguised. Once caught in this trap, it is quite useless to fight the case.

Caution is necessary in passing through the village of Thurgoland, near Sheffield.

**R.A.C. Founder Members' Dinner.**

The pioneers of motoring will assemble at the R.A.C. on Friday next, the 29th inst., for the founder members' annual dinner. The Club was formed in 1897, and the first 300 members were styled "Founders." At the present time there are 170 left out of the original band.

**Clubs at the Show.**

The motor cycling organisations are well represented at the Show. The A.C.U. has a stand between Nos. 8 and 9 at the entrance to Prince's Rooms, where particulars regarding membership may be obtained. The A.A. and M.U. stand is No. 129a, close to Addison Road entrance. Their telephone number is 2399 Regent. It has been decided to extend the full membership to cyclecar owners for an annual subscription of half a guinea.

**Famous Machines at Olympia.**

During our survey of the motor cycle exhibits at Olympia we noticed the following machines, each meritorious in

its own way. Firstly, the  $3\frac{1}{2}$  h.p. single-cylinder Singer, on which G. E. Stanley recently broke the single-cylinder hour record. Likewise S. F. Garrett's actual record-breaking Regal-Green, on Messrs. Dunhill's stand, while the Excelsior Co. are showing one of their early models of about twelve years ago. A visitor asked the attendant on the stand what model they called it, the prompt reply was, "One of Crosbie and Blackwell's." Another machine was a  $3\frac{1}{2}$  h.p. Scott with a rifle mounted on the handle-bars, made for the Coventry Ordnance Co. On this stand was the Scott racer on which F. A. Applebee won the T.T. Race last July. Harry Long's 4 h.p. Singer is also staged.

**Show Banquet.**

The annual dinner of the Manufacturers' Union was held at the Waldorf Hotel on Friday evening last. Mr. Arthur Brampton, J.P. (president), was in the chair. After the dinner there was an excellent musical entertainment.

Mr. Edward Manville, who for six years held the presidency of the S.M.M.T., proposed the toast of "The Union." He spoke about the cyclecar, and mentioned that this vehicle caused the dividing line between motor cycle and motor car to vanish. He also spoke of the action of the Union in limiting racing and only retaining that which was really useful.

Mr. Arthur Brampton, chairman, replied.

Mr. Robert Todd, chairman of the A.C.U., proposed "The Show." Speaking of the cyclecar, he referred to it as a "hybrid," and mentioned the hours spent on defining it by the R.A.C. and A.C.U., stating that the definition came to was really no definition at all, but it was sufficient for the time being.

Mr. C. Vernon Pugh replied to this toast. He gave very interesting figures regarding exports of motor cycles. The number in 1904 was 776, which fell the next year to 688, and afterwards increased to 3,341 in 1910; 7,257 in 1911, and in the first ten months of 1912 to 10,491. Speaking of the definition of the cyclecar, he said in his opinion it should be a three or four-wheeled vehicle which followed motor cycle practice in every detail.

Mr. Harry Smith proposed the toast of "The Guests," to which Messrs. J. P. Holland and R. J. Meccredy replied. Mr. C. A. Hyde mentioned the excellent work done by Mr. Alfred Bednell, the secretary of the Union.

Colonial model P. &amp; M., which has a deep tank and a bigger ground clearance.

All-black Alldays, with two-speed gear and chain drive.

# RECORD BREAKING AT BROOKLANDS.

H. F. S. Morgan (8 h.p. Morgan runabout) at the start of his successful attempt on the hour record. He covered a few yards short of sixty miles.

**R**ECORDS are much sought after at Show time, and special efforts are being put forth to secure them. Quite a coterie of riders have made Weybridge their headquarters during the past week, and the results of their endeavours are as follow:

On Friday Hugh Gibson established two hours and 100 miles Class D (700 c.c.) sidecar records on a Bradbury standard speed model. The distance ridden in two hours was 91 miles 1,752 yards = 45.99 m.p.h. The 100 miles occupied 2h. 10m. 19s. = 46.04 m.p.h. The machine was equipped with Binks carburetter, Dunlop tyres and belt, Bosch magneto, and Bradbury sidecar, whilst Shell spirit and Wakefield Castrol oil were used. These records have yet to be confirmed by the A.C.U.

Gibson lost control of the steering at one period of the test owing to a sudden swerve loosening the handle-bar stem. One of the footrests hit a post close to the track edge, but nothing serious occurred to rider or machine.

Following in the path of the G.W.K. driver, whose record

performance of Tuesday of last week is published elsewhere in this issue, H. F. S. Morgan brought out his Morgan runabout on Saturday. He started at 2.40 p.m., in fine weather, and without a single stop put the cyclecar record figures very close to sixty miles in the hour. Mrs. Morgan and Dr. Morgan were at Brooklands to witness the attempt.

The cyclecar hour record, therefore, stood on Saturday evening last at 59 miles 1,123 yards, only 637 yards short of the coveted sixty miles in the hour. The fifty miles time was 50m. 28s. = 59.43 m.p.h. The Morgan was fitted with a V twin J.A.P. engine, 90 x 77.5 mm., with overhead valves, and had a wind-cutting single-seated body. Pratt's spirit, Castrol oil, Amac carburetter, two Continentals and one Hutchinson tyre were used. Morgan's fastest lap was at the rate of 62 m.p.h.

We understand that H. V. Colver (2½ h.p. Enfield), Axford (2½ h.p. Martin), and P. O'Donovan (2½ h.p. Singer) intend to make an attack on the six hours' Class B records during the week.

## THE INTERNATIONAL CONFERENCE.

In connection with the International Conference to be held at Olympia to-day (Thursday), at 4.30 p.m., the following delegates will attend:

**BELGIUM.**—M. Emile Benckelar, president of Committee L.V.B.; M. Fagard, president Motor Club Liegeois; M. Michant, secretary R.A.C.L.; Baron Northomb, president Commission Sportive R.A.C.B.

**CANADA.**—Mr. Wm. H. Wells, Canadian M.C.A.

**DENMARK.**—M. H. Christiansen, vice-president Danish M.C.; M. Matthiwsen, president Motor Cycle Club. Ellenham

**ENGLAND.**—Mr. E. M. P. Boileau, chairman Relations Committee of the Auto Cycle Union; Mr. T. W. Loughborough, secretary A.C.U.; Mr. Meyrick Jones, General Committee A.C.U.; Mr. G. F. Sharp, vice-president A.C.U.

**FRANCE.**—M. Longuemare, Commission Sportif A.C. de France; Mr. T. G. Fenton, Commission Sportif A.C. de France.

**HOLLAND.**—Mr. R. R. toe Laer, president N.M.V.

**ITALY.**—M. le Doct Oreste Togni, president dn Moto Club d'Italia.

**SWITZERLAND.**—M. Neher.

**U.S. OF AMERICA.**—Mr. Wm. H. Wells, Federation of American Motor Cyclists.

There will be a reception at 12.45, and lunch at the Royal Automobile Club at 1.0 p.m.

To receive the delegates at the Royal Automobile Club prior to the conference: Mr. J. W. Orde (secretary R.A.C. and chairman of the Conference), Col. H. C. L. Holden, R.A., C.B., F.R.S. (vice-president Auto-Cycle Union, representing the Royal Automobile Club, and the International Organisation of Recognised Automobile Clubs), Mr. Robert Todd (chairman Auto-Cycle Union), Major Lindsay Lloyd (vice-chairman A.C.U.), Mr. J. R. Nisbet (vice-chairman

A.C.U.), Mr. Otto Thomas (vice-chairman A.C.U.), M. Sweerts (*L'Aero*), representing the French Motor Press.

Afterwards the company will journey to Olympia on cars, arriving at 3.30 p.m.

To receive the delegates at Olympia: The Relations Committee of the Auto-Cycle Union, comprising Mr. E. M. P. Boileau (chairman), and Messrs. W. G. McMinnies, G. F. Sharp, W. Pratt, T. H. Tessier, and W. H. Wells.

A Scott with a quick firing gun of a new type, made by the Coventry Ordnance Works. The gun weighs 16 lbs. as against 48 lbs. of the ordinary type.

# Letters to the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the "Editor, The Motor Cycle," 20, Tufel Street, E.C., and should be accompanied by the writer's full name and address.

## The Godfrey-Garrett Case.

Sir,—In view of the unsatisfactory (to me) result of the last one-hour race at Brooklands, when Mr. Godfrey and I ran such a close race, and also the result of my protest when the verdict went against me, I should be glad if you would publish the following challenge, which I wish to make to Mr. Godfrey.

I would like to meet him in another one-hour race, using the identical machines that we used last. I have no doubt that the B.M.C.R.C. would be pleased to appoint a time-keeper and judge for the occasion. I am willing to race for whatever amount he likes (within reason), and also have the pleasure of saying that a challenge cup has already been offered by Mr. Wing, of the Premier Cycle Co., Ltd., and others for a race between us.

Hoping he will see his way clear to accept and fix a date, and thanking you in anticipation of your publishing this,  
S. F. GARRETT.

## Evolution of Cyclecars.

Sir,—There are now frequent letters in your paper bearing on the price of cyclecars. As an old motor cyclist, the owner-driver of a 15 h.p. car, and an engineer with a good knowledge of the costs of engineering work, may I say a few words on the matter.

Beyond confidence in the coming boom, I imagine that few manufacturers know exactly what line the demand will take as regards price. At £120 and over there is a wide range of choice for the purchaser, and for £160 he can get a motor car in miniature with all its attendant labour as regards attention required. For the man with only £80 to £90 to spend the choice is much harder, and he must see rather what he can do *without*, in order that the money may be expended in obtaining *quality* (which means freedom from subsequent annoyance) rather than quantity.

"Rusticus," for instance, can be provided with the simple equivalent of a £30 pony and trap for about £50 to £60, but will the demand be large enough to justify a manufacturer laying himself out for this class of vehicle? It would be very simple, and would probably be ideal for a large number of people. Lamps would not be included, but could be added cheaply second-hand by the purchaser of such a car and fitted by him if he is handy.

It is no use buying a complete makeshift at either £50 or £100 if it is to give trouble. The point a purchaser must watch is simplicity of construction, and his attention should rather be given to those cyclecars from which most of the features of a standard car are absent—I mean such as expensive sliding type gear boxes and differential back axles (although personally, I consider a differential to be absolutely indispensable, it can be placed more cheaply on a countershaft rather than on the axle itself). He must be content with a twin-cylinder air-cooled, or a single-cylinder water-cooled engine, and probably friction drive will give better results for a small outlay than a more or less crude three-speed and reverse gear box.

He must also be content with a simple type of body, and must remember that the more there is spent on the paint and varnish, the less will be left for essentials *under* the floorboards. Novices are apt to be led away by varnish and padded cushions, and if they have not been motor cyclists the choice for them is, indeed, a difficult one.

I am glad to see the letter from the Lanchester Co.

A. VON STRALENDORFF.

Sir,—Your article on "The Evolution of Cyclecars" is particularly *apropos* just now, when a new name and much revived interest is being bestowed on that handy little vehicle. It is, of course, abundantly evident to those of us who have been in the motor movement for any length of time, that only the name of the cyclecar is new; the machine itself, as you so truly point out, has been gradually evolved from the Quad of 1899. It is equally obvious that those who know so little of motor history as to claim that the cyclecar was "discovered" two years ago, are mere babes in motor lore: their experience apparently goes no further back than to the introduction of the Bedelia in 1910.

The writer of your article mentioned that he went through the 1,000 miles trial of 1900 on an air-cooled Quad; I remember him well. I myself took part in that historical event on a 3½ h.p. air-cooled Decauville, a little vehicle which would to-day be called a cyclecar. Later—1902-3—I had a lot of fun with a 5 h.p. Clement. The author omits (probably through lack of space, rather than the fault of forgetfulness) reference to the Victoria Combination, two specimens of which participated in the 1,000 miles of 1900; as did a Gladiator and a M.C.C. Triumph. Also, what about the Jackson three-wheeler, the Yankee Buckboard, and the four-wheeled, single-seated De Dion spiler, on which Mr Chas. Jarrott used to whiz about the country? The young hopefuls who have "arrived" during the last couple of years know not these; and the other ancestors of the machine which they have just "discovered!"  
H. W. BARTLETT.

## Fair Treatment.

Sir,—I was pleased to see the Rev. W. A. Douglas Hamilton's letter in your issue of the 14th inst. I think the incident quoted and also the following ought to be taken to heart by the manufacturers. Some months ago a small crack appeared in the crank case of my 1910 Pradbury at the front frame lug, and at the makers' request I sent the machine to them for inspection. They repaired it with a new 1911 crank case and frame, put in new valves, made several other minor improvements, and returned the machine to me promptly looking like new. The whole of this was done free of charge. I also find the same firm send all renewals by return of post, and as ordered, which is quite as important.

Of course, I have no interest in the firm, but I do appreciate their businesslike methods as well as the excellence of their machine.  
F. E. PETT.

## The Wear of Small Engines.

Sir,—I read Mr. Claude Middleton's letter in your issue of the 14th inst with great surprise, and must say my experience with a Douglas is quite contrary to his.

Five years ago I bought one of the first Douglas motors and have been running it continually since, and have covered at least 25,000 miles with it.

I have not had any occasion to have either new cylinders or pistons fitted. The only replacements to the engine so far have been new rings and two exhaust valves, and bushing flywheel side of engine, which has altogether cost me thirty-five shillings.

I have a great number of friends who ride Douglas machines, and their experience is similar to mine.

I can only come to the conclusion that Mr. Middleton must have under-lubricated his engine.

W. H. KIDDELL.

### Tyre Wear.

Sir,—I should be grateful if any of your readers can help me out of a difficulty. The tyres on the back wheel of my 4 h.p. motor cycle (used with sidecar) give way very quickly close to the bead. What can I do to prevent this?

AN OLD READER.

### Sidecar Brakes.

Sir,—There appears to be an increasing inclination in some quarters towards the fitting of a brake to the sidecar wheel. At first sight this doubtless appears admirable, as the elaboration of the sidecar emphasises the desirability of efficient brake power.

I venture to think that the suggestion is a mistake. Already the stresses to which the forward members and attachment parts of the sidecar chassis are subjected are very severe. Many of the modern underhung sidecars have the weight carried too far forward on the back axle. Braking resistance, should brakes be fitted, will also be imposed upon the forward members of the chassis, adding an altogether new and unfair strain upon the often overloaded forward tubes.

Experience seems to prove that with reasonable care in driving the extra brake is unnecessary, and it appears to me that it will only be an added source of danger to sidecar users.

SIDECAR.

### Wear of Small Engines.

Sir,—I read "Ixion's" remarkable example and the unfortunate experience of Mr. Claude Middleton in your issue of the 14th inst. with great interest.

During the latter part of this year I have been using a similar machine (new), and for the first thousand miles purposely kept the engine on the point of smoking, then began to reduce the oil supply to normal, but soon had trouble.

I found by experiment that with the sight feed set to drip slowly only one quarter of the oil out of the pump reached the engine, the remainder leaking back to the tank, and this is written to warn others, novices especially, not to trust merely to seeing some oil dripping.

The old-fashioned outside oil pump with two-way tap has given me more satisfaction than the enclosed tapless pattern.

J. I. HUNTER.

Sir,—Referring to "Ixion's" remarks quoting experiences of the above, I beg to say that I know Mr. Hutchison's machine. Without wishing to detract from the very creditable performance of the Douglas motor cycle, I feel obliged to criticise the figures quoted. Nothing was spent on belts, but Mr. Hutchison omitted to state that he had two in use all the season, and that, whilst both may be good for further use, they are nearing the end of their lives. All was not right in the gear box "about 2,000 miles ago" (if I may coin an expression), and no mention is made of its journey to the works at Bristol, where a ball race and a clutch lining were replaced, albeit free of charge, by the makers.

One new tyre was purchased, but no account was taken of an old spare cover which shod the front wheel while the original front tyre did its share of back wheel work.

I confirm the statement about the life of the chain, but only the frequent and thorough cleansing it received at Mr. Hutchison's hands enabled it to run so long. Another Douglas under my observation wore a chain to destruction in 4,000 miles. It was cleaned and lubricated twice. Mr. Hutchison cleans and lubricates his chain every four hundred miles; the result, after 5,800 miles, is the pitch is not yet too great to prevent further use.

In submitting details of costs, the temptation to suppress items which are likely to make the performance of a machine good instead of extraordinarily fine is great, and perhaps pardonable, but false impressions and dissatisfaction are generated thereby in the minds of novices and inexperienced riders.

H. M. STICH.

Sir,—In re Mr. Middleton's letter in your issue of the 14th inst., giving his experience of the Douglas motor bicycle, I think a word of protest is necessary, as such a letter, however truthful, is apt to create a wrong impression. I do not know how Mr. Middleton treats his machine, but I have used Douglas motor cycles for the past four years and have never yet experienced a breakage in a vital part. Last year my mileage was about 4,000, and I required two fork

springs, one sparking plug, and one back cover. This year my mileage has been just over 2,000, and I have not spent a penny on replacements or repairs. My sole trouble has been one puncture. I have not had a plug out or taken the belt off. I ride in all sorts of weather, using Eli Clark's mud-shield both in summer and in winter. I average between twenty-five and thirty miles an hour; but I give the machine fair play as regards lubrication, and I never run on full throttle. The only trouble that the machine gives me is cleaning, but it is a trouble that I evade as much as possible. Clark's shield keeps the engine clean, and the rest does not matter very much. I never grind in valves nor amuse myself taking the engines to pieces, for the machine always runs faster than I have any need for. But I have no doubt that I could abuse it and smash it up if I wanted to; but I don't.

G. A. MACKAY.

Sir,—When writing the footnote to my letter kindly published in your issue of November 14th, you no doubt took it for granted that the big-end seizures were due to insufficient lubrication (and you therefore assume that I have under-lubricated always), whereas they were owing to the firm who had ground down the steps to take up wear making one big-end very tight. The engine consequently was given lots of oil—in fact the belt was brought to slipping point by the liquid shower from the rear silencer. (Most machines would have stopped with plug trouble.) However, it seized—the first time within a mile of starting up.

Under normal circumstances I have lubricated according to the makers' instructions, but lately I have periodically augmented the regular doses by giving extra charges until the smoking point is just reached.

CLAUDE MIDDLETON.

[We are obliged to hold over many other letters received on the subject of "Wear of Small Engines."—Ed.]

### Hoods and Screens on Cyclecars.

Sir,—On reading the article "Accessories for Passenger Motor Cycles," by Mr. B. H. Davies, in your issue of November 14th, I was thunderstruck to gather from the writer's remarks that the cyclecar is incapable of affording proper weather protection by means of efficient hood and screen. This is the very point where a great many people had hoped to find the cyclecar scoring over the motor cycle and sidecar, and certainly I was about to purchase one for this advantage alone.

Surely for many years past now 6 h.p. and 8 h.p. small cars, such as the Rover and Swift, have been giving great satisfaction fully equipped with proper hoods and screens so as to render them weatherproof.

Now, if such a small car can carry hood and screen and yet not be "stopped down to a crawl" by the wind resistance,

AN AMATEUR'S ACHIEVEMENT IN 1912.

D. S. Kapadia who has had a remarkable run of successes on his 8 h.p. Rex-Jap during 1912. In Essex Motor Club contests he won three cups, two gold, six silver, and one bronze medal, the contests including hill climbs, reliability trials, a sidecar race at Brooklands, and a speed-judging contest.

then a cyclecar, with its much lighter chassis and body, ought to be still better able to carry such accessories and maintain a fair speed. I consider this a vital point, and one which ought to be settled without delay, as if it is a fact that a cyclecar of, say, 8 h.p., is incapable of travelling at fair speed on average roads with hood and screen up to protect passengers from the storm, then, in my opinion, one-half of its advantages are lost.

If this is not a fact, I think that the article is one which is likely to mislead.

H. H. S. TEMPLETON, M.R.C.S., L.R.C.P.

### The Unborn Runabout.

Sir,—I have read with interest "Ixion's" article *re* the above, in your issue of November 14th. The matter being one of greatest interest to the average public, I beg leave to encroach on your valuable space sufficiently to detail a personal experience. At the commencement of 1911, I drew out plans for a cyclecar almost identical with that required by the "old josses," and approached many firms with a view to manufacture. I was informed in every instance that the power and speed were too low to appeal to the public, viz., the "knots." Not to be outdone, however, I have myself constructed a cyclecar: 4 h.p. air-cooled engine, sociable seats, four wheels, direct raked steering, etc., the total cost to me being £31. The runabout is capable of an average of eighteen miles per hour, and will climb almost anything with two up. I have now driven this runabout over 4,000 miles, and have still the same 700 x 45 tyres, that seem little the worse for wear. I venture to think that it is not only possible, but probable, that a similar type will soon appear on the market at a price ranging around £55, now that the testing has proved so satisfactory.

This being so, there is no reason why those with an average pocket, content with an average speed, should not shortly find their want filled.

CYCLECARIST.

### Silencers.

Sir,—I have been interested in articles you have recently had in your admirable paper on silencers. I read them carefully, and from the data your contributor gave I believe I have turned out a simple cut-outless exhaust. One of the most persistent demands has been for a long pipe. In the accompanying photograph of my silencer there is 12 ft. of lin. pipe. Another requirement is large cooling surface. This silencer has 420 square inches entirely exposed to the surrounding air. The pipe is made of very thin steel, and its construction naturally lends itself to radiating the heat, thus cooling the gas within.

A long silencer pipe of flexible metallic tubing tried by a reader.

In practice I find the sound as quiet as any silencer with cut-out closed, and this without any baffle plates or a flattened end to the pipe. Also, the end of the pipe keeps almost dead cold.

E. A. DAVIES.

Sir,—From time to time silencers are brought out which embody novel principles as regards obtaining silence, with lack of back pressure, but it may safely be claimed that this silencer belongs to a class apart. At first sight it may

appear to defeat its own object, but a study of the principles of its action will justify the claims made for it.

It consists essentially of a close-coiled spring which is firmly attached at one end to the exhaust pipe of the engine. The free end of the spring is plugged up by a special plug, and there we have the silencer complete.

SPRING FOR CUT-OUT

The action is as follows: Just previous to the opening of the exhaust valve, the plugged spring effectually seals up the exhaust pipe from the atmosphere. The first rush of the expanded gases down the exhaust pipe blows open the spring, which is set at just the right tension, and in opening exposes a path to the gases quite sufficient for them to escape without back pressure. The instant that the flow of gas diminishes, the spring closes with a snap, and leaves a partial vacuum in the exhaust pipe. Thus, it will readily be seen, has the effect of assisting the exhaust of the succeeding stroke.

The secret of the silencer's success is that the exhaust gases are split up by the manifold coils of the spring. The temper of the spring is by no means impaired by the heat of the exhaust, as after several hours' continuous running it is possible to bear one's hand on the coils.

As the engine under test ran better with a pair of these silencers than with the standard pattern, it has not been found necessary to fit a cut-out. Should, however, the rider prefer one, it can easily be adapted as shown. In this case the fitting of an adjustable external spring puts a ready means to the rider's hand of trying his engine under different tensions of spring.

Several of these silencers have been made, and found to work satisfactorily, and the idea is provisionally protected.

H. H. PIKE.

### Cyclecar Definition.

Sir,—There seems to be a lot of controversy as to what constitutes a car on cycle lines. By taking the words separately, "cycle" indicates lightness. Now the lighter (consistent with strength) this cycle is made the less energy or force is required to propel it, hence lightness must be one of the cyclecar's features. I think everybody accepts the word "car" as meaning "something comfortable to ride in," so from the above the only possible definition of cyclecar is a vehicle light, cheap, comfortable, and accessible. Personally, I do not think there will be any great rush on the manufacturers' part to put cars in miniature on the market, as there is a limit to all things. If they do, and the public do not respond so readily as expected, manufacturers can acknowledge that they did not gauge the market correctly.

Simplicity is the key to everything, and I fail to see how you attain that end in a four-cylinder with its dozens of small parts, also gear box and live axle. The two latter fittings I will acknowledge, provided they are well designed, give no room for anxiety as to their reliability. Then there is the water cooling with joints and radiator. No, I do not think the motor car in miniature can be classed as a cyclecar.

My experience, and I know that one or two manufacturers will agree with me, is that the cyclecar of the future can only be on sociable-seated lines. Air-cooled twin-cylinder engine with ample power (8 h.p.), two speeds, with chain from engine to counter-shaft, thence by belts to back wheels. A differential is essential to any vehicle with a track of over 3 ft. Change of gears, etc., through variable pulleys, will soon give way to chain drives of the P and M, and Enfield types, as belts run best in perfect alignment, they also have a knack of slipping when not wanted to.

By the way, what about the compulsory reverse in these so-called cyclecars that weigh, it seems, anything from 5 cwt. to 12 cwt.? Have they one in truth or only in mind?

HAROLD E. DEW.

# A Tour in Switzerland

**B**EING in possession of the International Traveling Pass and Special Customs Card prepared by the R.A.C., I started from Folkestone on my 600 miles journey to Switzerland and crossed the Channel on a sunny October day at 12 noon. I reached Boulogne at 1.30 p.m., and had no trouble in getting through the Customs thanks to my papers and the kind assistance of the R.A.C. representative. I had taken the precaution of supplying myself with all the necessary tools and spare parts, such as plugs, tubes, springs for front forks, belt, etc., including a spare ordinary pulley in place of which a Mabon clutch was fitted. My luggage weighed 40 kilogs., and owing to the great weight of my machine a charge of 12s. 6d. was made for it. The first two or three villages gave me a good idea of French roads, which for some miles were terribly rough, and this was no doubt caused by the French road races, and I really

imagined that I should never reach Paris without breaking all the springs of my machine. However, fortunately for me everything went well for the first day, and I reached Abbeville at 5.30 p.m., and having decided to stop there put up at the Hotel de la France, where I took my first continental dinner.

## Abbeville to Paris, 104 Miles.

The next day, with the intention of reaching Paris in the afternoon, and after supplying myself with petrol and looking carefully over all the parts of my machine, I started at 8 a.m. for the capital. After travelling for fifty-three miles I arrived safely at Beauvais at 10.45 without the slightest incident happening. From there I intended to reach Pontoise about 1 p.m., which is twenty miles from Paris. However, the old adage "Man proposes and God disposes" applied in this case, and soon after I left Beauvais the weather

A winding mountain pass eight miles long, between Besancon and Pontarlier.

On the shores of the Lake of Geneva.

The writer and his Bat-Jap.

## A Tour in Switzerland.—

changed and it started raining, and did not cease all the day, but being determined to reach my destination I journeyed on slowly but carefully, my Lomax on the rear wheel acting for the first time as a non-skid. On reaching Meru I decided to have luncheon and an hour's rest, hoping by that time that perhaps the rain would have ceased, but my lucky star was not in the ascendant, for the weather did not change at all that day. However, I started on my journey again and reached Pontoise at 4 p.m. My desire was to reach Paris before nightfall, but I had little idea of what those odd twenty-one miles meant, and I had to ride along the worst roads that I have ever seen, and in some parts

Hotel opposite the Gare du Nord, and at 8.30 I was dressed and ready to sit down to a well-deserved dinner with my friends. The next morning I got up early to see about my machine and to take it through Paris as early as possible, intending to start for Switzerland the next day. But once more fate was against me, and I had to wait three more days until the sun once more was visible, and then I started from Bezons at 8.30 a.m. for Paris. At the Porte Maillot and at every other entrance to Paris all petrol-driven vehicles have to stop, in order to pay duty on the petrol in their tanks. For every litre a charge of 20 ct. (2d.) is made, which is returned on leaving Paris by any of the gates. Having passed the Arc de

On the pass to Chamonix, with  
Mont Blanc in the background.

The straight road, about fifty  
kilometres long, between Sionne  
and Vitry-le-Francois.

The pretty village of Ornans behind Besançon. The houses in the background are all built as in Venice, a river flowing between them.

A view of Chamonix, showing the snow-clad mountains.

they were so terribly bad that I had to ride on the footpath, but, of course, I was careful not to be caught by the police. Once I had to dismount when a farmer came along and put his walking stick in front of my machine.

After this little incident nothing more exciting happened, and I reached Bezons (eight miles from Paris) about 6 p.m. I knew it would be unwise at that time of night to ride through the thickest part of the traffic over greasy roads, so I put up my machine at the nearest place, which I took to be a garage, but which turned out to be a stable. Then, taking the next train to Paris, I put up at the New

Triomphe, down the well-known Champs Elysée, to the Place de la Concorde, and then to the Rue de Rivoli, I stopped to take some refreshment. It is no easy task to take an 8 h.p. machine across Paris, and immediately a curious crowd surrounded my machine, nearly stopping the traffic on the pavement. There were taxicab drivers, butcher boys, bicyclists, men of every age and condition, asking numerous questions in regard to h.p., make of machine, maximum speed, clutch, etc. There was no doubt about the admiration of my machine, and remarks such as "splendid," "wonderful piece of work," etc., were numerous. After giving a man the desired address of the agent

**A Tour in Switzerland.—**

in England of my Jones speedometer, I continued my journey through Paris. I carefully studied the map supplied by the R.A.C., and soon found my way to the Place de la Bastille, and passed through the thickest traffic I had ever been in. At last I reached the Porte Daumesnil, at the other end of the city, and there put up my machine until the next morning, intending to start as early as possible. The distance so far was 166 miles, which my speedometer registered exactly.

**Paris to Vitry-le-Francois, 109 Miles.**

After a hearty adieu to the proprietor of the garage, the owner of an old-fashioned  $3\frac{1}{2}$  h.p. machine, I made straight for Porte Daumesnil to get my 40c. back, paid the day before for duty on entering Paris. At 10 a.m. I had left Paris behind me, but only to encounter some more vile *pavé* for another seventeen miles until I reached Tournan, the end of the "Environ de Paris." It being a cold morning, I stopped there for a cup of coffee.

On looking over my route again on the famous "Carte Taride," I found to my joy that no more cobbles were indicated, except, of course, in and out of towns. Thinking that this was a chance for getting compensated a little for the bad roads passed on the other side of Paris, and without experiencing any notable incident I reached Sézanne (fifty-one miles) in time for luncheon, reaching Vitry-le-François about 5 p.m. Having travelled 109 miles, I decided to stay there and continue my journey the next morning. While examining the nuts of my machine, I found my trip indicator only showed sixty-one miles, but soon discovered that the little driving wheel on the front wheel was too high, and would not catch properly, which was probably caused through a knock whilst riding over the cobbles. That had been my best day's run up till then, having had a splendid straight road, the "Route Nationale" between Sézanne and Vitry being absolutely straight. My machine mounted the hills in such a splendid way that it seemed almost as if there were no hills at all, and I had done the right thing in getting an 8 h.p. machine, despite the increased cost of running, which is the only disadvantage against many advantages. Travelling between thirty and forty miles an hour over a good road really feels like sitting in a Pullman car.

Then followed a good dinner in the Hotel de la Cloche. Dinner in France is usually served between 6 and 8 p.m. at a fixed price ranging from 1f. 50c. to 3f. 50c., according to the class of hotel, and wine is included. The habitual drink is claret, which in that part of France is served one bottle for each person. Coffee is supplied in all the hotels, but is usually taken in a *café* near by. The breakfast is plain, consisting of coffee and milk, rolls and butter. Luncheon is usually served between 1 and 2 p.m., and is the same as dinner, excluding soup.

**Vitry-le-Francois to St. Dizier, 18 Miles.**

The next morning I decided to reach Besançon (129 miles), but, alas! the sky was grey with clouds, and it poured with rain all the way to St. Dizier (eighteen miles). Then, having waited in vain for the chance of better weather, I decided to stay in St. Dizier for the night.

**St. Dizier to Pontarlier, 130 Miles.**

Having started early to make up for lost time and being favoured with sunshine, I reached Chaumont at 9 a.m. and Langres at 9.40 a.m. That was one of the prettiest runs I had had so far, there being a splendid view from the top of the hill, looking down to the source of the Marne and the picturesque valley below. By a special signpost motorists are requested to drive slowly—partly on account of the wonderful scenery. I did not stop long in Langres, having to make up for previous stoppages. My route now lay through some more picturesque valleys to Gray—twenty miles. That place is well known by its *ruines féodales* and the pretty Forest de Bellecombe. Having lunched here, I started for Besançon at 2.30 p.m. This town has 50,000 inhabitants and is of great historic interest, especially from the date of the Revolution. It is a wonderful sight—the town being surrounded by high forts and gates. One can still see the citadel, which is the big military prison. After taking a snapshot of the forts from below, I tried to find my way to Pontarlier, the frontier of Switzerland and France. I wanted to reach Pontarlier before sunset, but I did not know that I had to go over a winding mountain pass about twelve kilometres long, over which it is impossible to exceed a speed of twelve miles an hour.

It being rather misry I could not take any snapshots after passing Besançon, but it was a very curious sensation to feel the cold Swiss mountain air creeping up my knees. Before reaching Pontarlier I found the clutch slipping and the engine going much too quickly compared with the speed. Thinking the clutch had been lubricated rather too much, I went on, reaching Pontarlier just before lighting-up time. I put up at the Hotel de la Poste, and then enjoyed a splendid French dinner. I was near my destination, having only thirty-two miles to go.

**Pontarlier—Yverdon.**

Next day I started, at 9.30 a.m., having plenty of time to spare to reach Yverdon in time for luncheon. I had to pass the frontier at Vallorbe, but my clutch gave me some more trouble when I was seven miles out of Pontarlier. After waiting more than two hours in trying to adjust it, I found out that the clutch was ruined by too much slipping, and there was nothing else to do but to change the clutch with the ordinary pulley, but that operation was easier said than done, for the nut would not come off in spite of my efforts. After some trouble the clutch was re-assembled, and I went back to Pontarlier to obtain a key to enable me to remove the nut. The manager of the cycle shop promised me to have it done in about twenty minutes, but that twenty minutes was extended to nearly two hours, as he had to make a key from an old bicycle tube.

At 3 p.m. I left Pontarlier once more, and at 3.40 I stopped in front of the Douane Française, the Swiss being ten yards further on. I had no trouble on the French side, but the Swiss Douane officer took about forty-five minutes to fill in the *visa de l'entrée en Suisse* in my I.T. pass. But everything comes to an end, and so did my journey, my destination being reached at 5.30 p.m.—a journey of thirty-two miles taking eight hours.

Scenes on tour.

I have been round the Lake of Geneva and to Chamonix, the nearest town to Mont Blanc, one of the prettiest excursions, provided the roads are dry. There are about fifteen kilometres of constant climbing over a mountain pass, but my machine—geared  $4\frac{1}{4}$  to 1—arrived at the top as if it had done five miles on the level ground. On my arrival there I heard that I was the rider of the first English motor cycle to visit Chamonix. I took my way back after a three days' visit over Chatelard, Vernayaz, Montreux, and Lausanne. At Chatelard I heard, to my horror, that there was no suitable road from there to Vernayaz. There are two ways out, and a Swiss *douane* officer told me I would have to take the Funiculaire to Vernayaz or go back the same way to Geneva. I decided on the first, and, after two hours' waiting, my machine was put inside the only waggon. I did not regret having taken this way, as it was a most delightful journey of seventy-five minutes over the mountains to Vernayaz. From there I continued my journey and reached Lausanne the same evening. I have made numerous little excursions from Montreux up to Caux (4,000 feet), Yverdon St. Croix (the winter resort of many Englishmen), and round the Lake of Neuchâtel—a delightful excursion.

There is no doubt from my experience that England is far ahead of any other European country in the making of motor cycles, not only in design, but in workmanship in general.

"TWIN."

## LIGHTING BYELAWS.

IT is a very great pity that it should be possible for county and borough councils to make byelaws concerning the lighting and other regulations governing motor cycles. At the present time we have a very complex set of laws and regulations concerning motor vehicles generally, and even a legal mind is often puzzled to know just exactly how the various acts and byelaws apply.

For instance, as mentioned recently, there is a byelaw in existence in Glamorganshire which compels sidecarists to carry two lights showing the full width of the vehicle. This byelaw is a supplement to the Lights on Vehicles Act (1907), and in the text it is particularly pointed out that it shall apply to every sort of vehicle except bicycles, tricycles (other than motor tricycles), or velocipedes. It would, therefore, appear that the byelaw has been particularly framed to deal with sidecars and all vehicles wider than a motor bicycle.

The above byelaw was amended as recently as the 11th inst. so as to require vehicles such as sidecars to carry lamps showing a red light to the rear as well as two lights showing the full width of the combination. Now red rear lights or reflex rear lights are excellent safeguards, but what we should like to see would be an Act making it universally compulsory to carry red rear lights and lights showing the full width of every vehicle with more than a single track. We always

recommend sidecarists to carry lights showing the full width of the vehicle, both for the safety of others and for their own safety's sake.

When regulations regarding lighting become universal there could be no complaint, but when one county applies it to one type of machine and a handful of counties apply the reflex rear light byelaw to some road vehicles and not to others, it becomes extremely difficult to comply with the law, and it is particularly hard on touring motor cyclists who may through ignorance of the law fail to carry these lights. In their own district there may be no compulsion to do so, and there are apparently no steps taken to advertise the byelaws outside the district to which they apply. Presuming that a London or Midland motorist was on tour in Glamorganshire with a sidecar with a single front or side light and no rear light, he would be liable to be summoned and fined up to 40s. and costs for the first offence and £5 for the second or subsequent conviction. He might have no idea that byelaws existed on the subject, and he runs into the arms of the law without the slightest knowledge of having infringed it.

At the present time the reflex rear light byelaws only apply to about six counties, and are not compulsory on pedal cycles or motor cycles. We see no reason why they should not apply to every vehicle. Decentralisation is at the bottom of the trouble.

# QUESTIONS and REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Choice of Machine.

? I have on order (unless I change my mind) a 1913 model 3½ h.p. Rover, F.E., with Sturmey-Archer gear. I want a machine to take any hill without having to rush, and, most probably, a sidecar attachment on occasion. I do not intend to do any riding in wet weather, but, of course, one may have from time to time to ride on wet roads, especially patches in the winter. (1.) What tyre would you advise—one rubber or steel-studded? I want the one least inclined to skid. (2.) Would you prefer the Armstrong gear, or is there nothing to choose between them now? Both starting off the ground. (3.) What do you think the most comfortable saddle? Brooks pan is supplied, I believe. (4.) I see the high gear is just double the low, ranging from 3, 4½, 6, to 7, 10½, 14. What gears would you advise for my purpose? I do not want great speed.—W.R.M.

The machine would do exactly what you require. (1.) We should recommend good tyres, made by a reputable firm. Rubber and steel-studded combination tyres are satisfactory. (2.) Either of the two gears would suit your purpose; both are excellent. (3.) Brooks pan seat is most comfortable, and highly to be recommended. We should recommend 4, 6, and 8 as suitable gears. You can, of course, further vary this with the aid of the adjustable pulley.

## Lights on Sidecars.

? I was fined 5s., including costs, and licence to be endorsed, for driving a motor cycle and sidecar without having a light on the sidecar, and my licence was also endorsed for failure to produce same to the police constable. Had the magistrates the power, in the first case, so to endorse licence, as the summons is under a byelaw and not under the Motor Act? In my opinion, they have exceeded their power. In the second case, the offence was quite a technical one, which could have been met with a small fine, and did not warrant at all an endorsement of the licence.—D.C.W.

Our legal adviser writes: "With regard to the points raised by 'D.C.W.' as to endorsing his licence, this matter of endorsement is not one in the discretion of the magistrates, but it has to be done where the person is convicted of any offence under the Motor Car Act, or of any offence in connection with the driving of a motor car other than a first or second offence for exceeding the speed limit. Driving a motor cycle without having a proper light is an offence in connection with driving, and failing to produce the licence is an offence under the Motor Car Act, so that these convictions would have to be endorsed. The byelaw, a copy of which was sent, does not in any way affect the question of lights on motor cycles. The byelaws

sent are made under the Lights on Vehicles Act, 1907, and it is expressly provided that that Act is not to apply to cycles or motor cars, and therefore cannot apply to motor cycles. I have heard from the Clerk to the Justices in connection with the conviction at Llandaff. He does not enclose a copy of the byelaw, but states that some few months ago a similar summons was issued against another person, and the matter was taken up by one of the automobile associations, and at their request the hearing was adjourned in order that they might consider the question. Ultimately the Society intimated that they did not intend to proceed with the defence, and the defendant was fined in the ordinary course."

## Misfires Except at Full Throttle.

? I am the rider of a Motosacoche motor cycle, and I can't get the machine to run satisfactorily unless the throttle is full open. At intervals there occurs a sharp, snappy explosion different from the regular explosions of the engine. It occurs more often if I close the throttle a little. The machine has an automatic carburettor and a.o.i.v.—F.E.P.

The carburettor appears to be generally disarranged. It should be taken down and carefully examined. You will probably find that the union of the inlet pipe is loose and the engine is taking in too much air. This would account for the symptoms of which you complain. Also see if the inlet valve is working properly.

## Dry Battery Ignition.

? I am contemplating the purchase of one of the original Rover motor cycles, date about 1906, chain drive, i.e., 1911 B. and B. carburettor, and m.o. valves. Can you answer me the following questions: (1.) Considering it in good order, what, approximately, should be the price? (2.) Is accumulator ignition good enough? (3.) Would Hellenes dry battery be better? (4.) Can the same coil be used?—R.M.A.

(1.) The machine should be worth about £10. (2.) Accumulator ignition is satisfactory so long as the accumulators are kept well charged, but accumulators are troublesome. (3.) Dry battery ignition is less trouble and more satisfactory if used with a non-trembler coil. (4.) The same coil can be used provided that it is a non-trembler one. It would be advisable to get it tested.

Three-quarter front view of the four-wheeled Crouch Carrette. It was described in "The Motor Cycle" of Oct. 31st. The Crouch is not in the Show but is available for trial runs in the vicinity.

B. Fleet to Harwich.

?

Will you please forward to me my best route from Byfleet, Surrey, to Harwich, avoiding London?—A.M.C.

Your best route would be as follows: Byfleet, Weybridge, Oatlands Park, Sunbury, past the Brown Bear, Hanworth. At Oxford Arms turn left, and go straight through till you reach Hounslow, past the Duke of Wellington Inn. From this point follow the route marked blue on the "R.A.C. Official Map of Recommended Routes round London" (obtainable from these offices, price 1s. 7d. post free). If you follow this right round, it will eventually bring you out at Chingford Green; here take the left-hand fork, and go through Epping, Ongar, Chelmsford, Witham, Colchester and Manningtree to Harwich.

#### Carrying a Child on a Motor Cycle.

2

I recently purchased a 2 h.p. Humber lightweight motor (new). I have taken my little boy, eight years of age, for short rides on the luggage carrier. I folded a soft cushion and strapped it on, and made stirrups for his feet, with a long rug strap, and he enjoys the rides very much. My friends say it is very dangerous, and would be likely to cause a deslip. (1.) Kindly say if you think this a safe way to carry a child. (2.) Would you suggest any other method? The machine is too light for a sidecar.—C.E.S.

(1.) We should say that it is certainly dangerous to take a child in this way. (2.) There is really no way of carrying a child safely on a motor cycle. A sidecar is the only really safe method, and, of course, a 2 h.p. machine is not suitable for this. One cannot deny the fact that a motor cycle is prone to sideslip, and if the machine did slip with a child on the carrier, the consequences might be very serious indeed.

#### Loss of Power.

?

I am experiencing a peculiar fault with my  $3\frac{1}{2}$  h.p. Minerva tricar. The chief trouble is that for some time now the engine has been in the habit of suddenly pulling up as if it was overheated or the carburetter choked, which is not the case. This sometimes occurs perhaps every two miles, another time it will go perhaps eight miles. Sometimes on a slight rise the engine gives up, and another time it will go up all right. It used to run well with the Minerva-Longuemare carburetter, which was fitted to it when new, but that has worn out, so I have fitted a 1911 B. and B. The engine is a 1904 m.o.v.; the compression is good. It pulls up with a sucking noise as if choked, piston and rings good fit, all bearings and bushes good, gudgeon pin good fit, machine starts off at once after pulling up, valves lift properly, new springs and valves, new bell crank and new cams have been fitted, smallest jet in carburetter No. 26, battery ignition, which I consider to be in perfect order. Timing: exhaust valve opens  $\frac{1}{16}$  in. from bottom of firing stroke, and inlet opens just as the piston gets to the top. The engine gets its oil properly, and I have tried various sparking plugs. I have tried placing the coils in petrol pipe in different positions; in fact, the machine

has been to two garages but is no better. The engine is cooled by blowers from the front of carriage. I have re-wired the ignition. I have had the machine since it was new and know what it can do."—D.G.

It is difficult to form any definite opinion re  $3\frac{1}{2}$  h.p. Minerva tricar without seeing the machine, but it looks as if the trouble with the engine lay either in the ignition or carburation. As accumulator ignition is used, it is possible that the batteries are showing a false voltage (a dry battery will sometimes show quite a fictitious reading when current is quite insufficient to produce a satisfactory spark), and so run down after the first mile or so, otherwise it looks as if the carburetter were at fault. Another possible cause might lie in the valves. Is there space between the tappets and the bottom of the valve stems to allow for their expansion under heat? A No. 26 jet is on the small side. Try a No. 31

#### Cost of Motor Cycle in New Zealand.

?

I believe it is possible to avail oneself of your deposit system for the purchase of motor cycles or goods. Does your department undertake to choose a second-hand machine? I see so many bargains advertised by firms in your paper, such as clearing shop-soiled and slightly ridden motor cycles of each previous year's design. In the event of my getting a new motor cycle, would you ascertain whether the different firms would send out the machine as received from the manufacturer for export? I have seen Triumphs arriving here beautifully packed—the engine unit with magneto all fitted together, and the frame and tyres, etc., in pieces ready to be bolted together. My reason for this question is that we do not have to pay duty on the engine, or magneto, or gear, as it is classed as chassis of car. We pay twenty per cent. on British-built cycle parts. The firms out here charge far too much. On free engine Triumph

they charge £80; on two-speed Douglas, £70. Compare these with the home prices. What are the charges—freight, insurance, and packing—to New Zealand on (1) Douglas two-speed or (2) Triumph F.E.?—A.H.A.V. (New Zealand).

We greatly regret we cannot choose a second-hand machine for you. If, however you desire it, we shall be pleased to recommend you a reliable firm who make a speciality of this work. We have often done this sort of thing for our Colonial readers. The cost of exporting a machine to New Zealand is 51s. 6d., including packing in a crate and collecting within four miles of the Bank of England.

#### READER'S REPLY.

Starting in Cold Weather.

A flannel soaked in boiling water and wrapped around carburetter and induction pipe will help vaporisation in cold weather. Extreme care must be taken to prevent water entering the float chamber.—W.A.H.

#### EXPERIENCES WANTED.

"R.H.A." (Dunmow).—6 h.p. Zenith, particularly with regard to reliability of belt transmission.

"P.G." (Dublin).—2 $\frac{3}{4}$  h.p. Douglas light touring model, average speed on long journeys, steadiness in grease, and reliability.

"S.R." (Fulham).—6 h.p. Zenith, 8 h.p. Williamson, and 8 h.p. No. 7 Chater-Lea with sidecar, particularly as regards tyres, belts, chains, and petrol consumption.

"P.J.B." (Dublin).—1913 8 h.p. Matchless, two speeds, chain drive. Consumption, reliability, and wear of tyres.

"J.H." (Lurgan).—2 $\frac{3}{4}$  h.p. 1912 Gamage. Speed, flexibility of engine, and general reliability.

A letter addressed to W. F. Winn-Jones, 34, St. Mary Axe, E.C., has been returned marked "Not known." If Mr. Jones will send his correct address a reply to his query will be forwarded.

A SINGLE-CYLINDER SIDECAR OUTFIT.

The  $\frac{1}{2}$  h.p. three-speed Dene-Precision sidecar outfit. The bicycle is a sturdy built mount specially designed for sidecar work. Features are the kick-starter and footboards.

### Amateur Workshops.

The Society of Model and Experimental Engineers (secretary H. G. Riddle, 27, Minard Road, Hither Green, S.E.) has a good workshop. The society welcomes motor cyclists who have no opportunity of getting repairs done and who have no proper workshop of their own. The annual subscription is half a guinea.

### A "Twin Screw" Motor Cycle.

The following is a cutting from a Rangoon paper: "For Sale, just landed, one Douglas 2½ h.p. 'twin screw' motor cycle." The Rangoon motor cyclist who has sent us the paragraph says that he thinks perhaps a "twin screw" motor cycle will be a curiosity even to us.

### A Motor Attachment.

The Cross and City Garages, Southgate Street, Gloucester, have introduced a motor set for attaching to pedal bicycles. The engine is one horse-power, magneto ignited, and has a single lever automatic carburetter. The set comprises engine, magneto, carburetter, petrol and oil tanks, and all pipes required; also the control levers, belt rim with spoke clips, jockey pulley, and twisted hide belt and fastener. The attachment fits midway in the frame, and engine is vertically placed.

### Paraffin Carburetters for Motor Cycles.

The Stewart-Precision Carburetter Co., Ltd., 199, Piccadilly, W., inform us that they are conducting experiments with a paraffin carburetter for motor cycles. The Stewart-Morris paraffin carburetter is already a success on cars, and has been tested under R.A.C. observation. The company is prepared to guarantee that the use of paraffin will not soot up plugs or cylinders to a greater degree than is associated with a well tuned engine burning petrol.

### Of Interest to Traders.

A case of interest to retail traders is that of W. Naylor, Anstey, near Leicester, who was summoned for failing to close his shop for the serving of customers one afternoon in the week at one o'clock, except for the sale of motor cycle and aircraft supplies and accessories to travellers. The defendant said that garages did not close, and he was under the impression that if he sold nothing except petrol, oil, and carbide he was complying with the law. He was ordered to pay the costs, in default five days' imprisonment.

### A Cyclecar Competition.

It is not every day that one has an opportunity of winning a cyclecar, but such is presented to all our readers by the makers of the John Bull cross groove tyre—the Leicester Rubber Co. The period of the competition extends from January 1st to September 30th, 1913, and the prize—any standard British-built cyclecar fitted with John Bull tyres and not exceeding a total value of £125—is offered for the nearest estimate of the average mileage covered by competitors during that time. Between the dates named every John Bull T.T. cover sold will have attached thereto a voting card and mileage chart, and a condition fixed by the manufacturers is that competitors must record their back wheel mileage. Complete details can be obtained from the manufacturers, whose address is Granby Rubber Works, Leicester.

## SPARKLETS

### Lancashire Motor Cyclist's Appointment.

Mr. S. W. Phillpott, the organising secretary of the Liverpool Auto Cycle Club's open hill-climb, and well known in connection with his series of consistent successes in important motor cycle competitions during the last year, has resigned his position with Messrs. Henry Whitlock and Co. in order to take up the management of the Mead Cycle Co.'s motor department at 11-13, Paradise Street, Liverpool. Mr. Phillpott will be at Olympia, and will be pleased to meet old friends and past competitors there. Communications should be addressed to him c/o Messrs. C. Macintosh and Co., Ltd. (Stand No. 9), where appointments may be made. The Mead Cycle Co. have already fixed several important sole agencies.

### A Differential Counter-shaft.

The Contrast differential counter-shaft, made by Denby and Co., Contrast Works, Ilkley, is composed of two hollow shafts which telescope one into the other. The outer shaft is driven by belt, through the pulley E (chain or gear can also be used), and carries at each end a fixed flange. The inner shaft slides endwise and rotates with the outer one, but projects at each end, and there carries two other flanges which are adjustable. This combination of inner and outer shafts and flanges forms at each end of the shaft a V pulley. It will, therefore, be seen that when the flanges are closed at one end the groove in the opposite pulley is widened.

The differential action works as follows. On turning a corner to the left the resistance of the road wheels causes the belt to climb up the right hand pulley, the flanges close and raise the gear. The corresponding action increases the width of the left hand flange and lowers the gear on the other side, and when a corner is taken to the right the action is reversed. The makers inform us that the device works well, and when turning corners one belt can be distinctly seen to rise, and the other to fall in the pulley grooves.

Denby's cyclecar axle. An ingenious method of overcoming the balance geared pinion type of axle.

A. Frame bracket.  
B. Outer shaft.

C. Outer flange.  
D. Adjustable pulley nut.

E. Variable gear flanges.  
F. Inner flange.

### Trade Notes.

Mills-Fulford, Coventry, the makers of the Millford sidecars have received an apology for infringement of their patented and registered design for commercial sidecar chassis from T. Cadby and Sons, Birmingham.

The tool and accessory business lately carried on by R. Broadhurst, 25, Smithford Street, Coventry, is now transferred to 130, Queen Victoria Road, Coventry, where the business will be continued under the style of R. Broadhurst and Co., and under the sole management of Mr. R. Broadhurst. A 1913 catalogue is now ready.

Mr. W. Ivy Rogers informs us that he is not the proprietor of the Autocrat Light Car Co., the makers of the Autocrat cyclecar, and is only responsible for the design.

Cass's Motor Mart, 5, Warren Street, Euston Road, N.W., inform us that they have been appointed sole agents for Trump-Japs for London and district, and a representative will be in attendance on the Trump stand during the Show.

### A Company Matter.

Prices' Co., Ltd., is the new title of Prices' Patent Candle Co., Ltd., which company has now acquired the business, goodwill, and premises of Charles Price and Co.

### Catalogue Received.

"Douglas Motor Cycles of 1913" is quite a bulky little volume, containing illustrations of the various Douglas models with complete specifications and prices. A number of detail particulars are well illustrated by means of half-tone blocks, such as the mudguarding, lamp bracket, carburetter, valve gearing, and two-speed gear. An excellent line drawing is also published showing the engine in part section, with all the various working parts numbered; on the right of this is a price list of all the spare parts. The same applies to the gear, carburetter, pedalling gear, etc. Then follows a list of Douglas successes, illustrated with excellent photographs, some of which have appeared in our pages. The booklet can be obtained from Douglas Bros., Kingswood, Bristol.

# The All-British "J.A.P." ENGINE

SECURES THREE IMPORTANT EVENTS

## At BROOKLANDS, on Nov. 9th.

**One Hour Cyclecar Race**, won by H. F. S. Morgan, on Morgan Runabout with J.A.P. Engine, who also made the

**ONE HOUR CYCLECAR RECORD,  
and 50 MILES** .. ..

### Junior Hour Race

won by  
H. Mason,  
on  
N.U.T. with  
J.A.P.  
Engine.

### Three-lap Race

won by  
H. Reid  
on DOT  
with  
J.A.P. Engine.

**The Engine that ENSURES Success.**  
Mr. H. F. S. Morgan on Morgan-J.A.P. Runabout,  
winner of Hour Cyclecar Race.

Nov. 16th, 1912.

J. A. Prestwich, Esq.

Dear Sir,

I am pleased to be able to tell you that I was successful in doing a non-stop engine run from London to Edinburgh, and maintaining an average of 20 m.p.h. This was done under the most trying weather conditions, as it was blowing a gale and raining hard. However, I think it only fair to tell you that the engine ran splendidly throughout, there being no sign of overheating, knocking, or loss of power even after she had been running for 19 hours.

I remain,

Faithfully yours,

(Signed) F. BEGLEY.

## A FEW RECENT J.A.P. SUCCESSES:

**A Non-stop Engine Run**—F. Begley, on 6 h.p. Enfield and Sidecar, fitted with J.A.P. Engine, made a non-stop Engine Run from London to Edinburgh in 19 hours 56 minutes.

### AT BROOKLANDS.

Mr. Hugh Mason, riding a 2½ h.p. N.U.T. with J.A.P. engine, finished **second** in the **Junior T.T. Race**.

3 to 9 hours' Cyclecar Record set up on Duo Cyclecar with J.A.P. engine.

### AT CANNING TOWN.

1 to 6 hours' record set up on a Martin Lightweight with J.A.P. engine.

When ordering your 1913 Motor Cycle, Sidecar, or Cyclecar, specify the famous J.A.P.

**J. A. PRESTWICH & CO.,** Northumberland Park, Lower  
Tottenham, LONDON, N.

Telephone: Tottenham 1612 (3 lines).

J.A.P. Engines can be obtained from stock from ROBERTSON'S MOTOR AGENCY, 157, Gt. Portland Street, W.

### IN SCOTTISH TRIALS.

**ONE GOLD MEDAL** and **TWO BRONZE MEDALS** won by machines with J.A.P. engines.

### IN A.C.U. ONE DAY TRIAL.

A Morgan Runabout with J.A.P. engine made a non-stop run.

### IN A.C.U. SIX DAYS' TRIALS.

Machines with J.A.P. engines won **FOUR SPECIAL PRIZES, SEVEN GOLD MEDALS, and FOUR SILVER MEDALS.**

# ROYAL ENFIELD

*"Made like  
a Gun."*

Ten models of the Royal Enfield chain-driven motor cycles, each fitted with the Enfield patent Two-speed and Free-engine countershaft gear, will be exhibited at Olympia; and there our staff will gladly demonstrate the points of superiority embodied in these machines.

## OLYMPIA - STAND 101

The special 1913 features and improvements embodied in the Royal Enfield models were fully described in last week's issue of "The Motor Cycle." These new features will be found on the models at Olympia—and the Royal Enfield preliminary Motor Catalogue for 1913 should be in the hands of every motor cyclist engaged in the selection of a new machine for the coming season. *Write to Dept. F. for a copy of the catalogue.*

### World's Endurance Record on

#### "WOOD-MILNES."

What stronger evidence of the reliability of **Wood-Milne Motor Cycle Tyres** than Mr. Harry Long's 30,000 miles ride—the world's long distance sidecar record? 1 sidecar tyre 16,000 miles, 2 back-driving tyres 5,000 miles apiece, 2 front tyres 8,000 miles each. 20,000 miles in 20 weeks. 1,576 miles in 12 days. 5,000 miles in 33 days, round the coast of Ireland!

### World's Speed Record on

#### "WOOD-MILNES."

Mr. S. F. Garrett, using the same set of **Wood-Milne Tyres** each day, broke the World's Record on Oct. 11th and 12th, for 3½ h.p. machine and sidecar. He rode a Regal Green Precision. First day, 1 and 2 hours' records and 50 miles records. Second day, 1 hour and 50 miles record again. Mr. Garrett, whose time averaged 4 miles an hour better than the previous World's best, writes:—"Strength, speediness, and wearing qualities are excellent."

**30,000 Miles - 34 weeks. Record beaten by 4 miles per hour.**

**MOTOR CYCLISTS—PLEASE NOTE!!!**

**COPY OF LETTER.**

From THE NEW ROVER CYCLE CO., LTD., 86, N. J. R. Hummerland St., NEWCASTLE-ON-TYNE.

Messrs. Nicole, Nielsen & Co., Ltd., 14, Soho Square, London, W. Oct. 28th, 1912.

Dear Sirs—I have much pleasure in enclosing cheque in payment of the enclosed account. I have now given your Speedometer a pretty severe test and must candidly say it is far superior to any other I have had, which include every speedometer of note. Where yours scores over the others is, the milo meter is most accurate and the speed hand is as firm as a rock when running at any speed. With the other makes I have had it has been really impossible to know what speed you were going at on account of the hand shaking all over the place.

Yours faithfully (Signed) J. ADAMS.

## PRICES—

Type 706. 3in. dial - - - - - £3 : 3 : 0

Indicates speeds to 60 miles per hour, with total mileage counter to 10,000 miles.

Type 702 (as illustrated) - - - - - £4 : 4 : 0

Indicates speeds to 60 miles per hour, with total mileage counter to 10,000 miles.

# A Cycle Can Free

That's the prize we offer to the winner of the

## John Bull Mileage Competition

and below is the Coupon that will bring you full particulars.

You know we've stated many times that the John Bull "means more mileage"—

Our competition is designed to prove it and, with so handsome a reward as a British-built Cyclecar shod with John Bull tyres, and costing anything up to £125, during 1913 thousands will be helping us to do it.

The result will prove the John Bull's superiority—of that we are convinced.

More, it will reveal the exceptional merit of the compressed rubber tread, which is an exclusive feature of the

## John Bull Cross Groove Tyre.

Such proof will mean a widening popularity—that's our reward, and yours—a greatly increased Tyre economy and the prospect of a handsome prize.

Now, remember, you can see the John Bull at

**Olympia, Stand 137,**

also that details of the competition will be sent gratis on receipt of attached Coupon.

Post it now!

## Future Olympia Shows.

**T**HE Olympia Show is over and is unlikely to be repeated until November next year. It has been a successful exhibition, and reflects great credit on those responsible for it. The attendance was a record, on one day alone 6,000 more people paid for admission than at any previous motor cycle exhibition, and overcrowding occurred practically all the week. Almost every day it was difficult to obtain a good and close scrutiny of the more interesting machines on the stands, and many must have gone away without examining some of the most attractive mounts solely on account of the crowds around them rendering them inaccessible. The crowding in the gangways was almost as bad as at the Car Show of the previous fortnight, and if the Show is to be made more comfortable another year the exhibitors' space, already rather restricted in many cases, must be still further curtailed and the gangways widened. There should be no difficulty in coming to some amicable arrangement by which the largest firms should be confined to an exhibition of one each of their standard models. That is if Olympia is to be the venue in 1913. There is some talk of a larger building being erected, and unless this be done drastic alterations will be necessary in the stand arrangements.

The Show is a popular meeting ground at an admission fee of 1s., and large numbers of tickets are given away by exhibitors to agents and prospective customers. The supply of these should be restricted, and the reduced prices to clubs might be withheld another year.

On all sides we hear good business has resulted, but the bulk of our readers will be interested to know when they will be able to obtain the machines they have ordered, and those who have not yet ordered or seen a 1913 model will like to know when the agents in their respective districts will have the article of their choice or fancy ready for inspection.

Most of the large firms making motor bicycles and sidecars are ready for practically immediate delivery, but many of the cyclecars shown were "firsts" and properly tested duplicates in most cases will be some months before they materialise.

This prompts us to give a few words of advice. To those who have been well satisfied this year with a motor bicycle and sidecar we say order another in preference to waiting till the spring for delivery of a machine which may not be ready even by that time. To those who have decided they must have the

comfort and protection of a four-wheeler with enclosed body, and who cannot obtain the article they want before May or June, we advise the purchase of a sidecar combination in the interval in preference to being without a mount during the best part of the riding season. To the makers whose cyclecars are yet untried we urge the necessity of entering them in all the possible competitions to show the public what they can do. The Sutton Coldfield Club will hold a members' trial confined to cycle cars this month, and there is also the Motor Cycling Club run from London to Exeter and back over hilly country at Christmas; we hope to see several cycle cars in these events, and shall take particular note of their performances.

## Cyclecar Test on Brooklands.

**I**T has been urged, and quite reasonably, that a prolonged race or test on Brooklands would give an excellent idea as to what a cyclecar is capable of. We are speaking now of those which have not yet won their spurs, and we would suggest that during what we will term, for want of a better name, the off season, a prolonged test might be made, open to makers of four-wheeled cyclecars. Nothing would be easier than to set each entrant to drive a lap at his top speed, and let this be the set average speed to be attained in a six hours' test, machines which fell below the set average to lose a mark for every mile or fraction of a mile per hour below the average. Nothing finds out faults so well as high speeds at Brooklands. A long distance trial on the road would better test mudguarding of transmissions, but we should at least ascertain which is the best type of cooling, and whether chassis parts and springing would stand a six hours' run all out with two passengers and standard frame, engine, etc. Perhaps a better method of arriving at the average speed would be to take the present hour record speed for a four-wheeled cyclecar and allot speeds in accordance with the cubical capacity of the engine.

An organised competition on the lines suggested, if taken in hand by the B.M.C.R.C. or A.C.U., would settle a good many doubts as to the capabilities of machines now being offered, and provide data as to consumption, speed, and reliability which would otherwise be unobtainable until the spring of the year or even later, when the A.C.U. and other long distance road trials are held.

# CLUB MEETING AT OLYMPIA.

The Ruling Body seeks to Encourage the Private Owner.

**A**T the General Committee meeting of the A.C.U., held at Olympia on the 27th ult., it was agreed that during 1913 the policy of the Union in regard to open competitions should be to grant permits to responsible clubs, in accordance with the Competition Rules of the Union, and subject to the following conditions being complied with, either (a) that the meeting for which the permit is sought shall be wholly "expert barred" or (b) that at least fifty per cent. of the events at any meeting shall be restricted to "novices," whilst, in the case of those meetings comprising a single event, such as a reliability trial, a separate set of awards shall be made for experts and novices.

## Classification of Competition Riders.

**DEFINITIONS.**—The following definitions and rulings as to the classification of competitors were agreed upon:

1. That no event at any meeting shall be "novice barred."
2. That unless at least six entries are received in any event the same shall be cancelled.
3. That wins at one meeting become operative at subsequent meetings only.

4. That all competitors on the register of the Union on January 1st, 1912, and all who have since that date been registered, shall be classified as "novices," except that competitors who have during 1912, or who shall subsequently, in any twelve months ending December 31st, win in open competition either two first or four seconds, or one first and two seconds (or the equivalent of such wins as may be decided by the Union and announced upon the grant of permit), shall be classified as "experts."

5. That an "expert" who does not compete in any open competition during twelve months shall revert to the "novice" class.

6. That an "expert" who, having failed to win a first or second prize in open competition during any twelve months, may, on application being made to the Union, be allowed to revert to the "novice" class.

## Meeting of Club Secretaries.

After this meeting, a meeting of club secretaries was held in the Pillar Hall, with a view to fixing up dates for events during 1913. The Chairman (Mr. J. R. Nisbet) went into a full explanation of the new policy regarding the classification of riders for open events. This policy was practically self-explanatory, and after Mr. Nisbet had gone through the points one by one very few questions were asked. Mr. Nisbet pointed out that the Union had been forced to define its policy in this respect through the difficulty the clubs had found in giving sufficient encouragement to inexperienced riders. He also announced that a list of experts, as defined by the above definition, would be published by the A.C.U. Mr. W. B. Little congratulated those who had drafted the scheme, and stated that he regarded the difficulty as being solved in a satisfactory manner; in fact, he gathered from the feeling of those present that this was the case. Here Mr. W. H. Browne remarked that the scheme was due to Mr. Loughborough, secretary of the A.C.U.

## Twenty-six Clubs Represented.

About twenty-six clubs were represented as follows: The Liverpool A.C.C., Mid-Bucks M.C.C., Dublin and District M.C.C., North Middlesex M.C.C., Oxford M.C.C., Sutton Coldfield and District M.C.C., Birmingham M.C.C., Cheltenham and District M.C.C., Leicester M.C.C., Streatham M.C.C., Coventry and Warwickshire M.C.C., Essex M.C.C., Cumberland M.C.C., Westmorland M.C.C., Woolwich M.C.C., Purley and District M.C.C., Chesterfield M.C.C., Notts and District M.C.C., Bristol M.C.C., Surrey M.C.C., and Bristol C. and M.C. In the room a large black-board was divided into spaces giving the various Saturdays throughout 1913, on which were marked the various dates engaged by the A.C.U. for their trials. The spaces were then filled in, and the following list of 1913 events was compiled:

## Diary of Events in 1913.

Jan.	18th.	North Middlesex M.C.C. Open Trial.
Feb.	8th.	Liverpool A.C.C. Trial.
"	15th.	Sutton Coldfield A.C. One-day Trial.
Mar.	1st.	A.C.U. One-day Trial.
"	8th.	Herts M.C.C. and East Midland Centre A.C.U.

OCCASIONAL  
COMMENTSBY  
"IXION"**Keynotes of Olympia.**

Outside the experimental boom in cyclecars, I notice how thoroughly the Show endorses the policy and opinions advocated by this paper since its inception. To-day I find myself almost a doyen of the motor cycle press, and I well recall the abuse and vilifications undergone by some of my *confrères* and myself for having ten years or more ago deprecated attempts to produce an 80 lb. lightweight, and for having preached variable gears in season and out of season. To-day variable gears are universal, and the 80 lb. lightweight is as far from solving our problems as ever it was. In reality there has been very little reduction of weights. In 1902 and 1903 I rode and owned machines which weighed less than 130 lbs. all on; in fact, I possessed four different makes of this class. Two years ago it looked as if 120 lb. machines might oust the heavy  $3\frac{1}{2}$  h.p. roadsters, but since then there has been a general advance of weight in most classes. The original  $2\frac{1}{2}$ - $2\frac{3}{4}$  h.p. types have been loaded up with heavier frames, heavier engines, change-speed gears, free engines, spring forks, bigger carriers, tool bags, tanks, etc., until there are few left which do not scale about 160 lbs. ready for the road, while the  $3\frac{1}{2}$  h.p., similarly caparisoned, has advanced beyond the 200 lb. mark, and in trials, with a week's equipment, often scales 230 lbs. or even 250 lbs. These facts confirm my old ruling principle that nobody particularly minds what a machine weighs so long as the machine can always propel its own weight sufficiently. We may get down to a truly efficient 80 lb. or 100 lb. machine some day, but the time is not in sight yet. And, oh, those variable gears! At Olympia I met leading manufacturers who used to cut me, or write vituperative letters, signed and unsigned, because we denied that a 4 to 1 gear, behind, say, a  $75 \times 80$  mm. engine, was efficient for a go-anywhere tourist. To-day they are all tumbling over each other to improve their variable gears! Then some fools say the press is an incubus.

I venture to think also that my predictions regarding

the future of the cyclecar will come true. I mentioned a week or two ago that the speed brigade are being studied too much in connection with the design and horse-power of small runabouts, and that the public would buy when these machines have been tried out. Probably I got cursed for my pains, but if there be an unhealthy rush for cyclecars I for one shall be sorry.

**The Gear of the Future.**

Continuing Cassandra's rôle, I venture to prophesy that out of the seething welter of variable gears the counter-shaft three-speed is likely to be the immediate survivor. I even expect it to be the dominant note of the 1913 Show. I do not say there are many samples of the type which I dare purchase to-day. It is a novelty, and a drop of canny Scots' blood trickling down from a remote ancestor, induces me to let others do most of the experimenting for me. I know the hub gear is sound all through. It wears a season, it very seldom gives trouble, and the engine can stand four miles of it with the throttle wide open and the pulley right down. This is good enough for the time being. But if the future can offer me a gear which removes 10 lbs. weight to the centre of the wheelbase, and permits me to drop out my back wheel in a couple of minutes, after a few leisurely twists of a single spanner and a swift juggle with a belt-hook, I should be a fool to refuse such an ideal. When the same design includes a two-step drive, incorporating a belt which will wear twice as long as my present drive, and seldom slip to the point of non-propulsion, why, I grow rapturous. My secret petition to the trade, once more, is that they will "try out," as the Yankees say, the inclusion of a bevel-shaft as the primary item of a two-step drive. I always thought there were possibilities about the shaft, and I fancy it is in this respect that they may ultimately be realised. Meantime, hats off to the three-speed hub! It is a contingency we under-valued when we were recovering the balls of the old experimental change-speed hubs from a mile of road with nettlesome ditches on both sides.

Two variably-g geared show models.  $2\frac{1}{2}$  h.p. standard Motococycle and  $6\frac{1}{2}$  h.p. (two-speed) N.S.U. with spring frame.

# A November Trip on a Humberette.

A Strenuous Week-end of Nearly 500 Miles.

LATELY we have had experience of the running and management of the Humberette, the design of which is no doubt familiar to our readers, a detailed description having already been published in these columns. Our initial test of the little car was in the Midlands, the biggest hills within easy reach of Coventry, such as Edge, Sunrising, and Warming-ton, being easily accounted for. We have, in fact, seen a Humberette climb Sunrising with four up, and restart with the same load on the steepest gradient at the top. Of course the question on everybody's lips in examining a cyclecar with air-cooled engine is, "Does the engine overheat?" No matter where you go you are bound to hear the subject broached. Why? Because it has been the custom in the past for engine makers to design an engine of a certain capacity, and no matter what ratio of compression it possessed or how big the flywheels employed, it was used for all sorts of conditions, and frequently for purposes for which it was ill-suited. The result was "pink hot" engines, broken valves—mainly owing to the heat—excessive oil consumption, and so on.

Now, however, it is generally realised that for success the engine must be designed from the first for the particular work it is expected to perform. This simple fact was patent to Messrs. Humber, Ltd., when they decided to market a runabout, which explains why the 8 h.p. twin-cylinder air-cooled engine of 84 mm. bore and 90 mm. stroke is able to keep cool on long-distance runs without any artificial methods of cooling. It has a low compression enabling it to run cool, and heavy flywheels ensuring flexibility, this being most marked at slow speeds.

## A Complete Equipment.

A very smart vehicle complete with hood, screen, lamps with generators charged, and all necessary tools was placed at our disposal, and very brief instructions were needed to send us happy on our way. Though a throttle

lever is provided on the steering column, a foot accelerator is all one need be concerned with. The magneto lever does help occasionally at slow speeds in traffic or on a hill, but once set needs no attention. We found gear changing quite easy and the clutch sweet in action, whilst we must particularly express appreciation regarding the power of the brakes. The steering required a few miles practice before getting really accustomed to the car, for it is much more sensitive than the average, only a slight movement of the wheel altering the track of the machine. The metal steering wheel, too, we found very icy on a cold day; if the writer had a

Humberette he would wrap cord around the wheel rim. This, however, is a detail. The more important question of reliability most concerned us, and we are able to say that no trouble whatever was experienced from start to finish. The engine pulls excellently, climbing most ordinary rises on top gear, and though it is quiet when on the move, we can quite believe that springs under the tappets would effect a further improvement.

The consumption of petrol is approximately forty-two miles to the gallon on long give-and-take runs, which must be considered excellent. An automatic drip-feed lubricator is used, with a hand pump as reserve, which is most necessary, as we found in cold weather that the engine vacuum was insufficient to induce thick oil to flow through the pipes. A pump every six miles is enough for ordinary conditions.

The engine is not addicted to sooting up its plugs; twice we over-lubricated and caused the engine to smoke badly, but it seemed to like it. The four-jet carburetter left little to be desired. Occasionally one could detect a suspicion of choking if the accelerator were suddenly depressed, but it was only momentary.

## A Longer Test in Lakeland.

On a subsequent week-end we had an extended trial of the car at the invitation of the Humber Co.

Near the top of Sunrising.

The twisty ascent of Tow Top near Kendal.

**A November Trip on a Humberette.—**

Just how many air-cooled four-wheelers can account for the four real test hills included in the A.C.U. Autumn Trial course it would be interesting to know. We refer to Tow Top, Gummers How, Red Bank, and Kirkstone Pass. Certainly the trial itself helped us but little to answer the query, for the Humberette was the only one of its type entered, and that machine was unfortunate in suffering from a slipping clutch. The vehicle used was the one the firm has tested for upwards of 10,000 miles over all sorts of roads, and the clutch leather had just worn down to a point which caused the inner member to bear on the nuts at the back of the outer portion. After fitting a new clutch leather, it was resolved to give the Humberette another trial with the same gear ratios, and we were invited to observe the run, though it was more in the nature of a private trial to test the low gear ratio on the steepest of hills. The car will subsequently be sent into Devonshire to be tested over the Minehead-Ilfracombe stretch. When S. Wright picked us up at Coventry on the Saturday morning he talked of being home again the next evening, though we had our misgivings with a journey of nearly 500 miles

before us. We need not dwell on the run through Lancashire, for there was little of incident to chronicle, nor need we do more than repeat that the good impressions we formed of the springing, general comfort, and handiness of the car on the occasion of our initial run were amply sustained. Driving in

Climbing Red Bank in the pouring rain.

The stony surface of Gummers How, a comparatively unknown but long trying ascent. Lake Windermere in the background.

**A November Trip on a Humberette.—**

turns, we actually reached Warrington (100 miles approximately) in 3h. 35m., which surprised us both in view of the heavy state of the roads in parts. We intended to avoid the tramlines and travel *via* Ormskirk and Rainhill, but a necessary call at Blackburn upset our plans. We lit lamps at Preston, where it commenced to rain, finally reaching Kendal in good time. Incidentally, it may be of interest to prospective cyclecar owners to know that a couple of King of the Road motor cycle head lamps answer splendidly. We had ours low down near the front axle, where they were more useful than on the dashboard, though the glass doors get splashed.

**Tow Top Climbed.**

It was still raining when we set out for Tow Top next morning, but we were cosy and dry under the hood. Substituting a bigger jet for the smallest of the four, and making sure that we left a blue trail astern, we commenced the steep climb over the stone track, swinging round the first hairpin at a good twelve miles per hour. This time the engine made no mistake, the clutch held perfectly, and our worthy driver was soon wearing a more contented expression as the engine tugged gamely with the hill summit in sight. Continuing our way to Gummars How over roads now thick in mud, we were both impressed by the severity of this climb. However, after a cool down, we put paid to the account of Gummars How also, and, descending, hurried along the road beside Lake Windermere to Ambleside and Grasmere. How different the winter aspect in these parts! Cold and bleak, the rain falling pitilessly, and the road surface strewn with fallen leaves, the Lakes now had little attraction for us. Red Bank, with its 1 in 4 gradient, was our objective, and after Tow Top we knew that success was ours. The surface of Red Bank is splendid; in fact, it can be said to be one of the fairest test hills in the country. The ascent successfully accomplished, we returned to Ambleside for tea. By this time dusk was upon us, so we resolved to make tracks for home and drive all through the night. We got along finely, each of us being moved to comment from time to time on the roadworthiness and weatherproof qualities of the Humberette. The roads were covered with seas of water—it hardly ever stopped raining—yet we continued to average our 23 odd m.p.h. without forcing the car along.

Half an hour was spent in Kendal obtaining re-

plenishments, and then we struck out for Lancaster and Preston in the inky darkness. No incident of note occurred, though we frequently ran over branches of trees beaten down by the heavy rain and strong winds blowing from the sea. Thunder and lightning near Preston caused us to alter our plans; neither of us relished the thoughts of an all night run with flashes of lightning dancing across our path. Continuing through Wigan over indescribable surfaces to Warrington, we stayed the night, and next morning got away at nine o'clock in improved weather. It still rained in showers, so we kept the hood up. Knutsford was our first stop, to change drivers, and

A deflated tyre at Coleshill—our only road stop.

we continued at a good 33 m.p.h. bat to Stone and Lichfield. The engine continued to run faultlessly, but nearing Coleshill we noticed an ominous "bump, bump"—front tyre down. Failing to find a puncture, we re-inflated the tyre, and it remained hard. Have not tyres peculiar temperaments? The road surface to Stonebridge vies with the worst that Lancashire can produce. We reached the city of the three spires without further incident at exactly one o'clock, the week-end run totalling nearly 500 miles. By the way, it would be interesting to know if this distance has been beaten on a cyclecar in two and a half days. The experience has left us with an excellent impression of the Humberette, and especially of its reliability, comfort, and weatherproofness. G.S.

New  $4\frac{1}{2}$  h.p. single-cylinder model with chain drive and counter-shaft two-speed gear.

8-9 h.p. two-speed chain-driven Quadrant fitted with handle starter and Quadrant four-point suspension sidecar chassis.

# Passenger Machines and Fittings at The Show.

A.C. Sociable complete, fitted up with lamp, hood, and wind screen.

6 h.p. Sparkbrook sidecar model. This was described last week on page 1407 and is fitted with a twin-cylinder J.A.P. engine and the Sparkbrook two-speed gear. Note also kick-starter and combined belt and chain drive with large pulley on the counter-shaft. The machine has a most workmanlike appearance, and the sidecar, frame and attachments are particularly good.

Chater-Lea 1913 model sidecar with dropped frame. The luggage grid is a new feature of this make of sidecar.

Burelto sidecar stand.

Coach-built sidecar fitted to the 8 h.p. No. 7 Chater-Lea.

C. F. Mitchell & Co.'s V.M. tandem seat for fixing to the carrier.

Bat method of attaching brake connection.

## Four-cylinder White and Poppe Unit.

Two aspects of the new White and Poppe four-cylinder water-cooled cyclecar engine, clutch and gear box unit.

THE well-known firm of Messrs. White and Poppe, Ltd., have lately turned their attention to the light car movement, and, as was to be expected, have produced a really beautiful piece of work, which takes the form of a power unit comprising engine clutch and gear box. The engine has four cylinders cast *en bloc* with a bore and stroke of 60 x 90 mm. respectively. The valves are disposed on either side of the cylinders, the exhaust on the near and the inlet on the offside. They are operated by separate camshafts through the medium of rollers and adjustable tappets, and the valve gear is enclosed in neat aluminium covers. Both inlet and exhaust manifolds are cast with the cylinders and give the engine a symmetrical appearance. Cooling is arranged on the thermo-syphon principle, the outlet being of large diameter and considerably sloped upward. A double intake pipe is fitted, so that the water may return from each side of the radiator.

Hot air intake from exhaust branch on White and Poppe cyclecar engine.

### Design of the Interior.

The crankshaft is supported by three main bearings, and throughout the ample bearing surfaces are particularly noticeable. The bottom half of the crank case serves as an oil well and sump, and may be detached without interfering with the rest of the unit. The camshafts are driven by gears from the rear end of the crankshaft, and the crank case is extended so as to form a cover for the flywheel. To this cover is bolted the gear box casting, which contains a train of gears providing three speeds and reverse with a direct drive on top. The clutch is of the multi-plate type, having thirty-six plates carried in an extension of the flywheel, and running in oil. The lubrication is ingenious, but at the present moment we are not allowed to say more than that the oil is raised by the flywheel

and led to troughs under the big ends, thence it returns to a sump. A lead also provides oil for the gear box and even for the rear axle. A White and Poppe carburetter supplies the mixture, hot air being drawn from the exhaust pipe. The magneto lies on the near side of the engine, and is driven from a gear wheel engaging with the exhaust camshaft wheel. It is provided with a simple timing adjustment, and driven through a short length of strong coil spring, this providing a flexible joint.

Behind the gear box is mounted a universal joint enclosed in a neat spherical casting.

This power unit is constructed specially for the Morris-Oxford light car.

The chassis is on car lines throughout, and has a 7ft. wheelbase and 3ft. 4in. track. The frame is of pressed steel, the side members being quite straight but providing ample steering lock. The front axle is of I section and mounted on semi-elliptical springs, the steering being by worm and wheel. The rear axle is driven by an overhead worm, and the rear suspension is by three-quarter elliptic springs. The propeller-shaft is enclosed in a tube which takes the torque, and all wheels are of the Sankey-detachable steel type, shod with 700 x 80 mm. tyres. Both brakes are internal expanding, and lie side by side in drums mounted on the rear wheels. The whole design follows the latest car practice, and the differential and driving shafts may be removed for inspection without even jacking up the wheels. A V-shaped radiator is mounted in front of the engine.

Magneto spring drive and oil filler on White and Poppe engine.

# QUESTIONS and REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Cracked Cylinder.

**?** I have a 1911  $3\frac{1}{2}$  h.p. Singer (new March, 1912), and it has just developed a crack across the exhaust valve seating. I have been advised to run the machine as it is, as this is said to be a common occurrence. Would you advise me to do so or should I have it welded? There is no loss of compression, and the machine will do nearly sixty.—F.E.P.

You say there is no loss of compression at the present time, but if this develops you had better have the cylinder examined by a welding expert and see if it can be repaired.

## Forks and Belt.

**?** (1.) I have purchased a back wheel from one of your advertisers, but find that my back stays are not wide enough to take the new hub, the width of stays being 5in. and of hub 6in. Can I reasonably expect the forks to "spring" this amount, or am I likely to damage the frame? (2.) Is it wise to use a  $\frac{3}{4}$ in. belt on a  $\frac{3}{4}$ in. rim?—L.H.D.

(1.) The forks must not be sprung to the extent mentioned. You had better take your machine to a good engineering firm, and have the forks set out  $\frac{1}{2}$ in. on each side. (2.) The  $\frac{3}{4}$ in. belt would run on a  $\frac{3}{4}$ in. rim in some cases quite satisfactorily. Provided not more than a  $\frac{1}{8}$ in. stands above the rim when driving, the belt will not be damaged.

## Two-speed Single v. Single-speed Twin.

**?** At present I possess a 1911 5 h.p. free engine Rex motor cycle, and I am thinking of disposing of this and purchasing a new 1912 4 h.p. two-speed Rex. Do you think I would get as good results or better from the 4 h.p. two-speed machine as I get from my present 5 h.p. single-speed? This is a very hilly district, and about one-third of my mileage will be with sidecar. Of course it will be necessary to take the same degree of engine tune as granted in each case.—A.E.J.

On the top gear you could not hope to get the same results with a 4 h.p. as with a 5 h.p., but with the two-speed gear you should get better. On the whole, what we should recommend is a twin with two-speed gear, and if you can manage to get one of these we should strongly recommend you to do so.

## Glasgow to Leicester.

**?** I see from *The Motor Cycle* that you give information to motor cycling correspondents regarding the best and shortest routes between certain places.

I should be very glad if you could give me your advice for riding from Glasgow to Leicester, and also from Glasgow to Stamford, for the middle of December. I ride a four-cylinder F.N. machine (1910 model), and want to avoid hills and towns as much as possible.—M.G.C.

Your best route would be as follows: Glasgow, Lanark, Peebles, Galashiels, Melrose, Coldstream, Wooler, Alnwick, Morpeth, Newcastle, Durham, Darlington, Northallerton, Boroughbridge, Wetherby, Aberford, Ferrybridge, Doncaster, Worksop, Mansfield, Nottingham, Loughborough to Leicester. To get to Stamford, instead of branching off at Doncaster go straight down the Great North Road, through Retford, Tuxford, Newark, Grantham, to Stamford. We have purposely given you a roundabout way, as you have asked us to avoid hills. The most direct way from Glasgow

to Leicester is to go through Hamilton, Beattock, Lockerbie, Longtown, Brampston, Alston, Middleton-in-Teesdale, Barnard Castle, Scotch Corner to Boroughbridge, and then as we have previously mentioned.

## Long and Short Stroke Engines.

**?** I should be glad of your opinion of the above engines, and also your answer to the following questions: (1.) Would you consider the  $3\frac{1}{2}$  h.p. long stroke 79×100 mm. suitable for sidecar? Is it not more inclined to knock than the 85×88 type? (2.) Would you say 79×100 gave more power than 85×88? It is supposed to be more flexible, I believe. Would you say that is correct? (3.) Is the Norton a clean engine? How about compression?—J.K.

(1.) Yes, the engine is suitable for sidecar work. It does not appear to knock more than an 85×88 engine. (2.) It is quite as powerful and flexible as an engine of 85×88 mm. (3.) The engine certainly keeps clean. The compression is moderate.

AN IMPRESSION OF THE MORGAN RUNABOUT AT SPEED.

H. F. S. Morgan travelling at a mile a minute speed during his hour record of 59 miles 1,123 yards.

Bentley (Hants.) to Blackheath.

?

I shall be very much obliged if you will kindly tell me the best route from Bentley, Hants., to Blackheath, avoiding traffic as far as possible.—D.H.C.

You, best route would be as follows: Bentley, Farnham, Hog's Back, Guildford, Shalford, Shere, Gomshall, Dorking, Reigate, Redhill, Westerham, up Westerham Hill, then through Hayes, Bromley, and thence to Blackheath. If you do not care to ascend Westerham Hill, you had better continue your journey a little further on till you reach Riverhead, north of Sevenoaks, where turn left.

#### Lamps and Burners.

?

I would be grateful for your valuable opinion on the following questions: (1.) Can a 1913 T.T. roadster Triumph safely carry a 6½ in. Rushmore headlight weighing, without bracket, 6½ lbs.? I notice a big F.R.S. set for the head of a machine weighs: Lamp 4½ lbs., generator 2 lbs., bracket 1½ lbs., so presumably, when in actual work, this strain would amount to approximately 9½ lbs. to 10 lbs. (2.) Would you recommend my fixing a Rushmore to the handle-bar stem in head or the girders of the front fork? In the latter position, would vibration be excessive? (3.) I have a 14 litre burner in my F.R.S. Does that mean I consume 14 litres of gas per hour? Is 14 litres an average burner? (4.) How many litres go to a cubic foot? (5.) I have a Sentinel generator which I find admirable. It is guaranteed to burn for five hours; probably it will do about four hours. Does that mean that a charge of carbide and water produces from 56 litres upwards of gas? (6.) A Rushmore 6½ in. lamp carries a 14 litre burner. Could I, consequently, burn this lamp as long as the F.R.S.? (7.) Does a consumption of 14 litres demand a given pressure being maintained? (8.) Does the area of the lamp affect the pressure demanded?—R.B.R.

(1.) We should say that the Rushmore lamp could be easily carried on this machine on one of the special brackets

supplied by the lamp makers. (2.) The most satisfactory fixing would be on the handle-bar stem, or round the handle-bar. The girder of the fork would be most unsuitable, as the lamp would be constantly changing its angle. (3.) A 14 litre burner means that it would consume 14 litres of gas per hour. This is the average size burner. (4.) There are just over 28 litres in a cubic foot. (5.) Assuming a 14 litre burner: 56 litres downwards as burner capacity represents maximum at normal pressure. (6.) Yes, you could burn the Rushmore as long as the other lamp mentioned. (7.) Naturally, it means that the gas is given off comfortably in the generator, and the flame must not be flaring. (8.) We do not think so.

#### Liabilities of Dog Owners.

?

Would you please inform me if I have any chance of obtaining compensation in the following case: In passing along a country road in the middle of the day with a motor cycle and sidecar at a speed of about 10 to 12 m.p.h., as to which I have two independent witnesses to prove, a dog rushes out of a gate in a field, striking the wheel of sidecar and breaking axle, throwing out passenger. The person with the dog was standing on the opposite side of the road, about thirty yards from gate from which the dog came, the gate being on the left-hand side of the road. Also has the owner of the dog any claim against me for injury to dog (if any)?—F.C.

Our legal adviser writes as follows: "Your correspondent has no claim against the owner of the dog unless he can show that the dog was of a vicious nature, and that it was customary for it to rush at motor cycles, and that the owner knew of its propensity. This does not seem to be the case, as the dog was evidently running across to its master, and had no evil intentions towards your correspondent or his cycle. On the other hand, the owner of the dog would have no claim against your correspondent, if, as would appear to be the case, he was not negligent in the way he was riding his machine."

#### Misfiring at Slow Speeds.

?

I have trouble with the starting of my 1912 2½ h.p. Humber, it only firing on the back cylinder until I get the engine working at about 15 m.p.h. This I have to do with the aid of the pedals, which is unpleasant. When I have got over this difficulty the machine is all one could desire. I should be very glad if you could give me a solution to this little difficulty. I am using a No. 28 jet and have had both cylinders down, but cannot find any defects in either, both having about the same compression.—A.H.T.

In the ordinary way we should imagine it was due to a defective or sooted plug in the front cylinder. Try a change. Also, the trouble is possibly due to the carbon brush conducting the high tension current to one of the cylinders sticking in its guide, or may be to the inlet valve sticking. Remove both magneto carbon brushes and wash them in petrol, also follow closely the working of the contact breaker, making sure that the platinum points are clean and flat.

#### Electric Lamps.

?

I am thinking of fitting my head light up for electricity, as I am tired of the constant trouble caused by acetylene. I propose using a 40 amp. accumulator, and a four or seven candle power Osram bulb. (1.) Will a metallic filament bulb withstand the vibration of a motor cycle? If not, can you advise me what sort of bulb to use to get the best light? (2.) Will the accumulator stand the vibration if placed somewhere in the region of the pannier bags on the carrier?—J.H.G.

(1.) A metallic filament bulb will withstand the vibration, but it is advisable not to switch on the current while the machine is on the move. (2.) The accumulator, if a good one, will stand the vibration; we have had one in use for nearly two years, and for short distances every evening much prefer it to acetylene. The accumulator is charged about once every month or five weeks (it is a 20 amp. hour, and the lamp consumes .6 amps).

#### READER'S REPLY.

##### Belt or Clutch Slip.

An excellent tip for distinguishing belt slip from clutch slip is to run the machine with the belt or clutch slipping for a hundred yards or so and then put the finger on the clutch. If clutch is hot or very warm the fault is there. The same test may be made with belt pulley. —OSCAR C. FRIED, Rekawinkel, Austria.

#### EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed to The Editor.

"Mac" (Crewe). Binks and Senspray carburettors on 3½ h.p. Premier.

"T.H." (Sydney, N.S.W.) Two and three-speed counter-shaft gears on 1912 Rover.

"W.F.A." (Godalming).—8 h.p. J.A.P. engine (1912) fitted with Lukin, S.P., and Senspray automatic carburetters, as to petrol consumption, speed, etc.

three-quarter front view of the Invicta. This machine was described in our issue of November 14th. It was used outside Olympia last week for trial trips and evoked great admiration.

# MOTOR Ladies

by Mrs McCooke

# CYCLES at Olympia

THERE is nothing in the motor cycling world so much looked forward to now-a-days as the Olympia Show. It is really one of the most wonderful sights imaginable to see the thousands of people arriving each evening by tube, car, and 'bus. The jollity and good feeling prevalent in the Hall make one feel that motor cycling is certainly one of the great joys of life.

This year more than ever the Show seems to have been a social event, and a very noticeable feature was the number of married couples of all ages who might have been seen walking round, criticising and testing the comfort of the different types of motor vehicles.

It has long been maintained that the success of motor cycling depends upon the participation of both sexes in the movement. This has been amply demonstrated by the enormous boom in sidecars and open frame machines during the present year. Never before in the history of the sport have so many ladies been seen on the open road, either as the occupants of sidecars or as riders of solo machines; in fact, they have rivalled their more favoured sisters who have attained to the luxury of the motor car.

## An Increasing Market.

I am told that one firm alone have turned out 300 ladies' machines this year, and hope to make 400 during 1913. Another firm have already booked orders for fifty. At present the fringe of the movement has only just been touched: another year or two will probably see great developments. The rising generation are enthusiasts on solo riding, leaving their parents to take up the sidecars and cyclecars.

Manufacturers now have so many models to show that it must have been a matter of difficulty to stage each one to the best advantage. In consequence, some of the open frame models were placed on high, rather inaccessible stands, which made it very difficult to examine some of the interesting points critically.

Ladies' machines have been greatly improved, and are much more interesting than those of any previous year. The designers of the several models are to be congratulated on the progress made. Frames have been re-designed and strengthened, mudguarding has received special attention (although in one or two cases there is still room for some improvement), starting devices have been fitted, and, lastly, makers have realised that ladies do not wish to stop every few miles to buy petrol, and have fitted larger tanks. This is in itself a boon.

The machines exhibited at Olympia place themselves naturally into three classes:

1. Single-cylinder machines.
2. Twin-cylinder machines.
3. Sidecar machines, which may be singles or twins.

The first-named claims the greatest number of models, the power ranging from 2 to 3½ h.p.

The 2 h.p. Motosacoche is almost identically the same as was exhibited last year, and for its purpose has no rival. It is light, very clean, and easily handled, and is, in fact, ideal for shopping and visiting.

## Single-cylinder Models.

The Hobart has been greatly improved, and looks much more workmanlike than before. The engine is now fitted vertically instead of inclined, and is slightly larger. All the moving parts are well enclosed by shields. A Sturmey-Archer three-speed gear is fitted.

The open frame Singer is a very smart-looking little mount, and simplicity is its keynote. It is fitted with the renowned 2½ h.p. Singer engine, and tucked away in the crank case is their excellent two-speed gear. The starting arrangement is good, and the clutch device is a marvellous piece of mechanism. This machine has a high turn of speed, and is altogether a most efficient and comfortable little mount. Some small improvements in the mudguarding would make it ideal for long or short distances.

A very interesting and handy-looking machine is the Veloce, which made its *début* at the Show. This model also is fitted with a 2½ h.p. engine, and has a two-speed gear in the crank case, as well as a free-engine arrangement and forced lubrication. Its method of oiling is quite unique and gives no trouble. An indicator rod passing up the side of the petrol tank keeps the rider informed as to the proper flow of oil. It will be interesting to know how this little machine performs on the road. We welcome it as a very promising looking mount, and congratulate the makers on their enterprise.

## A New Comer.

Another newcomer to the ranks is the Ivy-Precision. This name is so well-known in the motor cycle world that great things will be expected. Although this is only the second lady's machine made by the firm, the excellent design and finish are worthy of great praise. It is fitted with a 3½ h.p. engine, and a Sturmey-Archer three-speed gear.

A very noticeable feature is the kick starter, which is fitted on the right-hand side of the machine and slightly in front of the ordinary pedal position. To start the engine only a slight push forward is required. This appears more natural than a back kick.

The engine and carburetter are enclosed by easily removable shields clipped to the down tubes.

Although a good solo machine the Ivy is specially built for sidecar work. The frame, with its double down tubes, is remarkably strong, and extra large oil and petrol tanks have been fitted.

**Ladies' Motor Cycles at Olympia.—**

Another machine of this type is the  $3\frac{1}{2}$  h.p. Brough, which is absolutely bristling with good points. The frame is strengthened by means of duplex down tubes, which are exceedingly neat and graceful as well as strong. Of special note are the extra air-cooling arrangement, the easily detached front wheel, and the efficient guarding which all point to the practical mind of the designer. It is fitted with the Armstrong three-speed gear and handle starting, and would be an ideal sidecar machine for a lady.

An open frame machine on rather novel lines is provided in the Swan, which may be used by either sex. Generally speaking, however, it is not altogether suitable for a lady, the saddle position being rather high, and the saddle itself, although excellently sprung, not giving a feeling of absolute safety. The mud-guarding on both wheels, as well as under the engine, is very satisfactory: in fact, it ought to be one of the cleanest machines on the market.

**Twin-cylinder Types.**

For those ladies who prefer twin-cylinder machines four firms were showing models.

The  $2\frac{3}{4}$  h.p. Douglas holds pride of place in regard to popularity, and its suitability has been fully demon-

Valve side of the lady's model  $3\frac{1}{2}$  h.p. Brough exhibited at the Show.

strated in open competitions during the past season. The chief alteration for 1913 is in the mudguarding, which has been extended outwards on each side of the front wheel.

The Enfield Cycle Co. were showing a 3 h.p. twin in place of last year's single-cylinder. This machine possessed many smart features, notably the unique oiling arrangement which is operated mechanically from the engine. The shields are most cunningly fitted, being hinged from the top tubes and fastened down by means of twist clips. The gear levers and brake pedals are not mounted on the footrests, so that should the machine fall no damage to the former would result. The overhead inlet valves and plug terminals are fitted with very efficient protectors.

Two 6 h.p. models of ladies' machines were shown by the Rex Motor Manufacturing Co., one being attached to a sidecar. For this work it ought to be one of the best, but its use as a solo mount for a lady is questionable on account of its weight and starting arrangements. It would be safe to say these two machines had the most serviceable mudguards of any ladies' machine in the Show.

The remaining open frame machine goes into a class of its own. It is the  $3\frac{3}{4}$  h.p. Scott—a machine

scarcely to be recommended to a beginner, but eminently suitable for a lady with some little experience of the art of motor cycling. The riding position of this machine is perhaps the safest and most comfortable of any open frame machine on the market. The frame is remarkably low, and every part is well protected, including the driver.

**The Position of the Speed Gears.**

With one exception all models were fitted with two or three-speed gears and free engines. The hub gears seem to be the most popular, although perhaps the counter-shaft geared machine is the better balanced and the more comfortable to ride.

One of the essential points of a lady's machine is the simplicity and ease of starting. On the whole the Show machines had been well attended to in this respect, particularly the Singer and the Ivy-Precision.

The mudguarding is far in advance of last year (the past summer may account for this), but we lady riders are taking some little credit to ourselves for indirectly helping on the movement. A clean machine is a *sine qua non* for a lady. One point which seems to escape notice by makers is that just behind the saddle-pillar on both sides the mud thrown from the rear wheel reaches the rider's coat.

**Gear and Brake Levers.**

Owing to the general design of an open frame machine it seems to be the practice to mount the brake lever and speed-operating pedal on the footrests. After the slightest fall or mishap the footrests would probably be bent, and the back brake and gear mechanism would be rendered inoperative. Several of the Show models were mounted in this way.

In saddles, again, a great improvement was noticeable. The majority of the machines were fitted with very comfortable saddles, the XL-All seeming to be the favourite.

The greatest stumbling block to the popularity of motor cycling for ladies is the almost prohibitive price of motor bicycles, especially those with open frames. This is the outcry of all the girl cyclists one meets, and one cannot at the moment see any signs of a reduction.

I believe one Show model may be marketed at £45, and, if so, will be excellent value for the money, as it is fitted with speed gear and free engine.

**Dress and Equipment.**

The disappointing part of the Show was in the clothing. Ladies were practically uncatered for.

The Service Co. were showing a cape and detachable hood which would be of great service to sidecarists, but certainly not a thing of beauty.

The Express Rubber Co. had some rather nice silkproof coats in various colours, but it was difficult to get any information about them as to price, as they only supply the trade.

Messrs. Dunhill were showing some macintosh hoods.

These notes would be very incomplete without some reference to the wonderful little Auto-wheel. The simple method of attachment to any ordinary bicycle, and the whole idea of the thing being so self-evident, seemed to appeal very strongly to all cyclists, and we may expect to see several on the road in the near future. Locomotion by this means is a pleasure in store.

# Avon Motor Cycle Tyres

Suitable for all climates.

## TRICAR.

24in., 26in., and 28in. diams.  
24in. ... 40/-  
26in. ... 42/6  
24in. to fit 24in. rim ... 45/-  
3in. to fit 24in. rim ... 50/-

## CYCLECAR.

Covers in this Pattern, 650x65, with voiturette beads ... 50/-

## SUNSTONE.

26in. only.  
24in. section, 45/-  
24in. ... 50/-  
Made by our new Electro-Hydraulic process, which ensures uniformity in casing and tread, and produces a superb finish.

## BICAR.

24in., 26in., and 28in. diams.  
24in. ... 32/6  
26in. to fit 24in. rim ... 34/3  
24in. rim ... 36/9  
3in. to fit 24in. rim ... 41/9  
Suitable for 3 1/2 in. to 5-6 h.p. machine.

## STONEHENGE.

24in., 26in., and 28in. diams.  
24in. ... 25/-  
26in. ... 26/9  
28in. ... 2 / 6  
24in. to fit 24in. rim ... 31/-  
Extra strong casing.

## TUBES (fitted with Motor Cycle Valves).

24in., 26in., and 28in. diameters.

AVON Quality (Red).		NOVA Quality (Red).	
1 1/2 in.	8/-	1 1/2 in.	6/9
2 in.	8/9	2 in.	7/6
2 1/2 in.	9/6	2 1/2 in.	8/3
2 1/2 in.	10/3	2 1/2 in.	9/-

All motorcycle tubes can be fitted with the Avon Dome Ends at 2/- each extra.

## DRUID.

24in., 26in., and 28in. diams.  
24in. ... 21/-  
26in. ... 22/9  
Also 26in. x 1 1/2 in. ... 19/3  
Suitable for 2 1/2 to 3 1/2 h.p. and Sidecar wheels.

## Lightweight A.

24in., 26in., and 28in. diams.  
24ins. ... 17/9  
26in. ... 19/-  
Also 26in. x 1 1/2 in. ... 16/9  
As a cheap cover this cannot be beaten.

## AVON DOME ENDS.

Easily fitted. Easily detached.  
Registered Nos. 572, 420.

## Lightweight B.

24in., 26in., and 28in. diams.  
24in. ... 15/6  
26in. ... 16/3  
Also 26in. x 1 1/2 in. ... 14/9  
A special grade at a special price.

## COMBINATION.

## AT THE SHOW.

A Faddist among the Motor Bicycles

By B. H. DAVIES.

**T**HERE was a time when I carefully shepherded any youthful relative who went up to a motor cycle show with a doting parent's cheque burning his pocket. It was so easy to invest £50 in a manner likely to impale the tyro on the horns of a dilemma represented by disillusion or bankruptcy. But nowadays I pat young hopeful on the back, give him my blessing, and bid him call round in a week and tell me what he's bought; for I know he is sure to have a jolly season whatever bicycle takes his fancy. All machines are roadworthy. One may be more likely to damage a standard speedometer; one may require new engine bushes a month sooner than another; one may have softish valves, rings, and cylinders; but practically the entire exhibit may be compared to Charley's Aunt, Tennyson's brook, or any other symbol of perpetual motion. The greenest duffer can scarcely find a "dud jigger" in the entire exhibition. (P.S.—This judgment does not necessarily apply to all the cyclecars.)

An aged and *blasé* scorcher like myself is apt to visit a show in unduly critical mood; but criticism for once must have reference to what was not there, and ought to have been there, rather than to the actual exhibits staged. I wandered from stand to stand, and found on each a good engine, strong frame, sound ignition, improved carburation, excellent transmission, reliable brakes, etc., etc. Details show great ingenuity and refinement. The comparative absence of originality and genuine innovation was a thing to weep over; but the public are to blame for that. They will not buy unconventional articles; the manufacture of motor cycles is a trade, not a philanthropy;

capital is limited, and dividends are desirable. Hence a firm which comes to the Show knowing that double its 1913 output is easily saleable has small inducement to consider revolutionary possibilities.

### Straws and the Wind.

Things are moving fast in the transmission world. Only yesterday a few heretical engineers were coquetting timidly with variable gears—mostly heavy two-speed hubs or two-speed counter-shaft gears, seldom

New 3½ h.p. Day-Leeds, on which combined belt and chain drive has been adopted.

free from serious technical flaws. To-day a cheap, light, reliable three-speed gear is listed by practically every exhibitor; and quite evidently within a short time the three-speed gear will "advance quick march" from the hub to the counter-shaft, a change which will enforce two-step drives on all roadsters. The battle royal between belt and chain will then have reached its Chatalja, and we shall see whether

- (a) enclosed chains,
- (b) enclosed chain and naked belt,
- (c) enclosed shaft and naked belt, or
- (d) enclosed gear and naked belt

is likely to be the victor. Other combinations are, of course, possible. I doubt myself whether the fore chain will be permanent, since other rigid substitutes offer a prospect of neater aspect and less adjustment. I doubt also whether the secondary belt will ever be ousted, for it touches the zenith of simplicity and cheapness, it is satisfactory in use, and it leaves a truly accessible back wheel. I think that the 5 h.p. Hazlewood, with the counter-shaft three-speed hub, may prove to be as true a prophet as any. I cannot regard hub gears as final, yet, *per contra*, the three-speed hubs are too good to die; they are cheap, light, compact, efficient, and reliable. Nobody has yet evolved a counter-shaft three-speed half so attractive as a migrated hub would be.

A N.S.U. refinement. The pedal kick-starter added for 1913.

At the Show.—

2 1/2 h.p. Junior T.T. Calcott. The cylinder is offset.

**Wear of Bearings and Lubrication.**

We have heard a lot about short-lived engine bearings lately, and no wonder. Bearing pressures must have increased tremendously since 1903, the size of the bearings has rather been decreased than otherwise, lubrication has remained stationary for ten years, and thousands of duffers have entered a sport which was once the monopoly of mechanics. I did not realise what a makeshift splash lubrication is, whether operated by a hand pump or a pump and drip, until I heard the car owners commenting on the cyclecar lubrication systems. The motor cycle industry stands where the push-bicycle industry was when everybody with the necessary dibs bought a new pedal cycle roadster every spring. So long as this habit continues, makeshift lubrication and short-lived bearings will be tolerated. But to-day I ride a push-bicycle, I bought eight years ago; and a similar era is ahead in the motor cycling world. Consequently one may prophesy with confidence that such oiling systems as are to be seen on the 3 h.p. Enfield, the 3 1/2 h.p. W.D., the Veloce, and a few other machines show which way the wind must blow. They are vanes of progress.

**Carburetters.**

The automatic and semi-automatic carburetters have swiftly entrenched themselves. Derided by croaking experts for years past, they have none the less got their teeth into the general public. I have tried most of them, and find them a tolerable compromise. You may sacrifice a few "revs." (with some examples),

you may sop up more petrol per century, you may find them tricky to tune to the finest limit; but you get an excellent average product of gas, and you get it without tap-twiddling. Cyclecars will aid their evolution vastly; the man who has a clutch and three gears does not want to be bothered by an air lever. But the problem is easier with a multi-cylinder engine.

**Engines.**

I found nothing to encourage a general departure from the side-by-side m.o.v. Valves in the cylinder head may give a shade more speed, but they do not ease the job of cleaning the cylinder or attending to the valves themselves. When we get oiling systems which lengthen out the periods between decarbonisations, overhead valves will have a better chance to show their merits. At present I am sure 95% of the buyers prefer side-by-side valves. The decompressor has come too late. It is an admirable fitment on a T.T. single gear, or to ease the shove of a kick starter; but a solo rider with a variable gear will not value it excessively, for the engine is so easy to start without it. I particularly liked the James notion of operating the magneto and decompressor by means of a standard two-lever carburetter control. Four years ago I would gladly have paid £5 for a good decompressor; this year I had one on my three-

7 h.p. twin-cylinder Ariel, fitted with two-speed counter-shaft gear, chain drive, and handle starter.

speeder, and I never used it except for a wheel-pull engine start. Decompressors will be convenient, but scarcely as necessary as once they were.

**Mudguards.**

There will be much less mud-throwing next year, but it is easy to exaggerate the value of the new wheel-sheaths and broad footplates. Machines will still need cleaning from stem to stern after a day's mud-plugging, though the pile of scrapings should assume more modest dimensions. For consider, mud generally means rain, and even when it doesn't, no guards can intercept all the flying clogs. After a rough day on the road, the machine will be lightly filmed with mire (instead of heavily), oil will still exude with considerable freedom from most engines, rust will still hide amidst all the tiny bolted-on fittings. I have attacked the myriad little fancy chinks and cran- nies; the practical motor cyclist has no hopes of a machine which will never need cleaning, but he would give the world for a machine which is easy to clean. It does not matter how much you encase the wheels of a 30 m.p.h. two-wheeler, you cannot keep liquid mud off it. But a little thought would render the machine far, far easier to cleanse.

Valve side of a new 2 1/2 h.p. mount made by Components, Ltd.

At the Show.—

o.n.g. single-cylinder Rudge-multi sidecar combination. The bore and stroke of the engine are 85 x 132 mm. Note the cut away tank for the overhead inlet valve and tappet.

### Clean Design.

I notice how wisely car designers tackle this point, so grossly neglected by motor cycle engineers. A typical modern car engine resembles nothing more than an up-ended suit case. The under-works of the chassis have smooth cylindrical or spherical surfaces, devoid of excrescences. No small plated parts are to be found in the subterranean, mud-catching regions. The chassis is often a symphony in cubes and spheres, as smooth as a maiden's cheek. Now the Stellar machine with its unit construction gives a blurred idea of a distinct possibility. My prophetic eye peers ahead, and dimly discerns a machine which resembles these cars. All the details of its forks and brakework are blacked. It has disc wheels. The magneto is self-advancing. The automatic carburetter is controlled by a twisting grip and internal wire. The shape of the carburetter, magneto, gear box, and engine are not designed to grip their innards com-

pactly, but to afford smooth, hosiabable surfaces, cubical or spherical. The valves and tappets are encased, so are the sparking plugs and their cables. If water-cooled, the engine is merely a large oblong box to an exterior view; if air-cooled, its radiators are detachable, and are the only part with complex outlines. Imagine a four-cylinder *mono-bloc* car power unit seen through the wrong end of a field-glass and mounted in a motor cycle frame and you get my meaning. The transmission is similarly encased. The very toolbags consist of padded metal boxes. There is not a chink or a cranny from stem to stern, and an ostler can be left to hose the outfit down at his leisure. If one of our leading makers produced such a machine for the 1913 Show, without sacrificing any of his present model's merits, what a colossal vogue it would have. Wider mudguards, the trade's present solution, are only tiding over the difficulty. One of the machines which had about the best mudguards in the Show would take three hours to clean after a ride from London to Coventry on a typical November day. I notice that the *débutant* firms, like the Sunbeam and Lea Francis people, show a keen perception of this crying need, though they do not go much farther than the others towards a solution. Mere black enamel and chain cases cannot solve it. We want square engines, spherical gear boxes, cylindrical carburetters, and a scathing elision of all "twiddly bits." Otherwise we shall not rope in the fastidious doctor, the retired major, *et hoc genus omne*; nor yet any damsels of Victorian tendencies.

When discussion simmered down to the choice of a machine for next year's riding, I found the selection seemed to depend principally on a man's political opinions. We all had jolly good seasons on our 1912 mounts, and the 1913 editions of the same makers were obviously about 10% better. So such of us as were Conservatives and disliked change gave a repeat order, while those of us who are Radicals and prefer novelty transferred our patronage to the chief rivals of the firm whose mount we bestrode last summer; while the Socialists, well, I suppose that, pending the free provision of State motor cycles, they pressed for the largest obtainable discounts.

The oil sump and filler cap pump on the Wilkinson-Wooler horizontal two-stroke machine.

New spring fork with double spiral springs fitted to Ivy-Precision models.

Kerry-Abingdon combined belt case and rear number plate, also showing spring catch to secure stand.

# Our Artist's Impressions of the Show.

Views of the new Morris-Oxford light car, fitted with the four-cylinder 60 x 90 mm. White & Poppe engine, described on page 1450. The frame is by Rubery Owen and Co., and the back axle by E. G. Wrigley. The designer, Mr. W. R. M. Morris, is seen at the wheel in one illustration. He will be remembered by old readers as the designer of the Morris motor bicycle of 1904.

## The Number of Motor Cycles at Olympia.

It is interesting to note how motor cycles were represented at the recent Olympia Show. We give below a few figures compiled by Harry Hewitt Griffin, F.S.S., M.J.I.

### SOLO MOTOR BICYCLES.

#### Transmission :

All belt	...	...	...	...	411.
All chain	...	...	...	...	162
Compound	...	...	...	...	51
Gears	...	...	...	...	13

#### TOTALS.

Sidecars ...	...	...	...	...	144
Solo mounts	...	...	...	...	493
					637

There were no sidecars and bicycles permanently forming part of each other.

### RUNABOUTS.

Of light complete motor cars (now called cycle cars) used for passenger—solo, double, or multi—service, there were:

Three-wheeled	...	...	...	...	8
Four-wheeled	...	...	...	...	54
					62

Of the latter, 9 were of the tandem-seated type. Including cars for goods delivery and chassis there were 110.

## THE NOISE OF MOTOR CYCLES.

### Edict of the Local Government Board.

On March 31st, 1913, the new Local Government Board order concerning the use of cut-outs on motor cycles comes into force. It will be gathered that cut-outs fitted to the exhaust pipe will soon become illegal; the exhaust gases must first pass through an expansion chamber.

It is pleasing to be able to state that the open exhaust fiends will soon disappear from our roads.

For historical purposes we give below the reading of the Local Government Board Order:

"(7) He shall not use any cut-out, fitting, or other apparatus or device, which will allow the exhaust gases from the engine of the motor car to escape into the atmosphere without first passing through a silencer, expansion chamber, or other contrivance, suitable and sufficient for reducing as far as may reasonably be practicable the noise which would otherwise be caused by the escape of the said gases."

Front portion of the new Perry runabout, showing twin engine and gear box unit.

## SHOW MACHINES.

### Clyde.

The 8 h.p. Clyde sidcar machine was a late arrival on the stand of Messrs. Montgomery and Co. Its motive power is an 8 h.p. J.A.P. engine, 85 x 85 mm., 664 cnb. cm., driving by chains through a G. and H. counter-shaft two-speed gear. It will be noticed that a loop frame is employed, a feature which has been standard on Clyde machines during the last ten years. The frame also gives a very low-riding position. The lubrication is by crank case suction through an adjustable drip feed, while as a stand-by an ordinary oil pump is also supplied. The back wheel is fitted with Hoffmann cage type ball bearings, which render the wheel quickly detachable. The silencer is well designed, consisting of an expansion chamber of ample dimensions, which possesses a long exit pipe. The machine is well thought out, and shows the result of the long experience gained by its manufacturer, Mr. G. H. Wait, of Leicester.

### The Media Gear.

An infinitely variable gear (within limits) of very ingenious and quite practical design is employed in the Media cycle car chassis, shown by Mead and Deakin. The principle upon which it works is one of the oldest in the history of mechanics, viz., friction, but the application discloses several quite novel and interesting points, which are set out in the following description and the subjoined sketch. The latter does not portray all the details of the gear attachment—for instance, the near side frame tube is left out for the sake of clearness—but illustrates the essentials of the device.

An ingenious cone friction transmission.

The engine-shaft is continued rearwards (the crankshaft being longitudinal) to support a conical body of very much the same shape as an ordinary flower pot. This body, which is the driving member of the mechanism, is shod with a special kind of fibrous material. A

second but much larger fern-pot-shaped body, in this case the shell being of aluminium, is similarly lined, and is carried by the front end of the propeller-shaft. The journal bearing supporting the latter is very long, and is

8 h.p. twin-cylinder Clyde-Jap fitted with G. & H. two-speed gear, and chain drive.

swung upon two trunnions, which in turn are supported in a metal housing forming a tunnel over the shaft. This housing is pivoted upon a couple of cranks, and is extended rearwards to provide an anchorage for a couple of stout tension springs. The effect of these is, as will be at once seen from the sketch, to press the inner surface of the large cone upon the outer surface of the small one. The cranks supporting the journal are attached to a pivoted rod, which carries what may be described as the change speed lever.

The gear, as illustrated, is giving a low gear ratio of slightly more than two to one. If the gear lever be pushed to the left, the bottom pivots of the cranks, and the housing to which they are attached, will move to the right, and the large cone will move also in this direction, so that the small cone will be frictionally driving an outer cone of smaller diameter than before. As a consequence the gear is raised. By pushing the gear lever to the extreme left the small cone beds down into the base of the large one and forms practically a cone clutch, thus giving a direct drive and entirely cutting the frictional transmission out of action. It will be understood that the slope of the cones and the length of the cranks are so arranged that the larger cone moves in a direction parallel to the upper surface of the small cone. This means, in effect, that the contact between the two cones is always represented by a line of considerable length, so that the tendency for the cones to slip is reduced to a minimum. This is, of course, one of the great advantages of the gear.

### Free Engine.

Referring again to the sketch: if the gear lever be moved to the right, the large cone is taken out of engagement with the smaller one, being both lifted from it and slid away from it; and this action provides a clutch effect giving a perfectly free engine position.

The behaviour of the Media gear on the road will undoubtedly be watched

with great interest, as it certainly appears to have several very desirable features—not the least of which is simplicity. It need, perhaps, hardly be pointed out that the propeller-shaft is furnished with a universal joint at its differential end in order to take up the change in angularity of the shaft, though this, owing to the length of the latter, is comparatively small. It will be observed, incidentally, that with this form of friction gear, no reverse is possible except by extraneous mechanism.

### A Spring Handle-bar.

We referred briefly to the Sphinx spring handle-bar in our last issue, and now illustrate this useful device. The chief disadvantage with some makes of spring handle-bars is that they are not sufficiently rigid laterally. The Sphinx handle-bar, instead of having the springing arrangement in the centre near to the stem, is provided with joints on each side, the two sprung portions of the bar being joined by a cross tube. The springs are adjustable, and the lateral

Sphinx spring handle-bar.

bearings are easily tightened. The total range of action is about six inches, and there is no difficulty in mounting, owing to the bars being depressed, as they depress to a stop and are thus rigid. Provided there is the same lateral rigidity as with an ordinary bar there is no question of doubt that the spring handle-bar is very effective in absorbing vibration. The standard size of stem is 7/8 in. It is made by the Sphinx Manufacturing Co.

### Popularity of Dunlops.

A census of the tyres and belts at Olympia showed that there were 45% of Dunlop belts and a large number of tyres.

New Bosch helical spring and stop controlling the advance and retard of the contact breaker.

## CYCLE CARS.

**Ace.**

The 8 h.p. Ace, made by the Salmon Motor Co., Ltd., Burton-on-Trent, was used for trial runs outside the Show last week. It is a vehicle which comes easily under the cubical capacity and weight limit of a cycle car. The frame is of pressed steel, suspended on quarter-elliptical springs at the rear and semi-elliptical in the front. The engine, which develops 8 h.p., has the cylinders, which are 56 x 76 mm., cast *en bloc*, while the valves are enclosed.

The circulation is arranged on the thermo-siphon system. The carburettor is a Binks. The camshaft is driven by skew gearing, which also drives the magneto. The latter is mounted transversely in the chassis, as is the oil pump, which delivers the oil under pressure to jets which squirt it on to the big ends on their downward path, thus preventing any excess of oil being carried upwards. The oil is also delivered into wells over the main bearings.

The clutch is of simple design and consists of two discs, one of steel attached to the main shaft and the other faced with Ferodo attached to the propeller-shaft, the two being kept in engagement by means of adjustable spiral springs. The gear box, which gives two speeds and reverse, contains a bevel-driven cross shaft, whence the drive is conveyed to the rear axle by means of a chain. A slightly more expensive model may be

purchased which has three speeds and worm drive. In the lower priced model the rear wheel brakes are of the internal expanding type, while the foot brake, which is of the shoe pattern, is applied to a drum on the cross shaft. The steering is of the geared type, and the control of the engine is by accelerator pedal. It appeared to be excellent value for £100.

Four-cylinder Ace power plant.

**Eagle.**

We have several times mentioned in these pages that the vehicle known as the cycle car is by no means a new introduction; in fact, it is as old as the motor movement itself. As a proof of our contention there arrived on Monday of last week, at Olympia, two Eagle runabouts which came by road from Manchester. One of these was an original 6 h.p. Eagle made ten years ago and bought for a mere song by the present company, tuned up, and fitted with a new body. This was fitted with a De Dion engine and the old expanding clutch gear and silent chain drive which was exhibited at the earlier

exhibitions at the Crystal Palace. The new type of 6 h.p. will be fitted with a water-cooled engine and the Ralph Jackson epicyclic gear, giving three speeds forward, or two speeds forward and reverse, according to the customer's requirements. The Eagle is, of course, a three-wheeler.

**Tinycar.**

The Tinycar, made by Messrs. Nanson, Barker and Co., Asholt, Yorkshire, and which was only briefly referred to in our last issue, has a suitably stayed tubular frame, in which the engine is set longitudinally in front. The drive is by propeller-shaft to the three-speed gear box containing a cross shaft driven by bevel gearing, through which the drive is finally transmitted to the rear axle by single chain. A differentially geared axle is fitted. The clutch is of the leather-to-metal type and has a heavy rim giving an additional flywheel effect. The engine is the well-known 8 h.p. J.A.P., the carburettor is the Brown and Barlow, and the ignition is by Bosch high-tension magneto. The top gear ratio is 4 to 1. The differential previously referred to is provided with spur pinions, and the axle is supported on ball bearings. The lines on which this vehicle is constructed are quite sound. The following dimensions are interesting: Wheelbase 8ft. 6in., wheel track 3ft. 8in., over-all length 11ft., and over-all width 4ft. 4in. The chassis is suspended on semi-elliptical springs front and rear.

Dash of the Day-Leeds cycle car showing pedal controls and lubricators.

**New Hudson.**

The New Hudson cycle car was possibly more like a motor cycle than any other passenger vehicle in the Show. Mr. A. E. Wilson, the managing director of the firm, told us that he had no intention of enlarging the vehicle until it reached the dimensions and adjuncts of a small motor car. He said they intended to keep it as originally designed and exhibited, *i.e.*, a lightweight passenger vehicle weighing little more than a heavyweight motor bicycle and sidecar, and with the same methods of transmission, etc. Delivery will not be possible for some months, but we are promised a trial of it as soon as the makers are prepared to deliver.

Broadside view of the Ace four-cylinder, two-speed, chain-driven cycle car

#### TIME TO LIGHT LAMPS.

Dec. 5th	...	...	4.50 p.m.
" 7th	...	...	4.50 p.m.
" 9th	...	...	4.49 p.m.
" 11th	...	...	4.49 p.m.

#### Officially Observed Sidecar Trial.

The official information regarding the sidecar ride referred to elsewhere in this issue is that the ride was abandoned at 1,086 miles through the driver falling asleep.

#### Benzole as a Substitute for Petrol.

The Petrol Committee of the R.A.C. are desirous of obtaining information regarding the use of benzole on all types of motor vehicles. Letters sent to the editor, and marked "Benzole," will be forwarded to the right quarter.

#### Next Year's T.T. Races.

F. A. Applebee, jun., will, of course, defend his title to the Senior Tourist Trophy next year, and among other intending competitors may be mentioned O. C. Godfrey and Harry Reed. W. H. Bashall will also defend his title to the Junior Trophy, thus making, with his brothers, a total so far of six entries.

#### French Events.

The meeting of the newly formed F.I.C.M. in Paris on December 14th precedes the date on which the Auto Cycle Club de France will hold its hill-climb at Gometz-sur-le-Châtel. Those who attend the conference will therefore be able to witness the hill-climb and also the Motor Shows in the Grand and Petit Salons.

#### A.A. and M.U. Notes.

**CYCLE CAR MEMBERSHIP.**—Motor cyclist members contemplating the adoption of cycle cars for the next season in place of motor cycles will be interested in knowing that such a change will not effect their rates of subscription, i.e., 10s. 6d. per annum. To retain the benefit of this low subscription, however, it is necessary that the total cylinder capacity of the cycle car engine does not exceed 1,100 cubic centimetres, and the weight of the chassis must not exceed 6 cwt.

**SPECIAL WARNING.**—By request of the Chief Constable of the Exeter City Police, the Association warns members and motorists generally that unless they drive more carefully along the Alphington Road (Exeter-Dawlish and Chudleigh), between the tram terminus and railway bridge (about one mile from Exeter), also on the Exeter-Crediton-Tiverton Road, between the Buller Statue (Queen Street, Exeter) and Cowley Bridge (fork of Crediton and Tiverton Roads), he will be compelled to institute controls on these roads.

#### The Wily Salesman!

An amusing story is told of a cycle car provided with the usual dummy radiator, through the meshes of which an air-cooled engine could be dimly seen. Save for frame and engine, the vehicle was unfinished, and so evidently came into line with the "new simple and cheap motoring." An expert salesman was seen lifting up the back portion to show a customer how little it weighed!

#### A.C.U. Silencer Tests.

The following firms have already entered for the tests: J. C. Lyell and Co., three silencers; A.B.C. Manufacturing Co., one silencer; J. Warley and Co., one silencer; and the Rover Co., Ltd., one complete motor bicycle with their own silencer.

The entry fees for the above tests are £2 2s. for the first silencer and £1 1s. for every additional silencer submitted by the same entrant. Entries close on December 31st, and should be sent to the Secretary of the Auto Cycle Union, 89, Pall Mall, S.W.

#### Non-stop Runs on the Road.

A month ago we were invited to observe an attempt to accomplish a twenty-four hour run on a sidecar without stopping the road wheels. We declined on the grounds that such an attempt would involve inconvenience to other road users, especially drivers of restive horses. We now understand that a similar application to the A.C.U. has elicited a reply in the negative, expressing the same views.

Dial of the Robinson indicator and mile recorder. A red hand (shown black) registers thousands, a black hand (shaded) hundreds, while a pointer (double line) registers the trip. The speed is recorded by the long hand on the left. It is handled by H. Taylor & Co.

#### SPECIAL FEATURES:

STATISTICS AND FEATURES OF SHOW MACHINES.

A NEAT TWO-SPEED GEAR.

A NOVEMBER TRIP ON A CYCLE CAR.

#### "The Motor Cycle" Show Report.

We have to thank readers for congratulations received respecting our report of the Olympia Show. The fact that the descriptions of machines were arranged in alphabetical order and under three separate headings was generally appreciated, as reference was rendered extremely easy.

#### Steel Cylinders for Record Work.

Is it true that Bailey attempted short-distance records last week on a Douglas fitted with steel cylinders? We are told by an eye witness that he was electrically timed by Major Lloyd. The engine had overhead valves, and was carefully kept from prying eyes.

#### Stolen Machines.

A 2 h.p. F.N., registration "LE 1116," was stolen from H. Douglas Leng, 164, Broadfield Road, Catford, S.E., on the 23rd ult.

A model G Douglas was stolen from the Berks County Council Offices, The Forebury, Reading, on Saturday last, the 30th ult. Registration BL 2,744, engine No. 6,619, frame No. 6,370. Particulars should be sent to E. O. Gerrard, Larkfield, Albert Road, Caversham.

#### Cut-outs on the Hammersmith Road.

It is astonishing that more discretion was not displayed by riders of motor cycles who used their machines to ride to and from Olympia. Some of them were attendants on the stands. Racing taxicabs on the Hammersmith Road between 10 and 11 p.m., with cut-outs wide open, may be fine sport, but it somewhat counteracts the good effects of a smart show. Some of the remarks passed by visitors leaving Olympia show that such conduct was not calculated to assist the movement.

#### Reliability Trials.

A cycle car reliability trial in Scotland is suggested by Mr. Massac Buist in *The Motor World*. Certainly a good idea, but was not a special passenger class set aside in connection with the Scottish Trials arranged by the Edinburgh M.C.C. last July, and is almost bound to be repeated in 1913? Furthermore, the A.C.U. Six Days' Trials last August drew entries for cycle cars, and a special class for these vehicles will certainly be included next year. Scottish roads may be traversed if the suggestion to combine the two events and extend the trial to ten days be adopted.

**British Motor Cycles at the French Show.**

The Williamson must be added to the list of British machines to be exhibited at the Paris Salon this month.

**Three-speed Counter-shaft Gears.**

"Ixon" predicts that the change-speed gear of the future will have three speeds and be located in the bottom bracket.

**Petrol Consumption Tests in New Zealand.**

In a recent petrol consumption test in New Zealand, the winner, J. Davies, is credited with covering the whole course of fifty-two miles on a  $3\frac{1}{2}$  h.p. B.S.A. roadster with a consumption of  $38\frac{1}{2}$  ounces of petrol, which works out at an average of 216 miles to the gallon.

**First Cycle Car Trial.**

A cycle car trial is being organised by the Sutton Coldfield and Mid-Warwickshire A.C. for Saturday, the 21st inst. It is open to members only. The course will be to Banbury and back, including Sunrising on the way out and Edge Hill on the journey home. Schedule speed, 18 m.p.h.

**Nice-La Turbie Hill Climb.**

Several entries have already been received for the Nice-La Turbie hill-climb, which will be held on the 15th inst. Among the machines which will be ridden are the Peugeot 5 and 6 h.p. twins. Moto-Réves, Magnat-Debon, Terrot, and two machines fitted with Moser engines, as illustrated in our issue of the 21st ult. Entries close on Sunday, December 8th, at midnight, and should be sent to the Nice Motor Club, Nice, France.

**Gometz Hill-climb.**

We have received an official communication from the Auto Club de France, 49, Rue Lepeltier, Paris, that the Gometz hill-climb will take place on Sunday, the 15th inst., the day after the International Conference of the F.I.C.M. at the Automobile Club de France. Machines will be divided into the usual classes, namely, up to 250 c.c., up to 350 c.c., and up to 500 c.c.; three-wheeled motor cycles (i.e., triars and sidecars) up to 350 c.c., 500 c.c., 750 c.c., and 1,000 c.c. All vehicles of this class must be fitted with a free engine clutch of some kind.

The voiturette or cycle car class will be open to vehicles with single, twin, and four-cylinder engines as follow: Singles, maximum bore 90 mm.; two cylinders, 85 mm.; four cylinders, 65 mm.; and belt-driven machines where the engine does not exceed the dimensions of the three first classes. The competition is confined to touring vehicles. To all competitors who are A.C.U. members taking part in this event the A.C.U. extends its valuable touring facilities.

Those who intend to compete should communicate at once with the secretary, 39, Pall Mall, S.W.

We have received a letter from the committee of the A.C.F., in which they ask us to transmit any entries received direct to them. Entries may therefore be addressed, The Editor, 20, Tudor Street, E.C.

The medals won by the English competitors in last year's event will be presented to them on this occasion.

FUTURE EVENTS	
Dec. 7.—M.C.C. Annual Dinner and Prize Distribution.	
" 11.—Herts. County A.C. Open Quarterly Trial.	
" 21.—Sutton Coldfield and Mid-Warwickshire A.C. first Cyclecar Trial.	
" 27-28.—M.C.C. Annual Winter Run.	
Jan. 1.—A.C.U. Open Silencer Trial.	
" 18.—North Middlesex M.C.C. Open Trial.	

**Show Attendance.**

On Wednesday of last week 6,000 more visitors passed through the turnstiles of Olympia than in any previous year of the Motor Cycle Show, the total number being 27,334.

**Returning to the Antipodes.**

S. L. Bailey is leaving for Sydney, Australia, on the 16th inst. Not long ago he wagered that he would have most of Class B records to his credit before leaving these shores, and by the aid of his little Douglas he has accomplished his ambition. Bailey will be greatly missed at Brooklands meetings.

**Death of Mr. J. W. Davis.**

We very much regret to report the death of Mr. J. W. Davis, late managing director of the Enfield Cycle Co., which occurred on Tuesday last week. The funeral took place on the 29th ult. at Redditch cemetery. Mr. Davis was only 39, and his long and severe illness and death are among the saddest things that have occurred in the history of the motor cycle industry. We offer our sincere condolences to his widow and family in their sad bereavement. Mr. Davis was well known throughout the trade and was respected by all; his loss will be severely felt.

**Paris Show.**

There will be an overflow exhibition near the Grand Salon, Paris, which will be known as the Petit Salon. This will open on the 14th inst. The big show opens next Saturday. A description will be published in our next issue.

**Lighting Byelaws.**

With reference to the lighting byelaws of the Glamorganshire County Council, recently referred to in an article in this journal, we wrote to the clerk to the Glamorganshire County Council pointing out the reasons why we considered there was nothing in the byelaw which required two red rear lamps to be carried on a motor cycle with sidecar attached, and have now received a reply stating that the matter has had further consideration, and the note endorsed on the byelaw now reads as follows: "And also a lamp or lamps showing a red light to the rear." This confirms our view that only one rear red light is necessary in this county.

**W. H. Bashall's Stud.**

We had an interesting chat with W. H. Bashall at the Show last week. He has mapped out a competition programme for next year which should keep him busy. He will defend his title as holder of the Junior T.T. on a Douglas, and will also ride in the Senior race, probably on a Triumph. Before that date he will compete in the M.C.C. London to Exeter Run at Christmas, and also in the Paris-Nice-Monte Carlo event next February, details of which were published last week. For private touring work, Harry Bashall has ordered a 1913 Phelon and Moore, believing that it is unwise to use special competition mounts on the road more than can be helped. His brothers, Aubrey and J. T. Bashall, will also compete in the Tourist Trophy Races.

A WINTRY SCENE IN THE PEAK DISTRICT.

An Enfield rider finds the snowy going somewhat difficult in Buxton.

## SHOW GOSSIP.

Business at the Show was excellent. Several firms will have the greatest difficulty to deliver all orders received during Show week before the 1913 Show comes round.

Are we to have a cycle car race in the Isle of Man next year? The suggestion was put forward in these columns some weeks ago, and we notice has been revived by a contemporary.

The general opinion of the cycle cars at Olympia was that half of them had not had a severe enough testing on the road. Some of the features came in for much criticism. It is common knowledge that a number exhibited last week had not had a proper testing on the road.

Quite a smart idea was that of the Rudge Co., who had a shorthand writer jotting down the criticisms of Show visitors regarding their cycle car. These opinions should prove of great service and guidance to the designers.

It will be illegal to use one or two of the cycle cars which were shown at Olympia on the road, as they possess no reverse and are over the weight allowed without one.

There is no hiding the fact that many who a week or two ago had intended ordering sidecars at the Show were unsettled in their minds by the number of cycle cars. We encountered many such, who, however, were afraid to take the plunge and speculate in a cycle car, so they are waiting.

Old hands at the game freely expressed the opinion that some of the hurried examples of cycle cars will give their owners trouble before the touring season commences.

Mr. F. W. Barnes told us that there were two or three glaring copies of his patented Gradua gear, and he was commencing proceedings.

Despite the waverers who withheld their orders, sidecar makers experienced a large demand, and many are booked up for months ahead. Our statement last week that there will be a great many more sidecars on the road in 1913 will be fully borne out. It is far from being replaced by the cycle car, as some would have us believe. The low first cost and economical running expenses are bound to appeal to many for some time to come.

There were important meetings at Olympia practically every day.

Mr. W. E. Brough was in the best of spirits on Saturday, having taken over five hundred orders, though half that number represented his most sanguine expectations when the Show opened.

The Singer, as we predicted when first dealing with the cycle car in these columns, was a centre of attraction. Mr. Bullock, the works manager, told us that so many orders were taken that a special meeting was held to consider whether all could be executed in view of the work already in hand.

Norman Longfield, the one-time amateur rider of a Scott, has joined the Scott Engineering Co., and attended at the firm's stand at Olympia.

The Perry and Swift cycle cars were giving trial runs for the first time on the road, and were much admired.

In two cases—at least the prices of cycle cars were advanced on the opening day of the Show.

The number of true cycle cars in the Show could be counted on the fingers. The others are better termed miniature cars, though everyone will agree they are no worse for that—probably better at the present stage.

Another twelve months will do the runabout movement a great deal of good.

Clyno, Enfield, and A.J.S. sidecars will be difficult to obtain at once. All three firms have large contracts in hand.

The demonstration four-wheelers certainly scored last week. When it commenced to rain, up went the hood, and both passenger and driver were protected from the elements. This is a point that weighs considerably in the sidecar *versus* cycle car controversy, though, of course, one has to pay dearly for such an advantage.

The B.S.A. Co. will pursue an active competition programme in 1913, we understand, entering a team of riders in the more important events. F. W. Applebee is booked to ride a B.S.A. next year, including the Tourist Trophy Race. This event is the one the veteran rider is most looking forward

*The Motor Cycle* circulation last week, certified by our chartered accountant, was 83,081.

We notice that one firm has adopted the title "The Rolls Royce of Cycle Cars" for its new production. Strangely enough, this is just the type of machine some correspondents have declared they do not want. They may change their opinions before long.

The "amateur" question has been settled by a decision to classify competition riders as "novices" and "experts." Some years ago we suggested in a leaderette classifying riders as "maidens," "juniors," and "seniors," as in rowing. Mr. Loughborough, the A.C.U. secretary, must be given the credit for carrying the scheme through.

Trial runs were greatly appreciated. The engines of some of the cars were hardly stopped, for, as one stepped out, there was usually another ready to occupy the vacant seat.

The Motosacoche Co., who exhibited last week a new twin 750 c.c. engine, will shortly be marketing a Motosacoche sidecar machine with chain drive and two speeds to which the above engine will be fitted.

Presumably, as a reply to an article published in *The Daily Mail* of last Wednesday, which conveyed the impression that both three-wheeled and four-wheeled cycle cars were an absolute novelty, Auto-Carriers displayed a big sign on their stand on Thursday which read, "Alone in 1907, foremost ever since."

Once again so-called "stand to stand show reports" included machines not in the Show at all. *The Motor Cycle* report was, as usual, written in the Show, and supplies of the number were on sale at Olympia on Tuesday evening.

The A.C.U. did excellent business at its stand at Olympia. The three R.A.C. guides were never idle, and in the week enrolled over 250 new members and sold many of the handsome new badges, which can now be obtained for 3s. Secretary Loughborough moved his office from Pall Mall to Olympia for the whole week, and put in a very busy time with general work and numerous committees and conferences. The Prince's Rooms were much used and greatly appreciated.

Each day of last week at the Hammersmith road entrance to Olympia a busy and animated scene was presented. Here the cycle cars were awaiting visitors who desired trial trips. The runs were made around the adjacent roads and streets.

**Bury and District M.C.C.**

A meeting will be held at the Royal Hotel, Silver Street, Bury, this evening (Thursday) with the object of forming a club with the above title.

**Manchester Amateur M.C.C.**

The club dinner and distribution of prizes will be held at Ingham's Hotel, Chorlton Street, on December 12th at 7 p.m. followed by a smoker.

**Streatham and District M.C.C.**

The next three items on the winter programme are: Saturday, December 7th, club supper at headquarters, 8.15 p.m.; Friday, December 15th, there will be a discussion at headquarters on "Which will survive, the cyclecar or the sidecar?" at 8.30 p.m.; Friday, December 20th, there will be a lecture at headquarters at 8.15 p.m.

**The Cycle Car Club.**

The general meeting of the above club was held in the Pillar Hall, Olympia, on Friday evening last, and was attended by about forty-five persons. Mr. Glyn Rowden presided and explained to those present the aims and objects of the club. The business of the meeting consisted of adopting the rules, deciding to affiliate to the Auto-Cycle Union, and to get out a suitable badge. The first meet of the club will take place at The Hut, Wisley, at 1 p.m. on Saturday next, the 7th inst. Thirty-nine founder members were enrolled at Olympia.

**Mersey (Liverpool) M.C.**

This club had a most successful gathering on the 22nd ult. at headquarters, St. George's Restaurant, Redcross Street, Liverpool, about seventy members being present. At the conclusion of the dinner the report of the year's working was read by the hon. secretary, Mr. S. W. Carty, who stated that the membership of the club is now 130. Membership includes affiliation to the A.C.U. and association to the R.A.C., and to show that this was no empty honour, the Hon. Secretary mentioned that five members had received free legal assistance during the season, with the result that in three cases the charges were dismissed, and in the other two only nominal fines were imposed. Fifteen competitions took place, of which four were open trials, a record for any club. Officers for 1913 were elected as follows: President, Mr. F. Rees; captain, Mr. V. Horsman; hon. treasurer, Mr. F. Smith; hon. secretary, Mr. S. W. Carty. A proposal was brought forward to change the name of the club, and after considerable discussion it was agreed to alter it to Mersey (Liverpool) Motor Club. The evening was concluded by the prize distribution and a smoking concert.

**Sheffield and Hallamshire M.C.C.**

The annual dinner and prize distribution will take place at the King's Head Hotel this evening (the 5th inst.), at 7.30.

**Tyldesley and District M.C.C.**

It is proposed to form a motor cycling club in the district. Riders wishing to join are requested to be present at a hot-pot and smoker to be held at the Star and Garter Hotel, Tyldesley, on December 11th, at 7 p.m.

**Birmingham M.C.C.**

The annual Christmas reliability run, Birmingham to York and back, will be held on Saturday, December 26th, starting about 6 a.m. and finishing about 9 p.m. the same day. Full particulars are obtainable from the trials hon. secretary, Mr. S. C. Perryman, 67, Wood End Lane, Erdington, Birmingham.

**York County M.C.C.**

Speed trials were held on the 23rd ult. on a secluded road near Harrogate. The event was run on handicap, and results are as follows: 1. H. Waterman (6 h.p. Bat), gold medal; 2. J. C. Bennett Mitchell (Douglas), silver medal. Fastest time, J. A. Prendergast (3½ h.p. Ivy-Precision), silver medal. The annual dinner will be held at headquarters on the 13th inst.

**Cambs. M.C.C. v. C.U.M.C.C.**

On Thursday, November 21st, a reliability trial was held between the Cambridge University M.C.C. and the Cambridge M.C.C. The teams consisted of seven a side—five solo and two passenger machines. The result was a win for the Cambridge M.C.C. by the narrow margin of one mark. The route was as follows: Cambridge, Barton, Haslingfield, Barrington Hill, Orwell, Wimpole (check), along the Old North Road to Gamlingay via Croydon Hill (secret check), Potton, Biggleswade, Baldock (check), Ashwell Station Road (check), Royston, along the road to Newmarket (secret check two miles from Royston), turning through Whittlesford and Shelford, and home to Cambridge. The distance was fifty-nine and a half miles. Marks were deducted as follow: One mark for each half-minute early or late at check, ten marks each tyre stop, twenty marks each mechanical stop. The use of speedometers was prohibited, but watches were allowed. Specially good performances were made by the three Morgan runabouts (driven by C. W. Wilson, M. B. Stewart, and F. T. Cox), B. L. Peters (Rover), M. E. Wright (Scott), I. H. McClure (7 Indian), and P. V. Smith (Rover).

R. Holt (Singer) lost twenty marks through a skid, and H. V. Simpson (3½ Premier) failed on Croydon Hill.

**BRITISH SIDECARS IN CANADA.**

Toronto sidecarists who took part in the first organised sidecar run ever held in Canada. Naturally the procession caused considerable stir in the villages through which it passed. All the machines are British made—Triumph motor bicycles and Millard sidecars.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the "Editor, The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

#### Tyre Wear.

Sir,—“An Old Reader” asks for suggestions for obviating the wear on the bead of his tyre. I had constant trouble of that kind with one wheel till I discovered that the rim was faulty (the two grips were unequal) and got it replaced with a standard rim. Of course any rim that is allowed to get rusty will rot the bead. S

#### Wear of Big End Bearings.

Sir,—I should like to invite your readers' opinions upon the subject of the wear upon big end bearings. I have, of course, read with great interest your articles on this and kindred subjects, but an ounce of practical experience is worth a whole page of theory.

In my own case, I had the big end bearing of my motor cycle taken up last June, and have since done about 3,000 miles. On taking the cylinders down to remove carbon, I find the big end bearings again show considerable wear. This, in the face of being continually told that I was over-oiling, seems excessive.

I trust this will be of sufficient interest to induce other readers to give their experiences and opinions. N.H.

#### Evolution of Cycle Cars.

Sir,—With regard to your article on “Evolution of Cycle Cars” and the letter written by H. W. Bartleet in the last issue, I have by me at the present time a small Decauville which was bought about twelve years ago. I believe it took part in the London to Brighton event. It was fitted with a twin-cylinder air-cooled 5 h.p. engine and three-speed gear, with accommodation for three passengers, total weight about 5 cwt. This came well within the range of cycle cars. It is now going through the mill for a three-wheeled cycle car. I am fitting a De Dion engine with a two-speed gear, chain and belt drive, and water-cooling. I have cut away the whole of rear frame, lengthened the main chassis tubes, built up a back wheel on an old hub from a De Dion car, taking a 700×85 mm. tyre, two bucket seats fitted with Brooks springs; when completed I will send photographs of both. E. A. JOHNS.

#### A Show Grievance.

Sir,—I have one grievance to ventilate on the subject of the Show, which applies to the majority of stands I visited. I was only able to be there for a short three hours on Monday morning, and, only visited about twenty stands (accessories about ten). I was unable to get catalogues from more than one-third of these; in fact, I could mention one stand in particular, showing an accessory which will probably become the rage as regards lighting, where there was absolutely nothing done at eleven o'clock. At half-past twelve their articles were laid out, but there was nobody to tell one anything, nor was a printed leaflet of any description available. I do think, seeing that there must have been many people like myself—up for the week-end and only able to spend a couple of hours at the Show—that firms should have everything that might possibly be wanted ready to the tick of 10 a.m. E.C.

#### A Family Coach.

Sir,—Enclosed is a photograph of my 7 h.p. Bat and Phoenix sidecar. The machine has now run its fourth season, and I have travelled on it thousands of miles with my wife and child.

The sidecar, which is fitted with a Chater-Lea spring wheel, is the acme of comfort. Of the two I prefer the sidecar, but my wife likes the saddle best, and she thinks it delightful to sit over a big engine and to be able to make it do almost what she likes, while the spring-frame Bat causes no discomfort even to a lady rider.

I have the sidecar on the right-hand side because I can get at the clutch, carburetter, and belt, and I have also fitted a starting arrangement, which consists of an extended back axle nut on which slips a bicycle chain wheel and crank. At the other end is a free-wheel sprocket screwed on the end of the Millennium Fit-all gear. The two are connected by a bicycle chain of suitable length, and starting is quite an easy matter. The Fit-all gear has been in use three seasons.

The additional cross arm which is fixed to the handle-bars by means of clips extends to the front of the sidecar seat, and the control levers can be fixed on it when I want to drive solus from the sidecar seat, as I often do.

The Whittle belt of lin. section is the same as supplied when the machine was new, and it is protected by a patent leather shield (home-made) which runs round over the back tyre and along the underside from the bottom of the mud-

A 7 h.p. Bat and sidecar, illustrating the letter signed T. Enderby.

guard to the crank case. The cover on the front wheel is the original one. The back wheel, however, has demolished a host of tyres, but the substitution of a 2½ in. flat base rim (voiturette) and a 650 × 65 mm. Shamrock Excelsior combination cover, seems to have ended my troubles there, for after 1,400 miles running with full load all the time there is hardly any perceptible wear upon it.

Wishing good luck to *The Motor Cycle*, and thanking you for the energetic part you took in regard to the recent attempt to impose additional taxation upon us.

T. ENDERBY.

**The Transmission Question.**

Sir,—I have read with interest the letters appearing in your paper re wear of small twin engines and transmission. In April last, as I could not obtain another well-known 2½ twin at the moment, I was induced by the agent to take a 2½ two-speed Royal Enfield. I was suspicious of the chain drive at the time, having only owned a belt-driven machine previously, but since the month mentioned I have done between four and five thousand miles, and still have the original chains in use, and they do not yet show signs of wear. The engine has not required any new parts and no attention beyond valve grinding three times.

I have had four nails in the back tyre, which are my only stops. The original Dunlop covers are still in use, although the back one will soon require renewal.

I ride for business purposes all over the South of England (including Devonshire), and have never found any hill too stiff for my machine to tackle.

**CHAIN DRIVE CONVERT.**

Sir,—In your issue of the 21st ult. I notice that you make mention of the different forms of drive in the following order: Belt alone, chain alone, and then combined belt and chain. Now I am greatly puzzled to know why makers do not go in for the belt drive with under-geared pulley, especially for lightweights. The advantages of this device are: (1) Large belt pulley; (2) the pull of the belt is taken off the crankshaft bearing and is taken up on a bearing which can be made the full width of the engine if necessary; (3) the transmission wheels, which of course are on the side of the engine remote from the belt, are enclosed and run in oil, and practically require no special attention.

Now, while the combined drive gives a large belt pulley, still the introduction of the chain means the introduction of something else liable to go wrong—either to break, stretch, or get dirty if not enclosed. It also means, as a rule, a shorter belt drive, which is not an advantage.

I may say that my own mount is fitted with an under-geared pulley and is most satisfactory, and I consider the arrangement worthy of more general adoption, especially as the usual design of engine would seem to lend itself quite readily to the device, most engines having already some kind of geared shaft to actuate valves, etc.

**UNDER-GEARED.****The Wear of Small Engines.**

Sir,—I notice Mr. Claude Middleton in your issue of November 14th desires the experiences of riders of 1912 Douglas machines.

My Douglas was new at Whitsuntide and has since covered 3,900 miles (by speedometer) with only two involuntary stops. These were caused by a broken belt-fastener and exhaust valve rocker arm; both happened in the first 200 miles, and the broken parts were replaced free by the Colmore depot. In the case of the valve rocker, I did thirty miles quite comfortably on the front cylinder only. I have had no punctures, but as the back tyre began to go at the beads, it was replaced by a new one at the end of 1,800 miles, the makers allowing me half-price for the old one. The front tyre still has the centre row of studs, and the new tyre which I put on the back shows practically no signs of wear. Nothing on the machine beyond those points mentioned has required replacement, and I cannot detect any signs of wear in the engine; the compression is better now than when new. The original Lyso belt, beyond cracking across the grooves on top, looks almost as good as new. My total petrol consumption, including that used for cleaning and lost by evaporation, etc., works out at 125 miles per gallon. I beg to add the usual disclaimer.

E. P. LUCKING.

**Power for Sidecar Work.**

Sir,—I have been a regular reader of your excellent paper for many years, and this is the first time I have ventured to trespass upon your valuable space. My reason for so doing is to say a few words about my combination which may be of interest to your readers. A great deal has been said for and against the 3½ h.p. as a sidecar machine, and I do not think that the climbing of freak hills with a dozen passengers has helped in any way to convince the prospective and incredulous buyer.

I shall be classed as a "potterer," for I never care to average more than the speed limit, unless in open country

and pressed for time between services, which sometimes happens. My machine is a 3½ h.p. T.T. Triumph, N.S.U. two-speed gear, and a sidecar made by the Gosford Engineering Co., Coventry. I cannot, of course, relate such experiences as appear in the two letters of your issue of the 21st ult., for I do not wish to figure in the police court on the charge of cruelty to engines. I have driven a sidecar (wicker) for some years; but a few months ago you illustrated what seemed to me one of the soundest constructions of sidecar that I had seen, a patent of the above company. I wrote the firm, and they advised a coach-built body with hood and screen. After a thorough test I am more than satisfied with the combination: the machine does not appear to mind the weight, which is not excessive—just over 90 lbs.—owing to the light, yet exceptionally strong, chassis, which is of channel steel and in one piece. There are no brazed joints or weak points; the springs are full elliptic, like a car; indeed, it is a miniature car. In former years I have gone in fear of an accident on bad roads, but not now. I have not had to change down yet for any main road hill, my low gear being used only for corners and traffic, but the feeling of safety is to me the great factor, as good people are very scarce! The steering is very easy, owing, I think, to its semi-flexibility—universal joints—which prevents any jar and yet is sufficiently rigid to prevent sideslip. For lightness, comfort, ease of steering, and safety it will be hard to beat.

(Rev.) T.W.

**'Shape of Combustion Chamber.**

Sir,—I fear "Magneto" is not to be congratulated on the simple explanation of the main point of his recent article. He sets out to prove that the combustion chamber presenting the minimum surface—the spherical—may be efficient but is not suited to hill-climbing, but fails because he cannot distinguish between heat abstracted from the charge and heat dissipated from the cylinder walls. The combustion chamber with the greatest area plainly absorbs the most heat, which is quite different from dissipating it.

Supposing we take some figures to show the matter clearly. Two cylinders, say, have a combustion chamber surface of 200 and 400 sq. cm. respectively. Take the temperature of the gases on the firing stroke at 1,500°. Then the heat absorbed by the two cylinders will be in the ratio of 300,000 and 600,000 respectively; that is, the cylinder with the largest surface will hold twice the heat and will require twice the radiating surface if the temperature is to be equal.

If "Magneto" thinks a moment he must realise that the coolest cylinder is the one that presents the least surface to the charge and the greatest surface to the air. The spherical combustion chamber gives the former, and the latter is a question of radiating surfaces.

GEO. H. CUTBUSH, A.M.I.A.E.

**Proposed A.C.U. 1913 'Ten Days' Trials.**

Sir,—I see that it is suggested that these trials would be held next year at Kendal, and I would like to put forward one or two criticisms and suggestions thereon.

Holding a six or ten days' trial from one headquarters inevitably means that some of the days are employed in simply making up mileage over flat uninteresting roads that form no test of the machine, and are dreadfully monotonous to the rider: such days this year as the ride to Bournemouth and back and the return from Gloucester.

I would suggest that next year the trials should be held from several headquarters, having, say, two days in Devonshire, so as to include Porlock, Lynmouth, Beggar's Roost, and the best of the remaining hills; two days in North Wales, including Pen-y-bal and other notorious hills with unspellable names; two days in Cumberland, like the recent A.C.U. Quarterly Trial; and the remaining time essaying some of the Scottish pumplees. Hill-climbing is the only thing that breaks the monotony of those long rides, and such a trial as I have outlined would not only be saved from monotony, but would form a real test of the machines, and none but the very best would gain gold medals.

An additional advantage in spreading the trial over several districts is that it arouses interest among so many more people, and it would be less tax upon the local clubs in arranging and marking out the courses.

I do not agree with a recent writer to your paper that a thousand miles run over main roads forms a real test of a

machine. A machine that will not stand that is not worth looking at, but a machine that will stand such a strain as this year's Six Days, or the A.C.U. Quarterly, or the Liverpool One Day Trial is a machine to be relied upon, and you can be sure of getting value for your money.

I am afraid that increasing the trial to ten days will mean eliminating amateurs from the competition, as very few will be able to spare so much time, or if they could spare the time will not be able to afford the heavy cost. This might to a large extent be mitigated and amateurs encouraged by dividing the trial into two parts of five days each at a reduced entrance fee, awarding the usual medals to those successful in either of the five days and special prizes to those successful in the ten days.

I hope that the intending entrants, including some of the trade riders, will write and give their views on the trials and these suggestions.

DENARIUS.

### Silencers

Sir,—The L.G.B. have now issued their regulation prohibiting cut-outs on motor cycles after March 1st. The daily papers, in commenting upon it, congratulate the community on the fact that it will stop the practice of careering about with open exhausts, so dear to the hearts of certain young idiots. This is true, but it does not seem to me that it prohibits the standard cut-out as fixed to the majority of machines, which merely opens extra holes in the silencer. The noise made by a roadster single is very slight when throttled down, even with the so-called cut-out open, and if that is so, and the gases pass through a silencer, the regulation is complied with. This point is of considerable interest to the very large number of riders who will not be able to buy 1913 machines. My 1912 single, of very famous make, will not climb a gradient of 1 in 12 with the cut-out closed, but will fly up when it is open. What is to prevent me taking off the cut-out fitment and having the extra holes permanently open? I can then say I have no cut-out, and as the noise is very slight at 15 to 20 m.p.h. the police could not interfere.

H. C. WYLEY.

Sir,—In the commentary of "Red Wheels" on the compulsory silence question, may I point-out a few misstatements that have been made by him?

In the first instance, the noise made by the exhaust of the majority of motor cycles has become an intolerable nuisance both to the ordinary user of the roads and to people whose houses adjoin them. Whatever "Red Wheels" may say to the contrary, very few motor cyclists close the cut-out of their machines when driving in town or village; in fact, that is just the opportunity for the fraternity of the dropped handlebars and weird attire to distinguish themselves.

"Red Wheels" next asserts that "the motor cyclist must have efficiency," but may I remind him that efficiency and noise are not synonymous terms. Experiments have proved that the increase of horse-power developed by an engine with an open exhaust over one fitted with a good silencer is barely if at all perceptible.

The next statement of your contributor, "That the silencer of 1913 will be neither free nor silent, but just sufficiently silent to escape trouble with the police," is, I think, a rather unfortunate statement to make, as if he and others of similar views intend to exercise their ingenuity in discovering the limit of the forbearance of the local authorities, the foolishness of any such procedure is obvious. For if these motor cyclists get so perilously close to the edge of what is considered reasonable in districts where the police view the matter leniently, they will probably find themselves in trouble if they pass through places where the regulations are stringently enforced.

If we accept "Red Wheels's" concluding statement that "a silent machine constitutes itself a danger to the public," why close the cut-out in a town or village where it is most required and open it in the deserted country places? If a machine is such a menace to public safety that it is necessary to herald its approach with a noise like a gatling gun, then it has no right to be on the road at all.

I fail to see that the advent of the silent motor car has engendered an epidemic of accidents because of its silent running, and if the motor cycle is fitted with efficient brakes, and is driven with the consideration due to others, I cannot

believe that the new regulation will convert it into a modern Juggernaut.

I do not wish to defend the Local Government Board, but we must remember that it is the irresponsible members of our own ranks who have brought this draft into being. The public think the noise of motor cycle exhausts is excessive, and as we are such a small minority of the community surely the great majority have a right to place some restriction on what they consider a nuisance. Motor cyclists have been warned time and time again through your editorial columns that unless the noises were abated the Government would take the matter in hand, but little notice was taken of your timely advice.

I give "Red Wheels" every credit for his good intentions, but am afraid he displays more zeal than perspicacity in his handling of the subject, and must warn him that if he makes dogmatic assertions which he cannot support then his opinions degenerate to fatuity. Because others do not see eye to eye with us, it is rather unwise to presume they lack intelligence. I think it would be as well to avoid calling any further unpleasant attention upon ourselves by flouting the Government regulations.

I hope this will be a lesson to motor cyclists, and that in future the advice of *The Motor Cycle* will receive the respect due to its intimate acquaintance with the trend of things.

As regards "Red Wheels'" insinuation that at present manufacturers cannot make an efficient silencer, I will leave those manufacturers who claim silence and efficiency to defend their claim against that. The L.G.B. demand the silence, and for the other *dum spiro spero*.

L. J. AUSTIN.

[Expressions of opinion can hardly be characterised as mis-statements. The authorities already have full powers if they care to use them.—ED.]

### M.C.C. London-Exeter Run.

Sir,—With reference to the London-Exeter run, would it not be much fairer to put all lightweights into a separate class? Take the case of an amateur rider of a 2 h.p. machine over a course of, say, 200 miles. The set speed is 20 m.p.h., and his little machine is expected to adhere to this as closely as a big twin of four times its power.

I would suggest that in future winter trials lightweights be put into a separate class, with a set speed of 15 m.p.h., or, if lightweights and heavyweights are to be run under equal conditions, that an award should be given to every lightweight completing the course.

CECIL PEERS.

### The Care of Tyres.

Sir,—I have noticed a lot of comment in *The Motor Cycle* lately as to the wear of tyres on motor cycles, but I have looked in vain for any statement as to the care riders give to their tyres.

I have a rather heavy tricar with a compressed tread Rom cover on driving wheel, which has done over 1,000 miles, and the diagonal bars are only very slightly worn in the centre as yet, and it is otherwise unscratched, and I do not think it has had the pump used on it but once since it was put on, although the Dunlop inner tube is some years old.

After every two or three rides I wash the covers with a damp cloth and carefully look round for any small pieces of flint, etc., and if I find any extract them, and if the hole is large enough ram in a little tyre stopping. I think the life of the tyre is considerably prolonged by this practice, besides giving the wheels an improved appearance.

F. VALLIS.

### SUMMARY OF CORRESPONDENCE.

Will W. A. Hallsworth, designer of the hand-starting device for the four-cylinder F.N., kindly communicate with us as we have several enquiries waiting for him?

### NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

# THE INTERNATIONAL FEDERATION.

Luncheon at the R.A.C. and Conference at Olympia.

As announced in our last issue, the delegates representing France, Italy, Denmark, Holland, America, Canada, and England, met together in London last week, and on Thursday were received at the Royal Automobile Club by the Hon. Arthur Stanley, M.P., Mr. J. W. Orde (Secretary R.A.C.), Colonel H. C. L. Holden, R.A., F.R.S., Messrs. Robert Todd (Chairman), T. W. Loughborough (Secretary A.C.U.), Otto Thomas, G. F. Sharp, L. M. Meyrick-Jones, J. R. Nisbet, and E. M. P. Boileau (Chairman of the International and Relations Committee of the A.C.U.) Only one delegate (the Vice-president of the Danish M.C.) was absent, but Danish interests were ally represented by M. Mathiesen.

After the reception in the Great Hall of the R.A.C., the company adjourned to lunch in the private luncheon

The Chairman, speaking in French, then pointed out that such affairs must be discussed in French, and M. Tontlemonde bade adieu to Mr. Stanley and withdrew. Mr. R. toe Laer (Holland) then asked if anyone objected to the members of the A.C.F. representing France, which question the chairman put and no objection was offered.

The meeting then proceeded to the election of delegates, and the following representatives of the different countries were duly elected: MM. E. Beukelar, Fagard, and Michaut, members of the Commission Mixte de du R.A.C. Belge (Belgium); Mr. W. H. Wells, the Canadian Motor Cyclists' Association (Canada) and the Federation of American Motor Cyclists (America); M. Mathiesen (Denmark); Messrs. E. M. P. Boileau, T. W. Loughborough, L. M. Meyrick-Jones, and G. F. Sharp (England); MM. Longuemare and Fenton, sen. (France); M. toe Laer, Dutch M.C.C. (Holland); and il Dottore Oreste Togni, Presidente del Moto Club d'Italia (Italy).

On the proposition of Mr. E. M. P. Boileau, seconded by Mr. R. toe Laer, the Marquis de Mouzilly St. Mars was elected patron of the International Federation; and, on the proposition of M. Longuemare, seconded by Mr. Wells, the Hon. Arthur Stanley, M.P., was elected president, while it was decided that each club should nominate its own vice-president in its own country.

Colonel Holden then made the following proposal, which was duly carried:

"That those representatives present who were members of the F.I.C.M. in the past should undertake to renew their support, and those delegates present who represented other countries should undertake to persuade the bodies which they represented to join the new Federation."

M. Longuemare then invited the delegates to meet in Paris on December 14th to discuss the rules.

Front view of the improved Singer cyclecar, from which it will be noticed that the radiator has been slightly enlarged.

room. The Hon. A. Stanley presided, M. Longuemare sitting on his right and the Dottore Togni (representing the Motor Club d'Italia) on his left. After luncheon the delegates were shown over the R.A.C., and were then conveyed in cars to Olympia, where, after a short interval, during which they viewed some of the exhibits, the party adjourned to the Pillar Hall, where the conference was held.

The Hon. Arthur Stanley, who was in the chair, welcomed those who had responded to the Auto Cycle Union's invitation. He said he ought to explain that the Federation was already in existence. It originally consisted of clubs representing France, Germany, Austria, and England. The three former clubs dissolved or resigned and England alone was left. He proposed that the Federation should be resuscitated in preference to founding a new body, as the latter procedure would involve the loss of the funds the surviving body still possessed.

There then ensued a brief discussion, which took place in French, between M. Tontlemonde, representing the newly-formed Federation of (Provincial) Motor Cycle Clubs in France, and Messieurs Fenton and Longuemare, representing the Competitions Committee of the Automobile Club of France.

Delegates from all parts of Europe at the Meeting of the International Federation of Motor Cycle Clubs. Our photograph was taken at Olympia where the delegates were entertained to tea. Reading from the left,—1st Row—(seated) Col. Holden, Messrs. Mathiesen, R. toe Laer, O. Guillot, Hon. Arthur Stanley, Messrs. G. Fenton Senr., G. Longuemare, and Robert Todd.—2nd Row—Messrs. J. R. Nisbet, S. T. Tessier, J. W. Orde, W. Pratt, G. F. Sharp, A. Michaut, Dr. O. Togni, T. W. Loughborough, W. H. Wells, L. M. Meyrick-Jones.—3rd Row—E. M. P. Boileau, G. Fenton, Jur., Otto Thomas, G. Sweerts,—Neher, H. Fagard.

## ROAD ACCIDENTS.

A SECTION of the daily press is constantly publishing articles intended to stir up interest in road accidents of all kinds, among which motor cycle and motor car accidents are not the least prominent. It is really difficult to see what advantage is gained by giving these unfortunate accidents so much publicity. The amount of road traffic, motor and otherwise, is now enormous, and human nature being what it is, some accidents are bound to occur.

We do not for a moment pretend that many of the accidents could not be avoided by care on the part of the driver, but in nine cases out of ten the cause of an accident might quite well be through carelessness on the part of a pedestrian, cyclist, horse driver, or the driver of any other vehicle. It usually takes two to cause an accident, and it appears that those who report these unfortunate incidents seem to lose sight of this fact altogether. Times out of number a man gets run down by a motor cycle simply because he suddenly steps off the pavement without looking where he is going, and then the accident, but not the real cause of it, is given the fullest publicity in the daily and evening papers. By this means the man in the street is badly scared, local magistrates become panic stricken, and persecution of motorists which is totally undeserved is bound to follow. In cases where negligence is proved the authorities are often not half

strict enough, but instead they wreak their vengeance in a totally unfair way by setting traps and catching the first individual who exceeds the limit, irrespective of there being any traffic on the road or not.

We know that carelessness on the part of some motor cyclists does exist; and we urge most strongly that the greatest care should be exercised at all dangerous points. Motor cyclists, particularly in London and other large cities, cannot be too careful. Now that change-speed machines have become general, a low gear should be always used at dangerous corners and cross-roads, which in many cases should be taken at an absolute crawl. All classes of vehicles, taxicabs particularly, turn out of street corners where least expected, and against one of these heavier vehicles a motor cycle stands a very poor chance. No less care should be taken at dangerous spots on open country roads, not only on account of oneself and one's own machine, but also for the sake of others.

While on this subject we should like to urge on all motor car drivers, amateur and professional, the importance of giving sidecarists as much room as possible. A sidecar is a pleasant vehicle to drive, except on heavily cambered roads; if the sidecarist be "bored" to the side, the sidecar wheel may hit the grass edging, when it is much more easily overturned than a four-wheeled vehicle of heavier construction.

## An Official Long Distance Sidecar Ride.

DURING the Show we had a talk with J. T. Gibbon, who recently accomplished the first A.C.U. observed trial on a  $3\frac{1}{2}$  h.p. motor cycle and sidecar. As announced in our last week's issue Gibbon started on Wednesday, November 20th, on a  $3\frac{1}{2}$  h.p. Alldays and sidecar, from the General Post Office, at 12.40 a.m., and proceeded to Great Yarmouth *via* Chelmsford, Colchester, Ipswich, and Lowestoft, and back *via* Norwich and Newmarket. Beyond lamp troubles the journey was covered without incident, and after covering 260 miles on the first day, he took a short rest and restarted at 7.30 a.m. The second day was covered without trouble. On the third day, which he started at 11 a.m., he had an excellent run to Yarmouth. But after reaching Norwich he experienced gear trouble, which, together with further lamp troubles, caused a serious delay, and were such as to prevent him obtaining any more sleep until the six days had expired. He duly arrived in London at 2 a.m. On the fourth day he started at 6 p.m., and shortly after he had to pull up so sharply at Stratford, when a motor omnibus turned round suddenly in front of him, that he pulled the back tyre off the rim. Owing to the appalling condition of the roads the machine was completely clogged with mud. Troubles were not done with, and at Brentwood the gear control quadrant broke and took ten hours to repair. Thereafter there ensued a good run to Yarmouth, but near that town the gear control rod stripped its thread and he drove on second speed into Norwich, where he arrived at 2.30 p.m.

### A new use for Sandwiches.

After effecting repairs he started at six o'clock the next morning. These repairs included straightening the spindle, filing the bronze discs in the clutch, and repairing or refitting control rod collar and clutch nipple. Four miles from the garage, after the restart, the clutch began slipping owing to the severe head wind and heavy roads. Near Newmarket Gibbon had again to stop, and took out the back wheel and adjusted the clutch in one hour. During the ride the roads were appalling, and although he wore two suits of overalls on more than one occasion he was completely wet through. The run was started with plenty of food on board, but the first night when Gibbon and the

observer felt the pangs of hunger it was found that the latter had been using the sandwiches as a footstool. Altogether in the six days during which he was running 1,076 miles were covered, and Gibbon only obtained fifteen hours' sleep.

We may mention that the gear, though of well-known make, was an old pattern. Only one adjustment was made to the engine, namely, the replacement of an exhaust valve.

J. T. Gibbon's ( $3\frac{1}{2}$  h.p. Alldays and sidecar.) This rider has lately accomplished an officially observed six days' ride. The machine just as it finished the ride was on the Alldays' stand.

# THE ALBION TWO-SPEED GEAR.

A Revolving Counter-shaft Gear giving a 40 % Reduction. Free Engine and Kick Starter included.

ONE of the neatest motor cycle gears which we have ever seen is the Albion two-speed counter-shaft gear, which Messrs. Harris and Sons, Ltd., of Upper Highgate Street, Birmingham, have just introduced. Originally intended for adaptation to low-powered light-weights, the gear has under test shown itself more than capable of doing all the work imposed upon it by a  $3\frac{1}{2}$  h.p. single-cylinder and sidecar. The gear has the important characteristic that it has no permanently fixed gear box, but instead the whole affair revolves in almost exactly the same manner as a hub gear. This, of course, constitutes a

Part section of the Albion gear.

very great advantage on ordinary counter-shaft gears, because in the Albion directly the top gear is engaged there are no gear wheels revolving, and the entire gear is running just as if it were a solid counter-shaft. Consequently there is the least possible loss of power. Further important points are the weight, namely, 7 lbs., which makes it probably the lightest two-speed gear on the market, and the price, which is so reasonable that anyone who can afford to motor cycle at all is well catered for.

## Belt and Chain Drive.

The *modus operandi* of the gear will be clear from the accompanying description and diagrammatic half-section. The engine drives through a short chain a large sprocket on the left-hand side of the device, and in order to avoid any possibility of confusion this sprocket and the part to which it is permanently fixed is shaded with a number of

dots. The sprocket is screwed on to a belled ring, the end of which is cut to form an internally toothed pinion. This meshes with a pinion, or rather a series of four planetary pinions (left unshaded), which are free to revolve on spindles supported by a second ring (shown black), which forms part and parcel of the gearshaft and the belt pulley flanges which are screwed on to it. The planet pinions also mesh with a sun pinion which is integral with a long hollow sleeve (shaded diagonally), which is provided with two squared portions adapted to carry the alternate plates of two quite distinct and independent multiple disc clutches. At the right-hand side of the gear is a bell-shaped body which is rigidly attached to the fixed spindle upon which the whole rotates. The function of the two clutches is to connect the sun pinion either to the outer shell or to the fixed spindle. In the latter case it will be seen that rotation of the chain sprocket causes the planet pinions to walk round the fixed sun pinion and carry their pin-spindles and the belt pulley with them; this gives a gear reduction of 40%. The low gear is put in by pushing the small plunger at the left-hand end of the spindle to the right. This forces the diagonally shaded cup against the plates of the right-hand clutch, and locks it accordingly to the hub spindle so that the sun pinion is held stationary.

## The Free Engine.

Free engine is obtained by sliding the small plunger slightly to the left and so disengaging the clutch. Top gear is actuated by a further movement in the same direction. This brings the diagonally shaded bell piece against the larger right hand clutch which engages with the clutch plates fixed to the black portion in the diagram. The whole gear is now locked up and runs solid. For sliding the plunger, which it will be observed works with a small ball bearing thrust collar, a quick thread thimble is used, whilst a double ended position pedal is used for the control of the gears. The larger size and number of the ball bearings upon which the Albion counter-shaft gear runs is clearly shown in the drawing, and is certainly notable.

## The Advantage of Correct Alignment of the Belt.

One of the great advantages of the gear will require no pointing out to the initiated, namely, that since both belt pulley flanges are screwed and held in position by lock nuts, the belt drive gear can easily be altered, and at the same time the belt line perfectly adjusted for alignment—a most important point if belt life is considered worthy of attention.

To make the gear quite complete a kick-starter is embodied and is arranged at the left hand end of the spindle. It is of the free-wheel type, in which the undercut teeth of the ratchet upon the starting chain sprocket are forced into engagement with the similar teeth upon the main engine chain sprocket by a small position cam which comes into action immediately the starting pedal is pushed down.

8 h.p. Matchless, with Gradua gear.

TWO OLYMPIA SHOW MODELS.

New Imperial twin-cylinder two-speed machine.

### A Spring Fork.

This fork has a compound action, enabling it to yield to shocks, both vertical and longitudinal. The fork girders A have built into them on either side a

modified form is described, in which blocks of rubber take the place of the springs C.—J. R. Hannam, No. 27, 1912.

### Silencing the Exhaust.

The exhaust gases pass along the pipe A into a chamber B of double ring formation giving a circulating motion to the

gases. The rings B are provided with slots C through which the gases escape.—H. Clarke, No. 12,647, 1912.

### An Exhaust Whistle.

In this device the pipe A is provided with a whistle orifice B, over which slides a sleeve C movable by a lever D against the action of a spring E. The lever D is pivoted at F, and engages the sleeve at G. Also upon the pivot F is a throttle disc H, which moves with the sleeve and partially closes the pipe A, deflecting the exhaust

gases on to the whistle orifices in the desired manner. The illustrations show the whistle in the open and closed positions respectively.—H. H. Lanman, No. 12,395, 1911.

### Front Mudguards.

The forward part A of the front mudguard has side pieces B which act as number plates. The portion A is easily

detachable, being provided with a box joint C as illustrated at the rear end and being held at the front by a spring stay D.—A. A. Scott, No. 22,695, 1911.

### Rear Springing.

The drawing illustrates the link system employed. It will be seen that the rear wheel spindle A is carried at the rearmost

point of the links, the weight of the main frame B being taken by the springs C.—L. Chambers, No. 27,980, 1911.

### Spring Footrests.

Each rest A is carried by a tube B surrounding a second tube C secured to the frame. Within the tube C are springs D and E, D normally taking the weight

and E taking the recoil. An abutment F carried by the tube B engages the springs D, E and prevents the rest A from twisting around the tube C.—S. J. Heaney, No. 4,980, 1912.

### A Frame Improvement.

To facilitate removal of the cylinder A, the lower horizontal frame member B which carries the tank C is made detachable. The tube is provided at either end with lugs of half circular form, engaging corresponding lugs D, E to which they are secured by bolts. By removal

of this tube and the tank carried by it, a clear space is left, enabling the cylinder to be lifted vertically clear of the piston.—C. T. B. Sangster, No. 25,566, 1911.

### A Three-speed Hub.

In this hub the high gear is direct, two reductions being provided through gear trains. The pinion carrier A carries three sets of pinions B, C, D. The pinions B engage on the one hand an annulus E, which carries the driving member of the hub, such as a pulley or chain sprocket, and on the other hand a sun pinion F, which can be slid to engage either a rotatable clutch member G, which engages with the annulus E, or fixed clutch dogs H on the wheel spindle. The pinion C engages a sun pinion J, which can be slid so as also to engage either teeth on the carrier A or another clutch member K fixed to the spindle, whilst the pinion D engages a further sun pinion L, carried by one member of a plate clutch device,

which operates in the usual manner to transmit the drive to the hub shell. The operation of the gear is effected through a sliding rod and key N, and for the direct drive the sun pinion F engages the rotatable clutch member G, and the pinion J engages the carrier A. Thus the mechanism rotates solid. For the first reduction the sun pinion F is moved to engage the fixed clutch H, being thus held stationary. The sun pinion J is still in engagement with the carrier A, so that the reduction is through one train of gears. For the low gear the pinion J is moved to engage the clutch K, and disengage the carrier A. The sun pinion F is still in engagement with the clutch H, so that both sun pinions are anchored, and all the pinions B, C, D free on their carrier. Consequently, a reduced drive through both gear trains is transmitted to the sun pinion L, plate clutch M, and hub shell.—A. H. Reilly, No. 28,925, 1911.

## SILENCER TOPICS.

THE recent outcry concerning the noise of motor cycles and the promised Local Government Board regulation will eventually lead to the really silent machine if rigorously observed. The causes which have made this step necessary are various. I think, in a measure, the T.T. races have had some influence. The T.T. races seem to have a bad effect on some of the younger and more foolish riders; they cannot ride in the races themselves, but must needs ride machines of the racing type which are supposed to give the general public impressions of untold power and speed, and make them admire and worship, in a manner only found in comic opera, the bravery and dare-devilry of the heroes who bestride them. I believe this rowdy section of the motor cycling world has been labelled the "K-nut," and in some mysterious manner the word at once describes the breed. The particular feature of the K-nasty K-nut seems to be an inordinate love for a K-noisy machine; it always opens its cut-out if going through a busy city thoroughfare. Even as I write one goes by riding a twin, very noisy, and not in very good tune. This, I may say, is another peculiarity; it cannot keep an engine in tune for—I was almost going to say knuts. These gentlemen (?) are indirectly those whom we have to thank for the recent outcry, I think.

### Silencer Construction.

The question arises, are manufacturers on the right track as they at present construct silencers? It is hard to say. The general rule is to follow car practice, but are there many really silent cars on the road to-day? The big four and six-cylinder cars are the quietest, but their quietness is nothing like silence—it is a continuity of noise which gives us the impression of comparative quietness. Notice one of these cars when it is misfiring. It is not often one hears such a thing, but perhaps a friendly car owner will short-circuit a plug or two if very nicely asked. If he will so oblige he will probably be very much surprised himself at the noise his pet engine is capable of. The noise is no greater than when running properly—rather less—but, being intermittent, it is much more apparent to the human ear. Consider also the small one and two cylinder cars; they are not so quiet as their bigger brothers. This is not a theory of my own, but is now generally recognised by those who have studied the problem. The degree of quietness already reached on large cars is quite satisfactory—I have never heard one grumbled at yet—but to reach thus far on the motor cycle is going to take some doing, with present methods at any rate. Having as a rule only one cylinder, the problem is correspondingly difficult, and we are also restricted as to the size of the silencer. A car, however small, has plenty of room for a very large silencer or series of silencers,

and it is in this manner that the problem has been treated in the car. Also on the car there is much more chance for the exhaust gases to cool down before discharging into the atmosphere, and it is the degree of cooling obtained that gives us the silence. Turning our attention more particularly to motor cycles, let us glance at some of the quietest machines we have on the road to-day.

### Some Silent Machines.

Very few singles are anything like quiet, but some of the  $3\frac{1}{2}$  h.p. Humbers and Rovers run as quietly as any I know. If we look at them, we find that a large silencer is used for the size of the engine compared with other  $3\frac{1}{2}$  h.p. single cylinders. Of the twins, the Clyno could travel far before it met a quieter machine than itself, and here again is car practice, a fairly large silencer and a pipe leading aft, with the result that the exhaust is very cool when it leaves the pipe. Of the lightweighters, we must give the Enfield the palm. It is always a source of wonder to me how such a tiny silencer can do so well. A machine which I must mention is the Scott; with its two two-stroke cylinders we get quite the effect of a four-cylinder car, and it is wonderfully quiet. The same is true of the four-cylinder F.N.

### The Principle of Expansion.

One principle which I should not be surprised to see partly adopted is this: when a gas under pressure is allowed to expand suddenly through a small orifice, a very rapid reduction in temperature takes place. This action is accumulative; that is to say, if the gases so cooled are allowed to escape round the outside of the pipe or vessel containing the hot gases, these hot gases are cooled a little, and the issuing gas becomes a little cooler still, and so it goes on, the issuing gas getting cooler and cooler. This principle is used commercially in the production of liquid air, and, as I have said, I should not be very surprised to hear of experiments being made in this direction. The difficulty will be, of course, to apply the principle without causing back pressure, and I confess I do not see how it could be done in its entirety, although it may be, and I think will be, partly used. If only the principle could be carried out as it stands! What a vista such a proposition opens up! Higher compression and hence greater efficiency, and yet no overheating and conking. No burnt valves, and yet perhaps we might have trouble in this direction, as the gases would be got rid of earlier, and therefore while hotter, but probably an auxiliary valve or extra cylinder ports would overcome the difficulty. All this, of course, is only conjecture, but the principle I have mentioned is sound, and has stood the test of commercial use. Perhaps my conjecture may be old and stale in a few months. Who knows?

A.G.D.C.

### Indian Expert in London.

Mr. Charles Gustafson, sen., chief of the experimental department of the Hendee Manufacturing Co., visited Olympia last week. He will also visit his Swedish home at a later date.

### A Successful Year.

The seventeenth annual report and accounts of the Self-sealing Rubber Co., Ltd., for the year ended August 31st last shows a total nett profit of £2,329 10s. 7d. A dividend of 10% and a bonus of 2½% free of income tax is recommended by the directors.

### Presentation to a Designer.

Mr. Cecil T. Bayliss, son of the director of the Perry Motor Co., Ltd., Tyseley, Birmingham, has been presented by Mr. J. Martyn Smith (the chairman) with a gold chronometer bearing the following inscription: "From the chairman of the Perry Motor Co., Ltd. (Mr. J. Martyn Smith), to Cecil T. Bayliss, age 20, the designer of the Perry motor car, November 25th, 1912." The chassis exhibited at the Show reflects the greatest credit on so youthful an engineer.

### J.A.P. Successes in 1912.

We have received from Messrs. J. A. Prestwich and Co. a list detailing the successes gained on J.A.P. motors during 1912. So numerous have been the successes of machines fitted with this engine that the booklet contains no fewer than fifty pages. From the summary of awards we observe that 259 firsts have been gained, 162 seconds, and 82 thirds. Surely this is an easy record!

### Insurance.

We have received particulars of the new A.C.U. unlimited policy for motor cyclists, which includes touring membership of the A.C.U. The premiums are now based on horse-power only, and run from £2 5s. for a machine not exceeding 3 h.p. to £3 10s. for a machine not exceeding 8 h.p. The premiums quoted here cover all indemnities, including sidecar. Cyclecars can be insured by payment of 50% extra of the premium charged for motor cycles; 25% extra is charged if the machine be used for business purposes. Continental risks can be covered by payment of an extra 25%, provided the insured pays the first £0s. of any claim arising on the Continent.

### Catalogues Received.

We are in receipt of the latest catalogues of Messrs. Chater-Lea, Ltd., 74 84, Banner Street (Golden Lane), E.C. Of these, one refers to the Chater-Lea cyclecar. The other catalogue is that of the Chater-Lea No. 7 sidecar combination, which is so well-known that only a passing reference is needed. The catalogue is well got up and deals in detail with this interesting machine.

Harrods, Ltd., Brompton Road, S.W., have published a most interesting catalogue of cyclecars for 1913. In this particular catalogue no fewer than seventeen different machines are described and illustrated. The details and information given are the fullest possible. Anyone anticipating the purchase of a passenger motor cycle vehicle should make a point of studying this catalogue.

## SPARKLETS

Readers who are interested in carburation should not fail to obtain the latest booklet of the Senspray carburetter, issued by C. H. Pugh, Ltd., Whitworth Works, Birmingham. This is an excellently got up booklet, describing the action of the Senspray principle. It is illustrated with sectional, line, and half-tone illustrations.

"Rudge Motor Bicycles" is the title of the 1913 Rudge-Whitworth motor cycle catalogue. This contains illustrations and specifications of the complete machines, a list of 1912 successes, also particulars and illustrations of some of the constructional details of the Rudge

New design quickly detachable sidecar clips.

engine, multi gear and other parts. A page is devoted to handle-bar patterns. The handle-bars are shown in plan and elevation, so that when specifying a machine a handlebar can be ordered to suit any particular requirements. Spare parts are illustrated by line sketches, each part having price and specification number under it. There are also several pages devoted to moderately priced accessories suitable for these machines.

Valve side of the new 2½ h.p. single-cylinder Villiers engine and change-speed gear, showing timing gear which is on the left hand.

The catalogue of the Connaught two stroke motor cycle has just reached us. The machine is made by the Bordesley Eng. Co., Ltd., New Bond Street, Birmingham. The machine created quite a favourable impression at the Show, and those who failed to obtain a catalogue there will be able to do so if they write to the firm direct.

### Business Announcement.

A report of the annual meeting of the Armstrong Three Speed Gear Co., Ltd., has just reached us. The 1912 profits will produce a dividend of twelve and a half per cent. on the ordinary shares, and sufficient has been carried forward to pay a further dividend of ten per cent. and to write off debit balance from the previous year in addition to providing for all charges and current expenses. The capacity of the works is 15,000 motor cycle hub gears per annum.

B. Alan Hill advises us that he will not after all be connected with the firm of Parsons and Hill, Romford, but will carry on business on his own account at the Woodford Wells Motor Works, Essex.

### Cyclecars.

A firm which has been making steady progress in the building of cyclecars is A. W. Wall, Ltd., Hay Mills, Birmingham. This firm has found markets for its machines in several foreign countries and the colonies. The Wall tri-carriage is fitted with a sociable two-seated body, and was on view at the Show. Incidentally, the increased output has justified the firm in marketing its 1913 models at somewhat lower prices, a policy which cannot fail further to increase their popularity.

### Shameful Treatment.

Can readers wonder that garage proprietors and others are not always ready to open at unearthly hours in the morning to supply petrol? F. E. Bailey, of 22a, Stanstead Road, Forest Hill, S.E., informs us that a person rang him up at 1.30 a.m. on the 22nd ult. and asked for petrol, and explained the tank had run dry fifty yards away from the shop. He was given two gallons with which to replenish and said he would return, but neither rider nor can was seen again by Mr. Bailey.

# REX-JAP

**"The Proved Best Sidecar Machine."**

The REX-J.A.P. throughout has been "*Built to an Ideal, not to a Price,*" and, owing to its unfailing reliability and consequently low cost of upkeep, it will be more economical in the end than a machine with a lower first cost.

# SELFRIDGE'S

Will supply the Motor Cyclist with all his Accessories at the lowest possible prices. Good quality always.

Write for Is the "Agros" Motor Cycle Suit in your Outfit?

Suits sent on approval

The "Agros" Motor Cycle Suit (as illustrated) is made from our well-known "Agrosette" cloth, and is porous yet waterproof.

No rubber is used in the manufacture of this suit. It is made easy fitting, and the wearer is doubly protected from cold winds, etc., by having a large underflap neatly arranged in front of jacket. This underflap is invisible. The jacket is lined with warm fleece and is of an extra length to give good protection on the saddle.

This Overall is not seatless, but made on the principle of trousers, here again giving extra protection on the saddle.

It is made with inverted pleats at the sides, has strong leather straps to fasten under the boots, and is finished with a belt round the waist.

It is an admirable suit, and much in demand by Motor Cyclists.

All sizes, 75/-

A Cheaper quality Weatherproof, 60/-

SELFRIDGE & CO., LTD., OXFORD STREET, W.

The Motor Cyclists' Cap

This Cap is exceedingly suitable for the Motor Cyclist, inasmuch as it can be worn either as an ordinary cap, or as shown in the illustration.

It is designed with a specially made elastic round the bottom part, which can be tightened or made loose at will. Another special feature is that it is absolutely waterproof, and about the lightest cap made. Our price 6/6.

Motor Cycles and Sidecars.

We are now prepared to sell nearly every make of Motor Cycle and Sidecar on EASY TERMS OF DEFERRED PAYMENT.

We invite you to call and inspect our representative stock of Motor Cycles and choose yours. In the majority of makes we charge only 2½% on the balance after deposit has been paid.

As we are now booking orders for the 1913 season, you will benefit by making early application.

# ROBERTSONS

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

ADVERTISEMENTS in these columns—First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To insure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

### SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

### SECTION II.

York and Lancashire.

### SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

### SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

### SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

### SECTION VI.

Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembrokeshire.

### SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

### SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

### SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

### SECTION X.

Scotland.

### SECTION XI.

Ireland and Isle of Man.

FOR SATISFACTORY  
MACHINES AT  
SATISFACTORY  
PRICES

CANNOT BE  
BEATEN.

Whether you are looking for the latest and best Models of the most famous Motor Cycles, the smartest introductions in Sidecars of the newest patterns for the 1913 Season, or some of the most interesting Cyclecars which were such an attractive feature of the Olympia Show

YOU CAN GET THEM  
ALL AT WAUCHOPE'S.

If you want 1912 Models, new or second-hand, or only slightly used, and in practically new condition, at most advantageous prices in the trade

YOU CAN GET THEM  
ALL AT WAUCHOPE'S.

Or should you be looking for a second-hand Motor Bicycle, thoroughly sound and satisfactory in every detail, overhauled, renovated, and repaired, ready for the road, just make up your mind as to the particular manufacture you would prefer, and call and make your selection, for

YOU CAN GET THEM  
ALL AT WAUCHOPE'S.

We hold the largest stock of Motor Cycles, Sidecars and Cyclecars in the Trade, comprising an immense variety of 1913, 1912, and new and second-hand machines of every make, all in the most satisfactory condition guaranteed, and certain to give satisfactory service. All machines offered at prices that cannot be beaten for value—the most satisfactory bargains in the trade.

ASK FOR LIST AND BOOKLET.

**WAUCHOPE'S**  
9, Shoe Lane Fleet Street,  
LONDON, E.C.

'Phone: Holborn 5777.  
Wires: "Opifcer, London."

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" C. When this is desired, 2d. will be charged for registration and three stamped and addressed envelopes must be provided for forwarding replies. Only the number will appear on the advertisement. Replies should be addressed, "000, c/o 'The Motor Cycle,' Coventry"; or if "Local" is added to the address, then to the number given, "The Motor Cycle," 20, Tudor Street, E.C.

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown parties may deal in perfect safety by availing themselves of the Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of goods is three days, and if a sale is effected we remit amount to the seller, but if not we return the amount to the depositor, and each party to the transaction carries one way. For all transactions exceeding £1 value, a deposit fee of 2s. 6d. is charged, when under £1 the fee is 1s. All deposit matters are dealt with by "The Motor Cycle," Coventry, and cheques and money orders should be made payable to Little & Sons Limited.

## SPECIAL NOTE.

Readers who reply to advertisements and receive answer to their enquiries are requested to regard this as an indication that the goods advertised have already been disposed of. Advertisers often receive many enquiries that it is quite impossible to reply to one by post.

## MOTOR BICYCLES FOR SALE.

### SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

3 1/2 h.p. for sale, 2-speed, free engine, like new; 2 years' use, offer refused.—Fish Shop, Ship Rd., Blaydon-on-Tyne. [X37]

TRIUMPH, 1912, F.E., new last June, been fully used and condition guaranteed as new; 2—Avery, Wetheral, Carlisle. [X37]

DOUGLAS, Xmas, 1910, excellent running order, tyres practically new, replete, all accessories; 2—Smith, 51, Victoria Rd., Darlington. [X37]

1913 Douglas Zenith, New Hudson, Rover, Smith Precision motors—send orders now for early delivery.—C. W. Smith, Northgate, Darlington. [X37]

2 1/2 h.p. 1912 Model, forced induction, Amag & Co. 22 trolled mag., automatic and pump lubricated, adjustable pulley; £25; buying car.—Cotton, 14, Barnard St., Sunderland. [X37]

1912 Zenith, 5-6 h.p., excellent condition, with large Lucas lamp, spare belt and tube and belt can new heavy Kempsall on back; £52, or nearest offer. Wilson, 39, Stanhope Rd., Darlington. [X37]

INDIAN, 1912, 7 h.p., free engine, only done 2,000 miles, original tyres still fitted, enamel and plating perfect; price £42, complete with lamp, horn, etc.—Forster, Douglas Crescent, Bishop Auckland. [X37]

### SECTION II.

York and Lancashire.

L.

HITCHINGS', Ltd.,

LIVERPOOL, 74, Bold St.

TRIUMPH, Matchless, and James motor cycles, and Swift cyclecars; sole agents; courteous service and absolute satisfaction guaranteed. Your enquiry invited by Hitchings', Ltd., 74, Bold St., the pioneers of motor cycling in the north. (Established 55 years ago. No connection with any other firm.) [X17]

6 h.p. Matchless, speedometer, F.R.S. lamp and horn 248.

3 1/2 h.p. Triumph, F.E., speedometer, lamp, and horn 244.

2 1/2 h.p. Singer; £35.

ALL 1912, condition as new; nearest offers.

MUST Sell to make room for 1913 models; Triumph already being booked.

HICKS, Motor Works, Sherburn, York. [X766]

3 1/2 h.p. Bradbury, good condition, powerful, good tyres; trial; £23.—G. Barker, Grassington, Skipton. [X322]

## The Paris Show.

THE Paris Salon, which opened its doors on Saturday last, was rather disappointing from a motor cyclist's point of view. This was partly due to the fact that the largest French firms making motor cycles had signed a bond not to exhibit this year. When we say that the names of such well-known firms as Clement-Gladiator, Peugeot, Alcyon, Clifton, and La Française were not in evidence, it will be understood that the Show was by no means representative. The absence of these firms does not allow us to criticise the whole of the French motor cycle industry, but those makes which were in evidence do not compare at all favourably with the British motor cycle exhibits in the same exhibition, and no comparison whatever can be made between the Salon and Olympia. At the latter exhibition practically every stand was of interest, whereas at Paris the search for novelties of interest to motor cyclists was tedious in the extreme. There may be more motor cycles shown at the Petit Salon, which will open next Saturday, and probably there will be also some representative cycle cars there, but the Salon proper is practically devoid of cycle cars. Descriptions of those present would be only a repetition of the last few issues of *The Motor Cycle*, as all the principal French manufacturers have been dealt with in our pages.

French firms still devote more attention to the engines and power units of their machines than they do to detail work of frames and fittings, a failing they have always had. This may be partly due to the price question, as most French machines are lower priced than well-known British makes.

As a spectacle the French Salon is unequalled; it has always led in decorative effect, and the lighting of the interior and exterior of the building is a wonderful sight. We refer here to the main hall, which is given up wholly to motor car exhibits. This domination of the best positions by large motor car concerns of previous shows is what partly induced the large cycle makers to refrain from making any display at all this year. At the last Show motor cycles were relegated to an obscure corner, so this year many firms are absent altogether.

It is particularly gratifying to British makers to hear the opinion of some of the French exhibitors, who make no secret of the fact that they are modelling their 1913 machines on the lines of the best English designs.

British riders have shown the pre-eminence of our machines in open competitions held in France during this year, and it is no idle boast to say that, were it not for prohibitive tariffs which the French Government impose on all foreign made motor cycles, British motor cycle makers would be able to do a very large amount of business during the next year or so. French riders recognise the reliable quality and easy control of our best motor cycles and covet them, but the business to be done is comparatively small owing to tariff walls. A first-class French machine can be obtained at about £10 less than a best grade British mount when duty, freight, and other charges are added. During our visit to Paris for the Show we did not see one single motor bicycle being ridden in the streets of Paris or in the vicinity of the Salon, and only a few cycle cars were in evidence—a contrast to the conditions prevailing at home.

## The High Price of Petrol.

THE meeting convened by the Royal Automobile Club to enquire into the cause of the unduly high price of petrol, and to discuss the possibilities of permanently reducing this price, showed that there was no real reason why the price should be so high. It is, of course, much easier to decide that the price is too high than to discover any practical means of reducing it. It has been suggested in *The Autocar* that the R.A.C. and the A.A. and M.U. should combine to buy petrol in bulk, as is done by the great omnibus and cab companies, at a reasonable price and retail it to their members. The difficulties of such a scheme seem to be that a large amount of capital would be locked up in it which could be usefully employed in other directions, and that very complicated arrangements would be necessary to cope with the distribution, as depots would have to be established all over the country.

The great petrol companies seem to think that they are justified in obtaining as large a profit as possible, and as the petrol trade is in the hands of three companies only, it does not seem probable that competition between them will result in any very considerable reduction of price, if any at all.

The necessity of a home-made fuel becomes more and more apparent, and it seems evident that the time has arrived for a reconsideration of the heavy tax on alcohol for industrial purposes and the further experimenting with such fuels as benzol.

# Decorated Sidecars at a Fête

AT A HOSPITAL FETE IN CAPE TOWN LAST MONTH ONE OF THE GREATEST ATTRACTIONS WAS THE COMPETITION FOR DECORATED MOTOR CYCLES.

Our photographs show:

- (1) The winner, B. Spilhans (6 h.p. Enfield).
- (2) M. Crenery (3½ h.p. P. & M).
- (3) F. Barling (6 h.p. Enfield).

## London Gloucester Run.

On Boxing Day the N.-W. London M.C.C. will hold an open winter run to Gloucester and back, starting from Jack Straw's Castle, Hampstead. The route will be *via* Watford, Wendover, up undeclared hill in Risborough district, Dashwood, Cirencester. Return *via* Birdlip, and then same route as outward journey, climbing undeclared hill in Aston Rowant district. Distance about 235 miles. To qualify for a silver cup a competitor must on the outward journey (a) climb Aston Hill, the undeclared hill, and Dashwood Hill at the first attempt; (b) make a non-stop run from the start to top of Aston Hill; (c) lose not more than ten marks. On the return journey, (a) climb Birdlip Hill and the undeclared hill at the first attempt; (b) make a non-stop run from Gloucester to Cirencester; (c) lose not more than ten marks. The trials sec. is Mr. H. E. Taylor, 17, Taviton Street, Gordon Square, W.C.

## OCCASIONAL COMMENTS.

By "IXION."

**Show Hustling.**

Though the crowds at the Olympia Motor Cycle Show did not quite equal those at the car exhibition, the hustling rendered a close inspection of the more popular exhibits a very difficult business. It is eminently desirable that on one day at least of the next Show admission should be limited to people who are more or less potential buyers. This should be easy to arrange, if the promoters would limit admission to a midweek date to persons holding membership tickets of recognised motor cycle clubs, who might pay an increased entrance fee in return for the privilege.

I set aside one afternoon for a precise study of several original mounts which I had not previously been able to overhaul as closely as I wished, but the crowd made it practically impossible to scrutinise them at all in detail. Finally, in sheer despair I wandered up into the gallery: and there the squashes were even worse. The narrow gangways will not hold the crowd of stand devotees and a double stream of pambulating enthusiasts.

**Wanted, Better Springing.**

The real disappointment of the Show was the closeness with which designers treat the springing problem. The last few years have been practically barren in this most important respect. I admit that the problem is difficult, but when we consider the number of first-class brains connected with the industry, the lack of originality in this respect is little short of amazing. Springing has to be cheap to manufacture, neat of aspect, and to possess such lateral rigidity that it will not interfere with balance. If I can assure the trade that the motor bicycle can never attain its full popularity until it is better insulated from road shocks.

Extensions of the market must include a majority of weakly and elderly individuals. These recruits will desire to ride moderately lengthy distances; and they cannot do it on the existing rigid frames, on which the main dithers and jerks are only modified by springing the front wheel and using spring-suspended saddles. The ache across the wrists, the ache across the back, and a weariness at nightfall are all inseparable concomitants of a prolonged ride for many men over forty years of age on existing machines.

If we were certain that motor cycle makers were honestly devoting their best energies to the problem, we would hold our tongues and make the best of things. That may be true of the American industry (where the roads are worse), but it is not true of ours. The average British manufacturer knows he can sell many machines as he can make, and he devotes himself somewhat cynically to perfecting his present design, as if any departure from it must spell bankruptcy.

In a year or two, when established makers are fighting hard for a slice of the steady, week-in, week-out supply, those makers who—other things being equal—supply the best springing will have a gigantic scoop. Surely every maker might make a beginning by insulating the saddle-pillar from the rigid frame?

Surely every maker might set one man to experiment with a rear spring fork? Are the possibilities of air springs exhausted? Would not bigger tyres pay on the "cob" types of machine, at any rate? Will some large firm of reputation take up the matter seriously and be for ever after blessed by motor cyclists generally? Even the most rabid and youthful scorcher would thank them, for he would be able to travel faster with less fatigue.

**Cleaning and Springing.**

I could only reflect sadly that if a tithe of the ingenuity shown in carburetter and engine production had been devoted to springing and to making a machine rust and mudproof, motor bicycles would be far more suitable for all-the-year-round road work than they are. The real fact is that the racing factors have dominated the industry during the last two years; the track and the hill-climb have been the two features on which most makers have glued their eyes. The industry and the pastime could do with a rest from all speed work for twelve months.

The healthiest object lesson any manufacturer could have to-day would be a *clientèle* consisting exclusively of very dropsical elderly men whose anatomies were excessively tender, whose business compelled a daily journey of a prolonged character, and whose temperament forbade them either to ride a rigid or shabby machine, and to clean it themselves. If I were a petrol king or a Rothschild I would unearth 5,000 individuals answering this description, and provide them each with motor bicycles drawn from ten leading factories. Their vitriolic correspondence with the makers and in *The Motor Cycle* during the next twelve months would procure sundry urgently needed reforms.

Mrs. S. Robinson, an enthusiastic Northamptonshire motor cyclist who, a month or two ago, completed a 700 mile tour alone to Scotland and back on a lightweight fitted with a 2½ h.p. J.A.P. engine. The machine is fitted with an Armstrong three-speed gear and is efficiently dress-guarded. 100 m.p.g. is the average consumption.

# THE CONNAUGHT TWO-STROKE.

Two-stroke engine details are always interesting, and we are now enabled to publish a detailed description of the Connaught single-cylinder engine made by the Bordesley Engineering Co., Ltd., Birmingham, and shown on the stand of

the Service Co. at the Olympia Motor Cycle Show. The cylinder is of the three-port type, and one of the most notable points is that the ports are situated only in the front and rear walls, so that the side pressure of the piston, due to the angularity of the connecting rod, is utilised to keep the piston tight over the ports in spite of any wear. To this end the inlet and exhaust ports are arranged one immediately over the other, and this is shown clearly in the appended diagrammatic section

Fig. 1.—Elevation and plan section of the Connaught engine.

tion of the complete engine. The piston is shown nearing the bottom of the stroke, having already opened the exhaust port A. A second port B, which acts as a transfer port in conjunction with the third port C, has also been opened by means of a port which is cut in the wall of the piston.

The vacuum or suction in the crank case induces the fresh gas, and this occurs when the piston rises and uncovers the inlet port D, thus bringing the carburettor into communication with the crank case. Immediately the piston descends on the power stroke, the inlet port is closed.

Fig. 2.

Fig. 3.—Connaught cylinder, showing exhaust pipe and compression release.

It will be at once realised that a great benefit accrues from the close juxtaposition of the inlet and exhaust ports, which are, in fact, contained in the same box cast on to the side of the cylinder, since the cool incoming gas tends to keep the temperature down in the neighbourhood of the exhaust. It will be noticed that the piston is furnished with the

Fig. 4.—The special crankshaft bearing and hardened steel ring to render the crank chamber gas tight.

usual deflector head, which extends semi-circularly round the piston as indicated. The sketch also shows the extreme width of the ports, this giving a very rapid cut-off, and at the same time providing very large apertures for the gas to pass through.

The second illustration shows how the ports are arranged so as to lie close underneath one another, whilst the third sketch shows clearly the cylinder and port box, and the attachment of the exhaust pipe, the inlet pipe being placed at the side. From this sketch it will be noticed that the sparking plug is placed in the centre of the cylinder head, and that the compression release valve, which is operated by a Bowden lever from the handle-bar, is at the side.

Fig. 5.—The oil measure for lubrication.

by a circle of small springs let into the crank webs. A large outside flywheel is fitted, and enables the engine to revolve at very slow speeds. The method of lubrication adopted is simplicity itself, and follows the practice which has now become standard on two-stroke engines in the United States, viz., the admixture of a suitable quantity of oil with the petrol. The oil is kept in a separate compartment of the petrol tank, and the correct quantity is measured into the petrol

when the latter is replenished, with aid of a small cup, which is screwed to a specially made tap on the oil (see sketch). The proportion of oil is one-sixteenth of a pint to every gallon of petrol. The cylinder is of cast iron.

## H. & B. GEAR.

The H. and B. gear remains the same all its essential features, in that it has only two gear wheels, the outer, which is internally cut, being mounted eccentrically and driving by means of crank levers. The expanding clutch, however, has been replaced by a cast iron clutch, which is operated by means

Hingston and Brown two-speed gear, manufactured by R. T. Shelley Ltd., with hub she removed showing new cone clutch.

a pair of cam faces. Another new feature lies in the belt rim, which is fixed to the driving portion by tubular spokes. The rim is held to the spokes by nuts, which screw on to lugs brazed to the rim. The gear has the merit of simplicity.

### Sectional elevation of the H. & B. gear.

## MUDGUARDING.

Devices for Mudproofing Rider and Machine.

LAST year I was permitted to air my grievances on mudguarding in the pages of *The Motor Cycle*, and in the hope that they will be of interest to winter riders, I am venturing once more on a few remarks about the same subject. The notes from which this article is written were taken at the recent Olympia Motor Cycle Show, and, owing to the limited time and unlimited crowds, it is probable that I passed over more than one clever mudguarding device. If this is the case, I offer my apologies to the manufacturer of such device, and beg to point out that where I have mentioned the names of any firms, I have done so merely to give examples, and have not attempted to give a full list of machines fitted in any particular manner. First of all, the thanks of all of us who are mudpluggers, by inclination or

Quite a large number of firms were showing machines having front guards with side flaps extended for their whole length, and a few were shown with useful mud-splashes either attached to the lower extremity of the front guard or to the front wheel stand.

More attention has been given to the protection of the front wheel brake gear, but it is little short of marvellous how many machines there were in the Show fitted with side flaps to their front guards and stopped off just behind the spring forks. Thus the springs and shackles constantly need cleaning and the brake gear jams, necessitating a dismount after every few applications of the front brake, to free the shoes from the rim.

It is true that certain types of fork carry their springs above the guard, where they are in little need of protection, but this is no excuse for not properly protecting the rider.

A good front guard should have side flaps for its entire length. These should increase in depth as they approach the bottom of the guard, and should also be somewhat splayed outwards, a large mud splasher being fitted at the bottom. The guard should also extend forward at least as far as the outside of the wheel rim. Even this does not fully protect a sidecar passenger from mud thrown by the wheel.

### Protecting the Belt.

Turning to rear guards and belt guards, things are disappointingly unaltered, and were it not for the ray of hope which emanates from such far-sighted firms as the Rex, Bradbury, Rex-Jap, and New Hudson, the outlook would, indeed, be misty. All these firms have paid attention to the belt-guarding question, and though I am an enthusiastic

supporter of belt drive (for solo work at any rate), I fully realise its shortcomings as a winter transmission. During the past year, however, I have been riding a machine fitted with a special belt guard, and although the driving pulley was a very small one, no signs of slip have been noticeable even in the worst weather.

A good front mudguard should extend at least as far forward as the wheel rim and have wide side wings and a mud splasher.

This proves that a belt can be properly guarded, and there is no possible doubt that the subject should be at once taken up by the manufacturer. Several firms are fitting guards round the engine pulley, and amongst the neatest is the aluminium casting on the Premier. This machine also has the distinction of being fitted with what is probably the widest rear guard on the market. It is of the domed type and measures approximately 7in. across the chord.

Failing a complete belt guard such as is fitted by the firms previously mentioned, why, oh why, does the manufacturer finish off his rear guards just at the very worst point, i.e., just above the bottom length of belt? When finished in this place, all the mud and water

Showing how rear guard on belt driven machines should extend below the belt and when possible inside the belt rim.

necessity, are due to the manufacturer not giving us better front mudguards. There are many really fine examples of front wheel guarding, among which the wide side wings fitted to the Douglas, Etti, and Williamson machines deserve special notice.

### Widely-spread Front Guards.

I have heard it said that they are both unsightly and wind jammers, but I cannot agree with either of these statements. In the first place, people are much too apt to label anything they are not used to as unsightly, and, in the second, the guards are no wider than the rider's legs which they protect. In any case they are well worth the fitting, for they will save not only the rider and working parts, but also the enamel, and thus the machine will retain its smart appearance for a longer period.

The writer's notion of a weather-proof machine. It has an all-black finish and guards as described in the accompanying article.

### Mudguarding.—

picked up by the rear tyre is flung round the guard and on to the belt in a continuous stream. The correct way to protect the belt is to continue the guard to a point just below the belt, and to fit a side flap from the guard to just inside

Holt's trouser guard, for which the Service Co. are agents.

the belt rim (as shown in accompanying sketch). In the case of a fixed geared machine it is impossible to bring the flap so near the centre, but it will be found quite efficient if brought to within  $\frac{1}{2}$  in. of the belt rim. This remark applies equally to machines having a countershaft gear with a belt as a secondary means of transmission.

The usual extension over the belt and brake rims, and even side flaps carried right round, unless brought round to the points above mentioned, do not save the belt, though they protect the rider, and for this purpose are admirable. The Humber and Centaur Co.'s fit a neat guard of the latter type, and as it is brought very close to the belt rim it probably protects the belt to a limited degree, but not sufficiently for real mud-plugging. On reading the above remarks, I can almost hear chain drive enthusiasts chuckle, but after riding a chain-driven machine hard for a considerable period I have a few remarks to make on this subject also.

### The Guarding of Chains.

Chain guarding appears to have received a great deal of attention during the year—a fact which no doubt accounts chiefly for the growing popularity of this type of drive. The A.J.S., Sunbeam, Clyno, and Lea-Francis are fine examples of how guarding should be carried out, and deserve much praise for their ingenuity.

The first point to be mentioned against entirely enclosed chain drive is usually inaccessibility, but with the coming of detachable wheels this point is easily disposed of, and a little thought has rendered the machines with fixed wheels at least as accessible as belt-driven machines with hub gears. Unless, however, the chains are enclosed, mud and grit soon ruin them, and also the sprockets, necessitating constant adjustment and spoiling the pitch, with consequent noise and loss of efficiency. It is possible to run exposed chains over dry roads for quite long periods without any very serious effects, but even then any grease or oil on the chains immediately collects dust and forms an excellent grinding paste.

Judging from the progress made during the past year, I am tempted to repeat more emphatically than last

year that absolutely oil-tight chain cases could be fitted which would not interfere with accessibility, and chains running in oil in combination with a good spring drive or slipping clutch should form an almost ideal drive.

### Weather-proof Machines.

With the exception of three machines—the Scott, Swan, and Lea-Francis—I searched the Show in vain for an undershield, and yet I feel sure that anyone who has once tried a well carried out device of this kind would refuse to be without one. It saves the rider, the working parts, and the cleaning brush, and consequently, given an oil-tight engine, one can go out in any weather and return with a spotless crank case. The mud can easily be scraped off a smooth undershield, or even washed off with a hose.

While on the subject of weather-proofing, it is a welcome change to see so many all-black machines in the Show, but here again there are only a few instances in which it is carried far enough. With the possible exception of tank fittings, which are easily cleaned, there is no necessity for any plating on the machine at all, and if each manufacturer was to turn out one really all-black model, it seems certain that it would find a ready sale among the regular winter riders. I fear that there are only four or five machines in the Show which can claim to be really thoroughly weather-proof, and there are points even on these which are open to improvement.

Mudguarding of motor cycles is progressing, but progressing very slowly, and in the meantime it is well to remember that there are several firms of repute who make special devices which may be attached to almost any make of machine for the purpose of keeping it and its rider clean and dry.

These firms are too numerous to mention, and their goods are mostly too well-known to need it. Two devices, however, the efficiency of which the writer has personally tested, are the Miller mudshield and the College screen. In conclusion, motor cycle manufacturers have got to wake up and attend to their

weather-proofing, unless they wish to see their clients leaving them for the protection afforded by a cycle car. It was not my intention to mention this form of locomotion in this article, but cycle car manufacturers would do well to take note of the experience gained by car manufacturers, for there were several light three and four-wheelers at the Show fitted with guards which will vibrate off and give very little protection to the driver and passenger.

UNIQUE.

### A CLEAN DESIGN.

Mr. B. H. Davies's suggestions in our issue of December 5th have prompted a contributor to send us a suggested design (reproduced below) which embodies:

A two-cylinder water-cooled engine with valves on opposite sides and enclosed leads.

A three-speed gear box cast with the crank case, and the final drive by belt.

The machine is well mudguarded and has a smooth surface wherever possible

A "Semi" shield made by Beard-Brown & Co., Northampton.

Adjustable footrests are provided on the new Premier, the engine plates having three sets of holes to receive the footrest bar.

so that the whole may be swilled down.

The tank is cast with the frame lugs (which practice is used by a well-known American firm), and with it is cast a tool box.

The front forks have enclosed springs, and the magneto is placed high up behind the cylinders.

All frame tubes are straight and a large silencer occupies the space between the bevel box and the rear mudguard.

Disc wheels are shown.

The design is novel and should be particularly easy to keep clean.

A CLEAN DESIGN, PROMPTED BY A SUGGESTION IN THESE COLUMNS.

(See paragraph above.)

## PASSENGER MACHINES AT THE SHOW.

By "IXION."

I DID not consider that the average cycle car exhibit was too encouraging. Symptoms indicated that the boom had caught the bulk of the trade napping. Some of the exhibits had obviously never been on the road at all. A reluctance to exhibit naked chassis is not a good sign: on several stands coachwork was tightly bolted down to cover all the mechanism, and as the presence of the coachwork made important details inaccessible or even invisible, except by crawling underneath, obviously the coachwork was intended to limit inspection, or, alternatively, the whole machine was experimental.

One cycle car is said to have received its finishing coat of varnish in the railway van *en route* from the Midlands. Another had such tiny brakes that it plainly had not covered 500 miles. Others had very long chains, with rather crude and limited adjusters. In fact, quite a number of the newer cycle cars will need a great deal of re-designing before they can face a six days' trial.

The average three-wheeled chassis was well designed on the whole; the difficulties of obtaining an accessible back wheel has been admirably handled in most instances. The passenger market of 1913 will without doubt fall into the hands of the sidecar, the established 1911-12 cycle cars, and a few select representatives of the newly-designed cycle cars.

### Genuine Cycle Cars.

The genuine cycle car, as opposed to the miniature automobile de luxe, has scarcely come into existence. The Morgan chassis, weighing  $2\frac{1}{2}$  cwts., with an 8 h.p. engine, has few rivals either in lightness, price,

or general efficiency. Together with some of the belt-driven four-wheelers, it points to the ideal of a light machine, with air-cooled engine and simple transmission. If such a machine be eventually produced in quantities at a really low price, it will have a tremendous market, for it can compete with the sidecars. At present the lighter and simpler cycle cars are more costly than a typical sidecar outfit, and their road capabilities are comparatively unknown.

### Will Belt Drive Survive?

There is considerable controversy as to whether any belt drive is really desirable on cycle cars; and I should say that the Morgan transmission (bevel gear and two chains) and the A.C. all chain are the greatest arguments against the survival of the belt. If a rigid transmission be practicable on one of the lightest and cheapest machines now manufactured, the future of the belt is certainly problematical. On the other hand, big belts on big pulleys stand up excellently in sidecar work with medium-powered engines. Small belts and small pulleys are responsible for 95% of our belt troubles.

The advantages procurable in two-wheeler work by changing a 4in. for a 6in. pulley, and a  $\frac{3}{4}$ in. belt of inferior make for a 1in. belt

of good make are simply incredible; and I hope the lightweight enthusiasts will persevere with the belt for a year or two at least. The main merit of the belt is that it makes a large range of gear ratios possible on a light machine. A cheap chain-driven cycle car cannot very well have more than two speeds, or three at most; a cheap belt-driven one may easily have eight or nine.

The body width of cycle cars is an important point. In some designs the driver is placed slightly in front of the passenger to give more elbow room, as in the case of the Swift body illustrated. Observe the compartment behind the driver's seat.

### DETAILS OF THE RUDGE CYCLE CAR.

Rear springing, showing belt rim brake

The framework and front springing.

A useful tool-box is arranged at the back of the driver's seat.

### Passenger Machines at the Show.—

The New Hudson chassis is interesting in this connection. Presumably a four-speed epicyclic hub type of gear could be cheaply made, and with anti-shock devices incorporated, might stand up under chain drive. But we cannot expect a machined four-speed sliding gear on a low-priced model. The smaller the engine, the greater the number of gears desirable.

I still fancy that there are great possibilities in the direction of a medium sized air-cooled engine, with a transmission consisting of large belts running over large pulleys, and gearing composed either of expanding pulleys or epicyclic hubs, used as counter-shafts.

### Tandem and Sociable Seats.

It is obvious that the public do not like tandem seating. This prejudice will retard the advent of the light, cheap cycle car, for a broad two-seater is a great wind stopper, especially when it has a screen and hood, and power will have to be piled on to push these outfits in the teeth of a gale. Some of the makers narrow down their side-by-side seats to 34 in. or so: this will never do. Some of the miniature automobile-de-luxe types are wonderful value for the money, though I should not be surprised to see the prices rise as the models are perfected, and large deliveries commence.

On one single chassis I spotted eight points which struck me as urgently demanding alteration, and I was told that the price of that machine had already been raised three times since it was first planned. The pioneer cycle cars which possessed any refinement of design or fulness of specification have mostly been listed close up to small car prices.

### Notes on Trial Runs.

Trial runs in the Hammersmith district were very interesting. It was obvious that many of the new types were clamouring urgently for better balanced engines, more flexible carburetters, and improved

silencers. The 50° type of V engine, with small enclosed flywheels, cannot be run so slowly as a 90° twin with large outside flywheel; it is questionable whether the best carburetters can make such engines really pleasant when running light; and I expect to see them all gradually ousted by 90° twins or small *monobloc* four-cylinders, both with large outside flywheels; probably the former, since they will be cheaper and more efficient.

There are already one or two good engines on the market, with 90° cylinders and good sized outside flywheels; but there has not been time for their makers to give deliveries.

Where there is but a small reserve of power, the cross drives and shafts requisitioned by setting the crankshaft longitudinally with the frame are far from ideal; and if the crankshaft be set across, the chassis is too short; in one or two cases these engines were mounted on stubby chassis, and the rear cylinder was not specially accessible.

The commonest criticism of the demonstration machines outside the Show was that their engines were unpleasant when running free. I was agreeably surprised with the springing, which was much better than I had expected; but, of course, touring speeds were not attempted in the Kensington traffic. The next year will show a wholesale advance in design and construction.

### Sidecars.

Turning to the sidecar, which promises to enjoy the bulk of the passenger trade for at least another twelve months, we saw that practically every maker supplies a bicycle well adapted for pulling a sidecar. J. R. Haswell, Hugh Gibson, the Rev. P. W. Bischoff, and others have demonstrated that a skilfully handled 3½ h.p. change-speed bicycle is capable of hauling a passenger and sidecar round some of the most exacting routes in the British Isles; and from this we may make the obvious deduction that the average duffer may expect excellent results with similar outfits in ordinary country.

The 8 h.p. three-speeded type of sidecar hauler is now a luxury, rather than a necessity, provided one is content with a hoodless, screenless wicker chair. Of course, if a heavy coachbuilt sidecar with full automobile fittings be selected, the engine power should be in proportion.

Since tyre troubles are unduly prominent with such powerful outfits, the Clyno detachable wheels are ex-

Exhaust valve filter on the Day-Leeds four-wheeler.

Construction of the Clyno rear frame, with which is incorporated a platform for the gear box and magneto.

Vaned outside flywheel of the A.C. sociable to assist cooling.

THE RED *Indian* FOR 1913.

The machine that is different.

The INDIAN models for next season represent quite a new departure in motor cycle design and construction. Its numerous improvements and refinements, which will be found below, make the new models at once the most easy riding and the most trustworthy machines extant.

The Laminated Spring Frame—makes the 1913 INDIAN the most comfortable machine on the road.

The Improved Foot Starter—enables you to start easily and gradually without effort.

The Extra Heavy Rims and Tyres—ensuring great strength and increased comfort to the rider.

The New Silencer—most effective, can be used with end release open without offence.

The Roller Bearings in Connecting Rods—ensuring increased flexibility and silence.

Booklet of the Red INDIAN furnished on request.

## Passenger Machines at the Show.—

1win-cylinder All-ave-Matchless and Sydenham sidecar. The wheel springing and front fixing of the sidecar will be noticed.

ceptionally attractive; probably such wheels will eventually figure on all the heavy outfits; for motor cycle tyres are notoriously somewhat of a lottery on the big sidecar pullers, and though some of them emerge from 1,000 miles' trials without a tyre stop, they generally use much heavier and costlier tyres than a private owner cares to employ.

Some extraordinarily comfortable bodies were staged. It may be questioned whether any motor vehicle provides greater comfort than a good sidecar; vibration and bumps seem to be totally eliminated, and the only drawback is a gentle swinging sensation, due to the insulation of a feather-weight chair by large springs on a light chassis.

End view of F.N. two-speed gear on the 5 h.p. four-cylinder model.

cars: the exposure of the driver to wind, dirt, and vibration is its real demerit, partially balanced by the compensations of having two machines in one (when the sidecar is detachable). This demerit is sufficiently real to ensure an ultimate future for the cycle car so soon as it can actually compete with the sidecar outfit in price, economy, and reliability; but that day is not yet.

## Sidecar Attachments.

Other things being equal, it is a great advantage to own a motor bicycle which has brazed sidecar lugs. I fear I am rather a lurid driver at times, and I generally manage to shift my sidecar fixings by brilliant cornerwork; while novices encounter some trouble in adjusting the sidecar correctly; brazed lugs would be a help to us both.

The sidecar brake is attractive. We cannot use the bicycle front brake very ruthlessly, and the bicycle rear brake is apt to glaze on tours with a heavy load in hilly country. The only sidecar brake I ever used was a band brake, operated by a Bowden wire from the handle-bar, and quite uncompensated. I did not like it; but I shall watch with interest the type of double rear braking which is interconnected and compensated, such as the Rover. In its absence, most of us use throttle braking wherever possible, and so spare the belt-rim shoe.

I fancy two shoes on the rear wheel of the motor cycle, one inside and one outside the belt-rim, would be equally efficacious and perhaps a little cheaper.

The single belt drive will lose much ground among sidecar enthusiasts this year, although it is tolerably efficient. Some of the new three-speed hubs have a lower bottom ratio than in 1912, so that a 4½ in. or 5 in. pulley will permit of a double figure bottom gear with a big belt riding on the top of the engine pulley.

Front springing and cable steering on the G.N. runabout.

But there are attractive alternatives; in one line we have three-speed chain-drivers like the James and A.J.S. and powerful twin belt or chain drivers such as the Rex Sidette; in another, we have such combined drives as the New Hudson. It is an exaggeration to say that the secondary belt on a combined drive never slips. But beyond contradiction such belts run for several thousand miles with remarkably little attention, and will grip in pouring rain if they are tight, fairly well protected, and fit their pulleys. I have never known one absolutely refuse to haul on the most puddlesome flats or against a rainstorm on a hill—when conditions have often made me dismount with the single belt drive. In the heavier class we have such ideal sidecar outfits as the Clyno, Bat, Enfield, Williamson, etc. These will appeal very forcibly to riders who seldom think of detaching the sidecar, while the lighter machines are more attractive to men who more often use their machines for solo work.

6 h.p. twin-cylinder Rolfe sidecar machine, fitted with Precision engine, chain drive, and counter-shaft gear.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the "Editor, The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

#### Riding Hands Off.

Sir,—A rider of a racing Douglas (judging from its Brooklands crackle) was observed on Sunday morning, while passing through High Street, Bromley, Kent, at a comfortable pace, to place his hands simultaneously into his pocket, bringing forth matches and cigarettes, and then to light a cigarette and replace the before mentioned articles in his pockets without in the least disturbing himself or the control of his machine. This speaks well for the steadiness of the Douglas and the rider's skill, and he should next try Bromley High Street on a Wednesday evening, after early closing, when he will have an appreciative audience.

MYER B. LEE.

#### Mudguarding.

Sir,—On page 1391 you illustrate a belt guard as used on the Elswick. I fitted my  $3\frac{1}{2}$  h.p. two-speed Humber with a similar guard (but carried further back on the underside) three months ago, and find it very efficient.

I had an incident with this machine which I should like to relate for the benefit of fellow motorists. It is fitted with a Binks two-jet carburetter, and on going out one evening it was missing badly on the small jet. When throttle was opened wide enough to expose the large jet it ceased missing. Naturally I diagnosed the trouble as a partially choked jet. I took down the carburetter, but could find nothing wrong, still the missing continued. I then tried a new plug in which the spark gap was nearly  $\frac{1}{16}$  in., the missing ceased. I then opened out the points of old plug and the missing vanished. I remembered I had closed the point somewhat after my previous run, and, as I could see daylight between them, did not think it possibly could be the plug; thus it is, not an advantage to have the points very close.

TI 140.

#### Cycle Car Design.

Sir,—There is much to interest those of us who are keen on the cycle car in your recent issues, but there are one or two matters which I think can profitably be considered by your numerous readers.

Firstly, as regards the matter of the carriage springs for the cycle car, there is a notion abroad that springs are expensive. They are not. A set of four first-class springs for a cycle car I have built cost me one sovereign, and each spring is four feet long and quite flat when loaded. These are the fundamental conditions for smooth running and freedom from pitching and bumping so common in what pleases "Ixon" to call the genuine small car, which, as he says, cannot be run for  $4\frac{1}{2}$ d. per mile.

Again, weight is not a necessary condition for smooth running. Dead weight on tyres and harshness of drive, to say nothing of the careless use of the brakes, are the chief contributory causes of rapid tyre wear, and therefore expense, so I should strongly recommend those interested, whether professionally or otherwise, to see that the cycle car selected shall be economical as to tyres. There is no reason why a cycle car, a "genuine" one, with the drive divided between two wheels, and the weight nicely distributed between the four wheels, should not average quite 10,000 miles with good large motor cycle tyres.

There are other points, such as durability of engine, number of speeds, etc., that I should like to write on, but

I must content myself with a word of caution to the user and to the trade, that hasty rushing into the really new motoring will not be best for all concerned. There is no reason, however, that the co-operation of really skilled designers, with sound originality, based on a broad engineering experience, and capitalists, should not readily produce and sell with handsome profit four-wheel cycle cars, having ample engine power, four speeds and reverse, and differential gear, luxurious springing, and roomy two-seated body, side by side, for under the £100.

I sincerely hope that the genuine amateur will come forward and support the new "Cycle Car Club," so that the professional element will be quite in the minority.

A. E. PARNACOTT.

#### Silence.

Sir,—I shall be obliged if you will allow me a small space in your valuable paper to comment on the remarks of "Ixon" re the undesirability of a silent motor cycle in your previous issue. I have always read his excellent articles, and much appreciate the great influence they must have had on the trend of design of modern motor bicycles. I must, however, disagree with him on one point. He says: "I regard a really quiet motor bicycle as a public danger. An inaudible car is dangerous."

Now has he ever ridden a really quiet motor cycle and driven an inaudible car, or is his statement merely drawing a bow at a venture?

His argument against silence is an old one. It was held against the noisy boneshaker, and again against the Silent Knight engine when first used by the Daimler Co., yet somehow all these objections are never heard of now; for it is a curious thing, too, that ever since the advent of this engine manufacturers have endeavoured year by year to produce a more and more silent and smoother running car, and with never a protest from car owners and drivers, which would be strange if their cars were more dangerous to drive than noisy ones.

Ask anyone who drives a Silent Knight engine or rides a modern push-bicycle whether its silence is a danger, and he will say, quite the contrary—it is both safer to ride and drive than a noisy one.

Has "Ixon" ever ridden, say, a modern Scott machine? I have, and, in company with many other satisfied users of these machines, say it is even safer to use and less frightening for the pedestrian than the usual  $3\frac{1}{2}$  h.p. touring mount. I have never heard a word against its silence, except, perhaps, that it would be an improvement to make it even more quiet.

Of course, with a quiet machine as against a noisy one, one cannot blind through villages at full speed, trusting that the hideous noise produced will compel every other user of the roads to make way, but must simply slow down to a respectable speed of, say, 17-18 m.p.h., and give a warning, if required, by horn in a gentlemanly way; for as soon as the flashy bouncer or "Kuut" sees that he himself will be in danger when blinding through traffic on a silent machine he will slow down. Thus you will see that silence, far from having a bad effect, will automatically reduce speed through towns and villages, and will be as great a boon to the general public with motor bicycles as it has been with cars.

SILENTIUS THE SILENT.

## Before Olympia

we were convinced that the Victoria value would cause a mild sensation—and it did.

## After Olympia

we hold the proof, for motor cyclists far and wide have not only shown appreciation, but filled our order books with practical evidence thereof—and when you think of it—when you study the specification of the

# VICTORIA MOTOR BICYCLE

which is as under—

*Precision engine, single cylinder, 85 m/m, bore x 88 m/m stroke, with mechanically-operated side-by-side valves, and variable pulley; specially designed Druid patent girder spring forks; Bosch high-tension magneto; chain driven; Brown and Barlow carburetter, with handlebar control; Dunlop rubber belt; Dunlop heavy rubber-studded tyres; Brooks B170 saddle, and an exceptionally full equipment—*

When you know its price—£38—you, too, should be convinced.

Anyway, we're here to fill that purpose, and we ask you to let us tell you more about "Victoria" value—write us.

**Victoria Motor and Cycle Co., Ltd., Victoria Wks., Dennistoun, Glasgow.**

**Price £38 0 0 complete.**

# BROOKS SADDLES

That is the story in a nutshell, and—you can prove it on the open road. Everywhere you find the BROOKS—here and there the saddles with another name. And would that be so if the service were not best? And the secret is the spring—the BROOKS PATENT COMPOUND SPRING—the spring that makes the roughest road vibrationless! Do you know it? If not, ask us for the BROOKS BOOK.

**J. B. BROOKS  
& CO., LTD.,  
49, Criterion Works,  
BIRMINGHAM.**

*Note that a full range of the BROOKS Cycle and Motor Cycle Specialities may also be seen at our London Showrooms—  
Criterion House, 11, Grape Street Shaftesbury Avenue, W.C. (Oxford St. end.)*

# BEST SERVICE

# STURMEY-ARCHER

## 3-Speed & Free Engine Motor Cycle Gear.==

At Olympia the most popular variable gear was the 3-speed hub gear, seen on practically every maker's stand in the Show.

Experts declare that 80% of the 1913 Motor Cycles will be fitted with 3-speed gears. See that you get the BEST, the original Sturmev-Archer with direct drive on top gear. As fitted by the leading makers, Triumph, Humber, Bradbury, etc.

## A SELECTION OF LETTERS FROM OVERSEAS READERS.

Opening meet of motor cyclists of the Eastern Province, at Port Elizabeth, South Africa. Most of the machines are of British manufacture.

**The Sidecar in Tasmania.**

Sir,—Being a reader of your interesting journal, and one that has taken a keen interest in motor cycles for some years, I am forwarding a photograph of myself and family taken on my free engine Triumph and sidecar. This is a very hilly

C Jillett with his heavily loaded Triumph and sidecar. (See letter.)

country, and, considering our weight (26½ stones), the machine is really a marvel for power and reliability, and I cannot speak too highly of it. The three-speed gear will be a great boon. There is only one three-speed machine (a New Hudson) out here yet. Wishing your journal every success,

Hobart, Tasmania.

CECIL JILLETT.

**Riding Conditions near Port Elizabeth.**

Sir,—As probably one of the oldest motor cyclists in England, and having been in South Africa about eight months, perhaps a few words re the prospects of motor cycling here may be of interest.

I came out in December, 1911, with visions of terrible roads, impassable streams, hills which would surprise me, and therefore without a motor cycle, but after a few weeks found things locally not to be so bad as I expected, so invested in a B.S.A. single-gear (1911 late) machine, on which I have now done over 7,500 miles over all parts of the country.

The roads here are bad at times, only tracks with bad ruts, but do not let anyone think they are unrideable, for more pleasure I never had than in the last six months. I broke the cross country record to Grahamstown, a city ninety-six miles away, which I did in 3½ hours—surely sufficient in itself to prove machine, roads, and rider are in good order.

I have not yet met a hill which I could not easily surmount—in fact after three weeks solo riding I felt that a sidecar would improve the pleasure, so invested in a Montgomery, castor wheel, which has done me good service. With this combination I regularly average 20 to 25 m.p.h. over the local roads, and romp up hills not more than 1 in 8 with 12 stone passenger, and have managed our pet hill, Whites Road, average 1 in 6½, with a 10 stone 8 lb. passenger.

In short, South Africa offers pleasures equal to home for the motor cyclist, no police traps and no speed limits.

Port Elizabeth, South Africa.

J. W. BROWN.

**The Motor Cycle Going Ahead in New Zealand.**

Sir,—The photograph herewith may be of interest to readers of *The Motor Cycle*, which is looked forward to by motor cyclists here. The photograph shows the opening run of our local club, which has now forty members, and was promoted by myself. The favourite machines out here are the Rudge, Triumph, Bradbury, Indian, and the Douglas. The pastime is really booming just now, the trouble is to get deliveries. The 3½ h.p. is the most popular, and there is a fair demand for lightweights, but I am rather afraid that they will not come up to expectations, as some of their owners expect too much from them. They are driven fast over our rough roads, and if anything breaks their owners are the first to want to know the reason why.

Ferguson Street, Feilding, N.Z.

W. B. BENSON.

New Zealand motor cyclists assembled at Feilding, the event being the opening run of the newly formed Feilding M.C.C.

### Does an Engine Run Better at Night?

Sir,—A recent contributor to your columns puts the question, Does an engine run better at night? Now, I have frequently noticed that engines do run better at night, and they have been made to run equally well through the day by increasing the air supply. Sunshine through the day and chilliness at night is, in my opinion, very conducive to this condition, as the temperature being lower at night the air is much more dense, and, therefore, more of it enters through an orifice than would be the case through the day, therefore I do not doubt that an engine would run more uniformly if it were made possible for more air to enter the carburetter.

ALFRED RILEY.

### The Price of Motor Cycles.

Sir,—I was greatly impressed at the perfect truth of "Ixion's" article in your issue of November 28th with reference to the price of motor cycles. Like all other good motor cyclists I visited the Show and was struck with the wonderful glitter and finish, awfully high prices, and amazing inaccessibility of the majority of the machines staged.

I am getting about sick of paying anything between fifty to sixty-five guineas for a motor cycle, consequently I was greatly disappointed to notice the general rise in prices. Will no firm of assemblers or makers come forward and offer the public (and a huge number of the public at that) a thoroughly good 3½ h.p. single or twin, simple and reliable, at £30 to £35. Let us (the crowd) have a cheap and reliable machine and let the man with the long purse pay for racing track experience.

"Ixion's" reference to the influx of foreign machines is just true, and if the foreign motor cycle is as good as some of the foreign cars, well then good-bye to the motor cycle trade.

BUILDER.

### Territorial Motor Cyclists.

Sir,—I wish to draw your attention and that of your readers to the difference in treatment accorded to civilian and Territorial motor cyclists.

When it was first decided by the authorities to employ motor cyclists during the Army Manœuvres, I understand the scheme provided that the vacancies should be filled by members of the Territorial Force upon the following terms, viz., 8s. per diem for maintenance and insurance of motor cycle, and pay and messing in addition, amounting in the case of a private to 2s. per diem.

It was found desirable to enlist the services of civilians in addition, and application was made accordingly to the Automobile Association and Motor Union. The terms offered were as follows, viz., 8s. per diem for maintenance of machine and 8s. per diem subsistence allowance. This means that a civilian draws £2 16s. allowance per week as against 14s. by a Territorial soldier, and probably does not expend more than 25s.

The grievance, therefore, under which Territorial motor cyclists are suffering is that, although they have been trained in military duties, and hold in the majority of cases non-commissioned rank with attendant responsibilities, the value placed upon their services by the authorities is exactly one-quarter of that of civilians untrained in military duties.

In view of these facts, the authorities can hardly expect to retain the services of Territorial motor cyclists who have served under the existing conditions, unless the terms offered to Territorials and civilians are placed on an equal footing.

ONE WHO HAS BEEN BITTEN.

### Tyre Wear.

Sir,—Replying to "An Old Reader's" letter in *The Motor Cycle* of November 28th, I beg to state that I have given my close attention to this particular problem for the past two years and have conducted all manner of tests to fathom the undue wear taking place at the walls joining the beads. As the result of those tests, I found that the wear occurred through movement of the beads in the rim both laterally and in creeping, also when a sidecar is attached there is a severe twisting strain set up on the inner bead wall, the one nearest to the sidecar, which is increased considerably if there is not perfect alignment between the sidecar wheel and the motor cycle driving wheel, both horizontally and vertically. Then there is another factor, viz., thickness of beads. I personally have handled quantities of motor cycle covers of various manufacture, and some have

thick beads, some medium, others thin; most rims are standard in size at the edges of rim to take the bead. If that bead does not fill that space, movement occurs, especially if the tyre be a trifle under inflated, and the result is, through movement, the edge of rim cuts its way through rubber and canvas at that part in time. I can positively say that the wall joining the bead is the weakest part of a tyre, as at that part you get the join between the solid and stationary part and the flexible and moving part of tyre.

I have handled plenty of covers of various makes which have had splendid treads on them; in some cases one bead had parted in various places, and in some cases both beads had gone. I am pleased to say I have devised a means of preventing this chafing, but to all I would say keep your tyres hard.

WALTER MORRIS.

### Fair Treatment.

Sir,—With reference to the letters which have recently appeared in your excellent paper giving instances of the fair manner in which some motor cycle makers treat their customers, I should like to point out that such treatment is not common only to the makers of the actual machines themselves, but is shared by some of the accessory makers.

My experience, though not so striking perhaps as that of Rev. Douglas Hamilton, will bear testimony to the manner in which Messrs. C. H. Pugh, Ltd., makers of the Senspray carburetter, deal with complaints.

My carburetter, an early 1912 pattern, appeared to have one of two defects, causing, amongst other things, very high petrol consumption, so I wrote to Messrs. Pugh to ask their advice. Their reply was the immediate despatch of a "shop" carburetter for my use whilst they overhauled my instrument. Besides a complete overhaul, they brought my carburetter into line with their most recent model, for which they made no charge.

I trust that you will find space to print this letter, as I think such promptitude and consideration are deserving of a little publicity. I may add the usual disclaimer.

RALPH WADE.

### Shape of Combustion Chamber.

Sir,—We are informed that the spherical (is cylindrical meant?) combustion chamber is not suited to hill-climbing. Whatever does this mean? If, as the author asserts,

"... Every motor cyclist, even of the potter type, knows that the combustion chamber which approaches the sphere (again, cylinder?) most nearly in shape is the most efficient." Then why are we subjected to theoretical results which are attributable solely to the exterior surface of the combustion chamber itself? Making use of his system of logical deduction, cannot we say that if it takes a certain period of time for a given surface of metal, such as we have in the construction of cylinders for valves either side by side or on opposed sides, to get hot, that it will take a relatively shortened period of time for a smaller surface, such as is employed in the cylindrical combustion chamber having overhead valves to get cool? Here an advantage is derived, and, although without the adduced argument, it must be shown that we are not constantly hill-climbing. Therefore, the matter resolves itself into the question of cooling, and it must be conceded that properly cooled overhead valves should, theoretically, score a comparative advantage which it is to be hoped the 1913 season will cause attention and due consideration.

The presumed answer of the enthusiast for scavenging needs no comment. It is correct, and it should be further emphasised that all but a very small quantity of waste, exploded matter remains in the combustion head, whereas in the case of side by side or other valves the quantity is very considerably greater owing to the extra surface necessary as valve pockets at the very place where most heat is generated and retained, and where better cooling becomes a very valuable necessity.

Then, when the explosion takes place in the cylindrical chamber the whole power transmitted thereby is obtained exactly where it is required, on the piston head. Contrast this with an explosion which spends a really greater proportion of its energy than is usually imagined in the valve pockets, serving no useful purpose, but rather the contrary, and but one obvious answer is forthcoming. Was it not stated in the motor cycle press at the time of the last T.T.

races that the riders of Regal-Green machines (overhead valves and water-cooled) were miles an hour faster up hills than their *confrères*? And was it not stated in the same press that in the excessively arduous Six Days' Trials—a "trial" truly in more senses than one—an overhead-valved, water-cooled machine of only 499 c.c. went successfully over the course on a gear of  $4\frac{1}{2}$  to 1 when very many failed on higher powered machines geared much lower? [This statement did not appear in *The Motor Cycle*, and it is not true.—Ed.] What more, then, is required to show that a machine having the combustion chamber of its power unit as nearly true cylindrical as circumstances permit, plus efficient cooling, is at present equal to any other type of chamber at present in use? Is this due to overhead valves or to the cooling system? To the happy combination of both I would reply.

KULINDOS.

Sir,—With reference to an article in *The Motor Cycle* of November 21st, entitled "A Few Points Simply Explained," signed by "Magneto," I should like to draw your attention to several discrepancies and misconceptions therein.

Your correspondent asks, "Why does an engine take more air when travelling fast?" and proceeds in a rather lengthy, indirect way to explain this phenomenon; whereas it is known amongst the scientific people that an engine actually takes *less air per revolution* as the speed increases, due to the throttling or wire-drawing effect at higher gas velocities, and, of course, this is the reason why one has to open the extra air, to make up the deficit due to throttling, in order to keep the mixture strength correct, but at the same time the mixture gradually becomes richer as the speed increases, in a secondary manner, due to the petrol obeying a fluid law of flow, whilst the air supply obeys a gaseous law, which results in a greater weight of petrol being sucked at higher speeds than the air.

Air scavenging has been proved, beyond doubt, to increase the power of a petrol engine, and the writer has recently taken indicator diagrams from an aeroplane engine, air scavenged, which showed an increase of power of twenty-five per cent. over a similar capacity unscavenged type.

It is rather interesting to note that in "Magneto's" simple explanations of the disadvantages of scavenging, based chiefly upon his erroneous figures, he uses the "most efficient mixture" (whatever is meant by this, as authorities upon the subject use four distinct meanings for efficiency, each depending upon the sense in which it is used) as the basis of his beliefs, whereas in his expositions upon combustion chambers he infers that "efficiency is not what is wanted in a motor cycle engine."

D. M. NEWTON.

#### The Transmission Question.

Sir,—We notice in last week's issue of your journal that a correspondent laments the fact that manufacturers generally do not turn out a motor cycle with an under-gear pulley in conjunction with belt drive. Will you allow us to point out that the N.S.U. Co. have marketed several models with the above method of transmission for some years, and that a machine fitted with an under-gear pulley in conjunction with belt drive can still be supplied by them?

N.S.U. MOTOR CO., LTD.

#### Proposed A.C.U. Ten Days' Trials.

Sir,—I see that there is a proposal to combine the A.C.U. Six Days' Trials with the Scottish Six Days' Trials next year, and, as one interested in the manufacture of light cars (may I be excused if I do not call them cycle cars, it is an awful name), perhaps I may be permitted to say how this idea strikes me. At the first glance, the idea appears to be excellent, and would, without doubt, prove a most exacting trial for any machine; but on consideration it has its disadvantages. In the first place it is doubtful if many amateurs (or are they novices now?) could spare time or money for such a protracted trial. Secondly, there is the human element. At the end of the Scottish trial this year, many of the men had done about as much as they could do, and if they had had to go on for another six days many would have retired from ill health. At the end of the A.C.U. trials, which were nothing like so hard, many competitors seemed to have had enough, and the smiles of relief as each man finished on the last day were eloquent of this. Given fine weather in the proposed combined trial all might be well, but I fear ten days of wet and exposure might prove too much for many riders. Thirdly, there is the question, can the smaller and younger firms afford the time necessary

for such a trial? This does not affect the large and established firms who can afford to employ men to ride for them and do nothing else, but it does affect, to my mind, the smaller manufacturer.

In most cases the principals of small firms elect to compete personally in these trials, and wisely so, as they can learn more about the machines they are responsible for in this way than any other. Now to compete in such a trial as is proposed would mean an absence for the best part of three weeks from business for such men, and it seems to me that very few could afford to be so long away from their works. The views of other manufacturers would be of interest at the present moment before the matter becomes one of decided fact.

J. TALFOURD WOOD.

#### Judging Distances with One Eye.

Sir,—Your splendid paper, *The Motor Cycle*, has many a time been called upon to settle a complex question, so I take the liberty to ask the readers to help me in the solution of the following case:

I have a patient, aged about 47, whom I converted into a keen motor cyclist about twelve months ago. Previous to this he had no experience of motors, and could only mount a push bicycle by the step, but now he can mount a  $3\frac{1}{2}$  h.p. by the pedal with engine working.

A fortnight ago he was out shooting, and had the misfortune to get shot in the eye (right). This necessitated the removal of his eye. He now fears he will never be able to motor cycle again, and as this troubles him very much he has asked me to write to your paper to find out if there are any motor cyclists with one eye. Since the removal of his eye my patient cannot judge the distance of objects from him.

Would any motor cyclists who have the misfortune to be minus an eye give me their experiences and the difficulties they have to contend with in the pastime? They could communicate with me direct (my address is Basingbourn, Cambs.), or through *The Motor Cycle*, if you think their replies would be of general interest.

(DR.) SELBY CLARE.

[It is possible that the difficulty may disappear as the patient becomes accustomed to depending upon one eye only.—Ed.]

#### HEAVY-WEIGHT SIDECARISTS.

Mr. and Mrs. R. Holland, of Rawtenstall, on their 6 h.p. Enfield sidecar combination. Mr. Holland scales 16 stones 9 lbs., and his passenger 14 stones 7 lbs., yet after 5,000 miles, including the roughest surfaces, the owner reports complete satisfaction. 80 m.p.g. is given as the petrol consumption.

## PARIS SHOW.

### THE MOTOR CYCLE EXHIBITS.

**W**HEN we visited the Paris Salon on Saturday last we were prepared to find the motor cycle exhibits placed in their usual obscure position, but were hardly conscious of the fact that the motor cycle stands would be all relegated to the galleries. In previous years the large firms have had their motor cycles intermingled with the cars when they happened to be makers of both; this time the large firms, for reasons stated elsewhere, have held aloof. The British made machines are more numerous at this Salon than at any previous Parisian exhibition, which made one feel proud of the position we hold in the industry. The exhibits of Douglas Bros., New Hudson, B.S.A., Rudge, Triumph, Williamson, etc., were all being examined with the greatest interest by French visitors. These machines make the French motor bicycles look very second-rate, as it is only during the last year that French makers have seriously considered the fitting of change-speed gears, and naturally, while the British product has been gradually improving, the Gallic one has been practically at a standstill.

Foreign firms like the Moto-sacoche, Moto-Rêve, F.N., N.S.U., etc., which have had the benefit of British agencies or depots to advise

and help them to keep in touch with modern British requirements have brought their models into line, and their exhibits at the Salon show that they have profited by that experience and advice. Naturally with the Olympia Show only just over there is little to lay before our readers regarding the above-mentioned firms' exhibits and their stands; we shall, therefore, be content briefly to mention the fact that they are represented,

The Reno-Gillet gear box and belt drive. The cylindrical box is built into the frame as shown.

and state for the benefit of foreign readers where they may be found in an exhibition that is bewildering in its maze of galleries, anterooms, and passages.

The decorations, particularly those in the main hall, are indeed splendid. The colour scheme of every stand is identical, i.e., the pillars and

sign are of the same shape and painted a light stone colour with panels of chocolate. On the top of each sign is a kind of inverted chandelier of many imitation candles; these are each tipped with an electric bulb for evening illumination, and when all are lighted and the dome of the Grand Palais and the surrounding panels are all picked out in a blaze of many coloured lights, the effect is magnificent. The lighting of some of the galleries was very bad on Saturday last, and the exhibition closed at 6 p.m. without some stands receiving any light except what was reflected from the main hall and adjacent anterooms.

#### Motor Traffic in Paris.

Outside the exhibition building the mind was bewildered with a rushing stream of taxicabs, private motor cars, etc., and crossing the Champs Elysées was only undertaken at some slight risk. We noticed that *agents de police* were stationed at the important crossings to warn taxi-drivers of their speed propensities, but often without any notice being taken of the caution. When the Show closed at 6 p.m. the rush for the Tube was so great that the entrance to the nearest stations had to be closely guarded by the police, and only a sufficient number of the crowd to fill each train was admitted.

Belt and valve sides of the Austral, a neat single-cylinder machine with Swiss engine.

Both sides of the 3 1/2 h.p. twin Rene-Gillet, showing the two-speed gear box. This was exhibited in an incomplete state.

### Austral.

CYCLES AUSTRAL, 12, Rue de Lamar-tine, Paris (Salle T, Stand 1).—The erstwhile makers of the Austral tricar, once a familiar feature of the Paris Shows, were exhibiting one example of the Austral motor bicycle. This is a 2 h.p. model, 62×82 mm., with an ordinary type of frame and a special spring fork. The blades of the latter are hinged at their centres, and lugs above and below the hinge serve to carry coil springs in compression. A Longue-mare carburetter and Bosch magneto are fitted. The tank is circular and nickel-plated, and a large hand outside oil pump is fitted to the side of the tank well forward. The engine is made by Zurcher et Cie., Pontarlier, and has an adjustable belt pulley.

### Automoto.

AUTOMOTO, Rue Gutenberg, St. Etienne (Balcony, Stand 15).—This firm was one of the first to manufacture motor cycle engines in France. It shows one example of a twin-cylinder belt-driven machine with Moser engine and carburetter, the latter handle-bar controlled. The belt transmission is provided with a jockey pulley for tightening the belt. The magneto is in front of the crank case and silencer underneath it. The hand oil pump is too close to the saddle, otherwise the machine is neat and workman-like in appearance.

### B.S.A.

POTIER LECORSIER AND CO., 196, Boulevard Voltaire, Paris (Salle S, Stand 14).

—One example of the B.S.A. motor bicycle fitted with a cane-seated sidecar. The machine was in a very obscure position, and we only discovered it late one evening just before the building was cleared.

### Douglas.

DOUGLAS BROS., Kingswood, Bristol, and 190, Boulevard Pereire, Paris (Salle U, Stand 1).—Messrs. Davis, who are

the Paris managers of the Douglas business, have staged ten machines, and a very imposing show they make. Nine of the models are the standard gentleman's Douglas with and without change-speed, the other is a lady's. The same firm also handle the Williamson sidecar machine, and examples both of the air-cooled and water-cooled types are on view, also a Canoelet sidecar. The firm will be in possession of new premises on January 1st

A floatless carburetter named "the Fill."

(address as above) next.

### Fill Carburetter.

Of course, there are hosts of accessories of all kinds in the gallery, but the only real novelty of interest to motor cyclists is the Fill carburetter, which we illustrate. This is the product of a firm styled Carburateur Fill (Bonduel, 25, Boulevard Inkermann, Neuilly, Seine).

Briefly described, this has one chamber and no float. Petrol enters at the base, the flow of liquid being controlled by a long taper needle valve which opens more or less according to the suction and speed of the engine. This valve can be adjusted to give a greater or less quantity of fuel to suit engines of various dimensions. The vaporising chamber has one lever only. This raises or lowers the adapter around the jet tube, thereby increasing or decreasing the amount of extra air. With the lever in closed position the suction on the jet is powerful, thus rendering starting easy.

### F.N.

FABRIQUE D'ARMES DE GUERRE A D'HERSTAL, 4-6, Rue Pierret, Neuilly, Seine (Salle T, Stand 103).—The well-known 2 1/2 h.p. two-speed single-cylinder and the 5-6 h.p. four-cylinder models are to be found here, finished in the same style as they were exhibited in London.

### Gillet.

RENE GILLET et CIE., 128, Route d'Orleans Montrouge, Seine (Salle U, Stand 3).—No less than seven different twin models are made by this firm, which is one of the leaders of the

Two views of the 3 1/2 h.p. Harding-Jap, a twin-cylinder machine built in France with British parts throughout. The gear is a Bowden two-speed, the frame Chater-Lea, and the forks Druid.

## Paris Show.—

A Red Cross Service ambulance sidecar attachment shown on Motosacoche stand.

industry across the Channel. The principal patterns, however, are the  $3\frac{1}{2}$  h.p.  $64 \times 76$  mm. = 488 c.c., 5 h.p.  $70 \times 76$  mm. = 584 c.c., and 7 h.p.  $80 \times 100$  mm. = 1,006 c.c. The novelty for 1913 is the change-speed gear, which, previously forming part of the rear hub, is now built into the frame at the bottom bracket in a very neat and workmanlike manner. The gear box is a cylindrical casting, enamelled black like the rest of the frame, and the main shaft is driven by belt from the engine pulley, both pulleys being of equal diameter about  $5\frac{1}{2}$  in. The control pedals are carried on strong bosses formed on the right side of the casing. Patents are pending concerning the internal construction, so the device cannot be described at present. To stop with engine running the control pedal is depressed by the toe, this releases the clutch, a further movement applies the brake, and carried still further the throttle is partly closed to prevent the engine racing. To change gear the heel portion is depressed, which applies the low gear clutch, and upon pressing the heel further downward the high gear is brought into play. The clutches are conical, and, when starting, the high gear cannot be put in without first applying the low gear, an important point in the case of a machine in a novice's hands. The left pedal is used to apply a belt rim brake, and the whole of the rear triangle is covered in by sheet aluminium. Rene Gillet machines all have the magneto fitted in the tank like the Bat, and gear driven by a vertical connecting shaft from the timing gear. The control on the handle-bar is by rotating grips as on American machines. A sidecar is fitted to one or two models; one is made by T. Cadby and Sons, Birmingham, and called the Burbury; the others are by Mills-Fulford, Coventry.

**Harding-Jap.**

H. J. HARDING, 49, Boulevard Gouvion, St. Cyr, Paris (Salle F, Stand 7).—The Harding-Jap is made of British material and parts, the engine is a  $3\frac{1}{2}$  V twin J.A.P., Chater-Lea frame, and Druid forks are used. The two-speed counter-shaft gear is a Bowden, the saddle an X'All, tank Davidson, and belt Watawata. We illustrate this machine. The firm is agent in France for several different makes of English motor cycle parts, among them being J.A.P., Chater-Lea, X'All, Druid forks, Davidson tanks, and the British Hub Co.'s cycle car and other hubs.

**Herdle and Bruneau.**

HERDLE AND BRUNEAU, 93, Pelleport, Paris (Salle T, Stand 5).—Motor cycle sets for attaching to ordinary push-cycles have formed the bulk of this firm's business up to date, but they will exhibit to-day (Thursday) quite a new model, advance particulars of which were given to us by their representative. The new mount is a twin-cylinder vertical model, water-cooled, with bore and stroke  $48 \times 75$  mm.; the connecting rods work on one crank pin, and explosions occur alternately in each cylinder. The transmission is by friction wheel and disc to a counter-shaft, thence by chain to the rear wheel. The feature of this transmission is that every part of it is entirely enclosed. The attachments are the same as those previously described, and consist of a little water-cooled single-cylinder engine fastened under the down tube, and driving by belt.

**Humberette.**

HUMBER, LTD., Coventry (Main Hall, Stand 113).—This cycle car will occupy a position on Humber's motor car stand in the Main Hall by to-day (Thursday), and will doubtless be subjected to the closest scrutiny. At the time of our visit to the Show, it was in the hands of the French customs authorities.

**Motosacoche.**

PAUL MUNCH, 2, Avenue Alphand, Paris (Salle U, Stand 4).—The  $3\frac{1}{2}$  h.p. twin Motosacoche has attached to it an ambulance sidecar with canvas hood and pillow, the hood bearing the cross of the Geneva Convention. The frame is constructed of steel tubing, and is suspended on long laminated springs. Another model new to British readers is a sidecar with the 750 c.c. Motosacoche V twin engine, chain transmission, and substantially constructed sidecar chassis. The attachment of the sidecar is well worthy of attention, and we illustrate the complete machine.

New model 750 c.c. Motosacoche sidecar. This is a very fine example of a chain driven passenger machine. The engine is the same as the Motosacoche firm exhibited at Olympia.

**Malicet and Blin.**

MALICET AND BLIN, 103, Avenue de la République, Aubervilliers, Seine (Salle X, Stand 1).—Some excellently finished examples of cycle car parts, either complete chassis, or gear boxes, steering, front axles, back axles, with balance gear, etc. They are employed on some of the best examples of cycle cars which were shown at Olympia.

**Millford Sidecars.**

JOUBE, M., ET CIE., 145, Boulevard Murat, Paris (Salle T, Stand 12).—The sidecar is not a quarter so popular in France as it is in England, but nevertheless the Millford sidecar should have a fair run in France, as it appears to be in good hands. The agents for the firm, Messrs. Jouve, informed us that the demand is increasing, and they have already sold quite a number of these attachments.

New design Moto-Reve carburettor with separate unions for front and rear cylinders.

**Moto-Reve.**

THE MOTO-REVE Co., 35, Rue de Lancy, Geneva (Salle T, Stand 11).—This Swiss firm exhibit direct the same models that were shown by their agents at Olympia. The English

**Paris Show.—**

machines are fitted with B. and B. carburetters, but those made for the French market have a new carburetter made by the Moto-Rève Co. Provision is made in the body of the instrument itself for the junction of two separate inlet pipes. A concentric type of float

Clutch control lever on the Moto-Rève handle-bar.

is used, and the chamber carries a couple of jets diametrically opposite each other. Below each of these is a small hole in the bottom of the carburetter box, which serves to admit a supply of air. As the sleeve throttle is opened the area of these air ports is increased in unison, whilst for close adjustment a hand-controlled port is arranged on the side of the mixing chamber. The clutch on engine-shaft is also worthy of notice, as it is another item which the English agents do not supply.

**New Hudson (France).**

SOCIÉTÉ FRANÇAISE DE BICYCLETTES  
NEW HUDSON, 5, Rue de Sablonville, Neuilly, Seine (Balcony, Stand 13).—The 2½ h.p. and 3½ h.p. New Hudson models in French grey are suitably staged by the French House. Another machine is painted a brilliant canary yellow with black lines. Canoelet side-cars are fitted to two or three of the machines.

**Simplex.**

SIMPLEX CYCLE CO. (AMSTERDAM), 7, Rue N. D. de Lorette, Paris (Salle T, Stand 13).—The sole example of Dutch motor cycle manufacture in the exhibition is a rather strange-looking machine. The double top tube of the frame goes from the top of the ball head right to the rear axle. The seat tube carries a springing arrangement for the saddle, and the spring fork is a very elaborate arrangement of tubes and joints with compression and recoil springs enclosed in nickel-plated tubes extending from the centre of the hub to the fork crown. The general design of the frame and

A Dutch mount called the Simplex. It is made in Amsterdam, and has a spring saddle pillar, unconventional frame, and spring front forks.

appearance of the *tout ensemble* will be gathered from the annexed photograph and sketch. The engine is a Fafnir, 84×88, and the carburetter is a B. and B.

Detail sketch of the Simplex front fork, showing the case for the springs.

**Wanderer.**

A. HEROLD, 5, Allée Erasme, Ville-momble, Seine (Salle S, Stand 2).—The Wanderer machines were not at Olympia this year, therefore a short description of the new lubrication method will be of interest. The oil is fed into the crank case by hand pump about every thirty miles to keep up the level of lubricant in the chamber. To circulate the oil to the bearings, there is a small oil pump (see sketch) fastened to the side of the crank case. This returns the oil to the reservoir, when the supply, which is pumped in by hand, is exceeded. From the reservoir the oil passes through a sight feed lubricator and down two pipes enclosed in an aluminium covering. These pipes lead, one to the front, the other to the rear cylinder. There is a valve on the sight feed to regulate the flow of oil.

THE SOCIÉTÉ DES ATELIERS D'AVEUGLES (Blind Society), 9, Rue de l'Echelle, Paris.—The motor tandem tricycle on this stand has two saddles. The two front wheels are used to steer, and the rear one to drive. The engine is situated in front of the first rider, and drives by belt. The machine very much resembles a pedal tricycle in appearance, and is on the lines of a sketch suggesting a similar construction published in *The Motor Cycle* of 1903.

**Cycle Car Improvements.**

Two cycle cars, both of which have been fully described and illustrated in previous issues, have undergone modifications and improvements.

THE AUTOMOBILETTE. A. COIGNET, 115, Bd. Murat, Paris (Gallery C, Stand 1).—The first transmission of this machine was by chain from engine to cross-shaft, but the latest chassis shown in an unfinished state has a propeller-drive from the same twin-cylinder vertical engine as formerly used, a Huguélet, to a gear box containing a bevel drive and cross-shaft. The bevel gear allows a reverse to be employed, and the final drive from the ends of the cross-shaft is by V belts to belt rims on the rear road wheels.

The single-cylinder Automobilette

Rose engine clutch fitted to the Moto-Rève engine-shaft.

Oil pump on Wanderer crank case.

## Paris Show.—

The friction transmission of the Violette cycle car. On the latest model the disc and wheel are situated midway between dash and rear axle, this shortens the chain and dispenses with the jockey pulley.

remains unchanged, except as regards the engine, which is now a Huguelet of the same type as the twin vertical engine referred to in a previous paragraph.

Wanderer lubrication system. The sight feed oiler.

### The Violette Friction-driven Cycle Car.

FRANC ET CIE., 55, Rue Frères Herbert, Levallois, and whose English address is now Violette Cars (England), Temple Chambers, Temple Avenue, London, E.C. This has the friction wheel and disc placed midway between the dash and rear axle, the drive being connected to the engine by a propeller-shaft and to the rear axle by a chain. Formerly the friction mechanism was close to the dash, and the transmission from that point to the rear was by a rather long chain which ran over jockey sprockets by which the chain was adjusted.

### Various Exhibits.

The following machines were exhibited by various wholesale and retail agents. We indicate the positions of the stands and give the agents' names and addresses for the benefit of foreign readers of *The Motor Cycle*, but any further description of the machines is unnecessary, as they have all appeared in these pages within the last few weeks.

A. AND L. LEVY, 27, Rue St. Ferdinand, Paris (Salle I, Stand 1.)—Calthorpe motor cycles and Garrard-Maxfield sidecars.

LONGUEMARE FRERES, 12, Rue du Buisson-St.-Louis, Paris (Salle N, Stand 6).—One  $3\frac{1}{2}$  h.p. motor bicycle with Sarolea single-cylinder engine. This was exhibited to show the control and fitting of the automatic Longuemare carburetter for motor cycles.

W. H. DOREY, 14, Rue Torricelli, Paris (Salle G, Stand 10).—The Dorey 50° twin cycle car engine, 85 × 95 mm., has side by side and very large inlet and exhaust valves. Both are interchangeable, and no less than 2 in. diameter at the head. The carburetter is a Claudel and the magneto a Bosch; the latter is gear-driven by an enclosed train of pinions situate across the front of the crank case.

### Hugo Storr.

HUGO STORR, 17, Rue Saussier-Leroy, Paris (Salle S, Stand 4).—N.S.U. and Rudge-Whitworth machines, for which this firm is agent for France. The models are exactly the same as those exhibited in England. The Rudge came in for special attention, doubtless due to the number of Continental wins to its credit this year.

The chain drive of the Automobilette cycle car is now replaced by a propeller-shaft and bevel gear providing a reverse. The final drive is by two V belts.

### Triumph.

AUTO VELO Co., 23, Avenue du Roule, Neuilly-sur-Seine (Salle S, Stand 3).—A little crowd surrounded the stand on which Triumphs were displayed whenever we passed near to it. The Triumph is well known and feared among French competitors in races and trials, and has wrested some of the best prizes from the French this year and last.

### Tyre Firm's Display.

The British motor tyre industry is represented by the North British Rubber Company, 27, rue Jean Jacques Rousseau, Paris, and the Palmer Tyre, Ltd., 152, Avenue Malakoff, Paris, who exhibit the machine which is used in the construction of the Palmer cord fabric.

The Dunlop Rubber Co., Ltd., 4, rue du Colonel-Moll, Paris, have a stand in the balcony, as also the Paris Continental Tyre Co.'s house, of 146, Avenue Malakoff, the French Goodrich Co., 221, Boulevard de Valmy, Colombes, Hutchinson Co., 60, rue St. Lazare, Paris, and last, but not least, the Michelin Tyre Co., of Clermont Ferrand.

### Model Wind Waggon.

One or two very neat little model motor cars are on exhibition. The one on the Cadillac stand is an exact reproduction of a larger car, and is propelled by a Cadillac electric motor used for the self-starter. The little vehicle will run an hour on one charge of electricity at a speed of about ten miles an hour. Another has a small air-cooled engine at the rear of the two-seated body, and drives an aeroplane propeller.

The propeller, which is about two feet diameter, is enclosed in a circular wire screen. We hardly know whether a juvenile would be allowed to drive such a machine on the public roads in France, but, of course, its use in this country would be restricted to private premises in the case of children under fourteen years of age.

Another, called the Baby Auto, has a friction drive, and is offered as a high-class toy for use in large private pleasure grounds.

G. L. Drew (3½ Premier)		J. Stevens (2½ A.J.S.)	F. A. McNab (3½ Ariel)	J. Pechey (3½ Premier)
		H. Stevens (6 A.J.S. sc.)	J. S. Holroyd (3½ Moto-sacoché)	
		W. Hanson (5 A.J.S.)	G. P. Howe (—)	
		E. J. Webster (6 Zenith sc.)	F. W. Carrier (3½ Imperial)	
		W. E. Roots (—)	S. J. Saunders (3½ Rudge sc.)	
			M. Geiger (3 V.S. sc.)	

It must be noted that the return journey has been made more difficult, and the hilly road from Sidford via Lyme Regis to Dorchester will be followed. The following timetable will allow interested motor cyclists to watch the competitors pass through the more important places. Leave Exeter 6.30 a.m., Sidford 7.17, Lyme Regis 8.1, Bridport 8.28, Dorchester 9.12, Salisbury 11.4, Basingstoke 1.52 p.m. The first man is due at Hounslow at 3.40 p.m. Most riders will therefore finish in daylight.

NOT BROOKLANDS!—THE TORONTO M.C.C.'s HILL CLIMBING CONTEST.

This hill—said to be the steepest in Toronto—is located on Bathurst Street, about half-mile north of St. Clair Avenue. The gradient is 1 in 6½. The numerous bumps and ruts on the hill caused a great many spills and several of the machines were unable to make the ascent.

AEROPLANE COMES TO GRIEF IN LONDON.

On Friday an aeroplane came down on to the roof of a house in Derwent Road, Palmers Green, North London. A large hole was made in the roof, but the pilot, M. Mario, who was flying from France to London, and at the time of the accident was making his way to Hendon, escaped injury. He was eventually rescued by means of a ladder.

**TIME TO LIGHT LAMPS.**

Dec. 12th	...	...	4.49 p.m.
" 14th	...	...	4.50 p.m.
" 16th	...	...	4.50 p.m.
" 18th	...	...	4.50 p.m.

**A Business Trip in Canada.**

W. W. Douglas, the well-known Douglas competition rider and son of the proprietor of Douglas Bros., is leaving for Canada on the 26th inst. per the R.M.S. *Oceanic* from Southampton. He will be accompanied by J. B. Clarkson, of Wellington, New Zealand, who will travel with him as far as Victoria, British Columbia.

**Much Safer Roads.**

In view of the recent outcry in connection with motor accidents in the Manchester district and the formation of the National Road Guards (self-styled) by certain members of the Manchester centre of the C.T.C., it is particularly interesting to note that Mr. R. Peacock, the chief constable of Manchester, has stated that more accidents, fatal and otherwise, have been caused by trams than by motors, in spite of the fact that 5,000 driving licences have been issued in the city. He also said that undue prominence was given to motor accidents in the daily press.

**Sound Advice Concerning Cycle Cars.**

At the annual dinner of the Triumph C.C. last Friday, Mr. M. J. Schulte, who presided, gave his opinion of cycle cars. He said that lately a new baby had come into the motor line, and that was the cycle car, but he was afraid that it had had rather a premature birth into the world. He believed that the trade was not generally ready for it, and he thought that 1913 would see a great many failures in this line. When one took a walk round the recent Show one found that many of those small cars were in a very crude and experimental stage. The movement had come too rapidly, and he hoped that everybody connected with the trade would move slowly and cautiously or else they would find that it had come before its time, and would die out again.

**Lantern Lecture in Coventry.**

Members of the Rudge-Whitworth C.C., Coventry, listened to an interesting lecture on motor cycling delivered by Mr. V. A. Holroyd one evening last week. The lecturer was assisted by a quantity of lantern slides depicting Rudge motor cycles in course of construction at the works and in use on road and track.

**French Hour Record.**

On Saturday afternoon last, at the Parc des Princes Track, Paris, Lombard attacked the French hour record for motor cycles of 500 c.c., and succeeded in beating Grapperton's previous performance of 85 kilometres 320 metres by 480 metres, covering 85 kilometres 800 metres. This distance equals 53.28 miles. The English hour record, made by G. E. Stanley, October 15th, 1912, on a 500 c.c. Singer, stands at 67.42 miles, a difference of 14.14 miles. Lombard rode an Albatross.

**Air-propelled Motor Cycles.**

Concerning the article in the current issue, no less an authority than Mr. S. F. Edge recently stated that he felt sure that the air-propelled motor car had a great future. Of course, the same remarks apply to motor cycles in a marked degree on account of their lighter weight. Mr. Edge does not suggest that screw-propelled cars will come into use in populous countries, but in wild, rough, and open areas.

A propeller-driven motor cycle is not new, nor is it new applied to a cycle car. A 7 h.p. twin-cylinder motor bicycle some years ago attained a speed of 50 m.p.h. on the road, the tests being made in connection with the form of aeroplane propeller used. We illustrated a Beacon cycle car with a propeller at the rear in our Passenger Issue of November 14th.

**Hill-climbing in Australia.**

Some months ago a well-known rider achieved the feat of climbing the famous Oberon Hill, at the Jenolan Caves. On a recent Sunday twenty-five members of the Sydney Motor Club, who selected this way to proceed to Yetholme, successfully ascended this hill on full touring machines. The gradient of the hill is rather severe, as it rises 1,900ft. in three miles, and there are bends to negotiate. Norman Saunders, one of the party, mounted on a 3½ T.T. Bradbury, with a 5 to 1 single gear, put up a very creditable performance in riding from bottom to top in seven minutes. Alf. Foy, on a 7-9 Peugeot and sidecar, also successfully ascended the hill. He has the honour of being the first sidecarist to climb the hill.

**A.A. and M.U. Notes.**

The Association learns that the road from Helmsley to the top of Sutton Bank, via Rievaulx and Scawton, is not now suitable for motor traffic. There is a much better road via Sproxtun and Waterloo Lane. Members are advised to use the latter, and proceed from Helmsley over the Rye, and then take the first turn to the right (near the Nelson Gate leading to Duncombe Park).

**SPECIAL FEATURES:**

**PARIS SHOW.**  
**PASSENGER MOTOR CYCLES.**  
**MUDGUARDING.**

**SPEED LIMIT.**—An application has been lodged for a ten miles per hour speed limit for certain portions of the Thame Road and Aylesbury Road, Duke Street, High Street, and Bell Street, at Princes Risborough (Bucks). Objections must be lodged on or before December 23rd. Therefore members able to furnish evidence or information bearing upon this application, should communicate their views to the secretary as early as possible.

**MISLEADING FLASH LAMPS ON HIGHWAYS.**—Complaints are coming in from members regarding the flashing of electric pocket lamps in front of cars and motor cyclists by pedestrians. In connection with the complaints received concerning this practice at Swindon, it is satisfactory to note that the Association has obtained the hearty co-operation of the police authorities in suppressing it.

**The Gometz-le-Chatel Hill-climb.**

The following English motor cyclists have signified their intention of crossing over to France this week-end for the Gometz-le-Chatel hill-climb next Sunday: S. T. Tessier (Bat), A. J. Dixon (Singer), G. Griffiths (Ariel), T. M. Rogers (Matchless), W. H. Bashall (machine not stated). Sidecars: F. W. Barnes (Zenith) and W. Pratt (P. and M).

The British contingent leave Charing Cross to-morrow (Friday) evening at nine o'clock.

**New Main Road out of Portsmouth.**

A meeting of influential inhabitants and representatives of outlying districts was held at the Portsmouth Town Hall last Monday evening, the Mayor (Alderman Corke) presiding. A resolution was unanimously passed in favour of a new wide road being constructed out of the borough of Portsmouth into the county of Hampshire. The Corporation of Portsmouth has been asked to take up the proposal.

**Nice-Turbie Hill Climb.**

This event is to be decided on December 15th. The mountain pass is over four and three-quarter miles in length, and is full of sharp turnings. The motor cycle climb will comprise two classes, those who compete for a club challenge prize and a purely speed event. To be eligible for the former machines must be fully equipped. The following French machines have been entered: 3 h.p. Moto-Réves, 2½ h.p. Peugeots, 3½ h.p. Zedels, 2½ h.p. Terrots, and 3½ h.p. Magnat Debons.

**Repairing Brooklands Track.**

Repairs are in progress on Brooklands track, the stretch near the Members' Bridge receiving attention.

**The Auto Cycle Union Silencer Trials.**

The Auto Cycle Union has invited a Local Government Board official to witness the silencer trials, which are to be held in January.

**From Overseas Readers.**

Our postbag last week brought many interesting letters and photographs from readers scattered all over the world. A selection of the communications appears in the current issue.

**Bravo, Bobby!**

A well-known rider recently arrived in a populous part of London in the wee sma' hours with no lamp. After daringly running the gauntlet, he finally found himself cornered. No escape being possible, he brazenly asked the officer to lend him his lantern while he went to the nearest garage to borrow one. Much to his surprise his request was granted. We echo Bravo, Bobby! may you have speedy promotion!

**British Imports and Exports of Motor Cycles.**

The value of imports and exports of motor cycles for the month and eleven months ended November 30th for the last three years is given in the following tables:

**IMPORTS.**

Month ended November 30th.

	1910.	1911.	1912.
	£	£	£
Motor cycles ...	2,101	2,216	2,180
Parts thereof...	4,771	7,177	12,248
<b>Total ...</b>	<b>£6,872</b>	<b>£9,393</b>	<b>£14,428</b>

From this table it will be noticed that while the imports of parts have increased by £5,071, the motor cycle imports have decreased £36.

Eleven months ended November 30th.

	1910.	1911.	1912.
	£	£	£
Motor cycles ...	42,756	39,955	40,436
Parts thereof...	51,803	62,024	147,110
<b>Total ...</b>	<b>£94,559</b>	<b>£101,979</b>	<b>£187,546</b>

**BRITISH EXPORTS.**

Month ended November 30th.

	1910.	1911.	1912.
	£	£	£
Motor cycles ...	15,309	46,113	60,581
Parts thereof...	2,816	11,367	19,299
<b>Total ...</b>	<b>£18,125</b>	<b>£57,480</b>	<b>£79,880</b>

The value of our exports of motor cycles and parts is still steadily assuming large figures. The total exports for the eleven months ended November 30th of this year, as the following table shows, are over double the amount of the corresponding period in 1911:

Eleven months ended November 30th.

	1910.	1911.	1912.
	£	£	£
Motor cycles ...	108,655	244,406	481,379
Parts thereof...	34,879	67,935	170,566
<b>Total ...</b>	<b>£143,534</b>	<b>£312,341</b>	<b>£651,945</b>

**FUTURE EVENTS**

- Dec. 14.—Herts. County A.C. Open Quarterly Trial.  
 „ 21.—Sutton Coldfield and Mid-Warwickshire A.C. first Cycle Car Trial.  
 „ 26.—N.W. London M.C.C. Open Winter Run to Gloucester and Back.  
 „ 27-28.—M.C.C. Annual Winter Run to Exeter and Back.  
 1913.  
 Jan. ..—A.C.U. Open Silencer Trial.  
 „ 18.—North Middlesex M.C.C. Open Trial.

**Another Australian Record.**

Last month at Melbourne, J. Booth, holder of two championships, attacked the one hour Australian track record, and although the three-lap track was not in the best condition, he covered 52 miles 201 yards. His machine was a  $3\frac{1}{2}$  h.p. B.S.A. shod with Dunlop tyres.

**The Speed of Motor Cycles.**

Our attention has been drawn to a suggestion made by the Coroner during the inquest, at Truro, on a motor cyclist, who met his death by colliding with a car which came out of a side road, that it was necessary "to keep a motor cycle running at 30 m.p.h. in order to keep the engines going properly." This is, of course, a misstatement, and unfortunately there appears to have been no one present sufficiently conversant with the subject to contradict the impression conveyed by this suggestion. It would be a great pity if the idea became general, for it is entirely erroneous, as all our readers know, and it is to be regretted that any person in authority should, without exact knowledge, have given expression to such a notion, for the man in the street will swallow anything, especially if it happens to be somewhat to his taste.

**Roads Improvement Association.**

On and after the 20th December the headquarters of the Roads Improvement Association (Incorporated) will be transferred to 15, Dartmouth Street, Westminster, London, S.W.

**Mystery of Motor Cycles.**

We read in a daily paper that the Kent police are investigating a curious case of three motor cycles. A few days ago a motor cycle was left at an inn near the canal at Gravesend by a stranger, who did not return. On Thursday two motor cycles were discovered in the canal in the same locality. Both are said to be in good condition.

**French List of Motor Cycles Registered.**

The following table showing the numbers of motor cycles in use in Great Britain, France, and Germany from 1907 to 1912 was published recently by our French contemporary, the *Auto*. We do not vouch for the accuracy of the figures, but reproduce them as an item of interest:

Year.	France.	Germany.	Great Britain
1907 ...	35,111	15,954	34,664
1908 ...	27,473	19,808	35,247
1909 ...	27,215	21,176	35,784
1910 ...	28,840	22,379	36,242
1911 ...	27,061	20,705	48,857
1912 ...	28,641	20,157	71,020

**Motor Cyclist Despatch Riders.**

We are informed that the Royal Engineers, Territorials (headquarters, 12, Palmer Street, Westminster, S.W.), have lately formed a motor cycle section. There are at present ten vacancies in the troops as despatch riders. The corps consists of wireless, cable, and air line telegraph units. Intending members should preferably be engineers or telegraphists, though this stipulation is not absolutely enforced. Allowance and conditions of service are set forth by "Celeriter" in our issue of October 17th (page 1170). Applications should be addressed to the headquarters.

A sidecar ambulance, patented by the French manager of the Motosacoche firm and exhibited on their stand at the Paris Show.

# A LECTURE ON CYCLE CARS.

ON Saturday last, at the Imperial Hotel, Mr. R. Vernon C. Brook, A.M.I.E.E., read a paper on "Cycle Cars" before members of the Birmingham M.C.C.

He opened his remarks by stating that when he agreed to lecture on this subject he had no idea of how many machines there would be to deal with. Owing to their mushroom growth he did not intend to deal with each one individually, but would be content to deal with each class.

The motoring millennium had not yet arrived, and in this respect the British public, which has been bolstered with this idea by the press, was doomed to disappointment.

In Mr. Brook's opinion the present cycle car is in no way the descendant of the old Ariel and De Dion type quad, but a modern growth which originated in the Bedelia and Dew spider quad. He proceeded with the history of the cycle car (to which name, by the way, he particularly objects, preferring runabout or carette), and stated that at the recent Show, out of thirty-six makes, ten were water-cooled.

American competition will, he thinks, to some extent, affect manufacturers as well as the demand, but the American car cannot compete with the cycle car for running costs.

Probably runabouts will finally oust the heavy twin and sidecar, but will not affect  $3\frac{1}{2}$  h.p. and  $4\frac{1}{4}$  h.p. combinations.

Two types of cycle car will probably remain. The miniature car and the belt, chain, or friction driven models, mainly on motor cycle lines.

Mr. Brook has faith in the armoured wood frames, transverse semi-elliptical springs, steel wheels, and a four-cylinder water-cooled engine. The design of steering, gears, reverse gears, tyres, and body work, was touched upon and dealt with in a sound commonsense manner, as also were the merits of three and four-wheelers and tandem or sociable seating.

With regard to the motor cycle type he recommended a silent chain drive to the counter-shaft and belt drive thereafter on the lines of many well-known present day cycle cars. He suggested the fitting of a flywheel on the counter-shaft and of a crossed belt for the reverse to come into action when the axle is in its most forward position. Nearly all forms of cycle car transmission were dealt with, and special attention was drawn to the bad practice of fitting an auxiliary flywheel and clutch to engines not designed for the purpose. Torque rods were mentioned as an important point which has not received the necessary attention.

Mr. Brook estimated the running costs of an 8-10 h.p. runabout to be 40% more than a single-cylinder sidecar combination.

Altogether the subject was dealt with very fully, especially considering its scope and the limited time at the disposal of the lecturer. A discussion followed.

## The Discussion.

Mr. F. E. Baker, who occupied the chair, opened the discussion by first thanking Mr. Brook for his excellent paper. He considered that Mr. Brook had covered the subject comprehensively. He did not agree with the lecturer that the early motor cars, such as the Bollée, De Dion quad, etc., were not cycle cars; on the other hand they were the first real cycle cars. Mr. Baker considered that the cycle car movement was likely to cause a revolution in road transit far greater even than the most optimistic mind could contemplate. He did not agree with the lecturer in his remarks on gear-driven versus friction and belt-driven machines; he considered the question of relative costs of the two types was not so much one of labour charges as capital charges, and he thought that, given sufficient capital, it would be easy to produce gears at a price that would compare favourably with the belt and friction drives. Mr. Baker was sorry there was a prejudice against drum and cable steering, as he considered this type quite satisfactory and cheap to produce. Single-cylinder engines of big cubical capacity would, in his opinion, be the solvers of the cycle car engine proposition.

## Air v. Water-cooling.

The Chairman said he hoped there would be a discussion on the merits of air versus water-cooling. Personally he considered "mechanical cooling," as he preferred to call air cooling, quite efficient up to a certain point.

Mr. E. W. Winckle considered the 5-6 h.p. single-cylinder quite efficient for cycle car work, provided the engine speed

was kept up. He thought that with a single-cylinder engine it would be possible to keep prime costs down. He considered a reverse essential on all cycle cars, and mentioned that at least one manufacturer was contemplating a three or four-speed motor cycle gear box with a reverse for side-car work.

Mr. F. Lewis said he had had 4,000-5,000 miles' experience with a Morgan three-wheeler, and he could safely say that with care there was no risk of serious skidding to be feared through having three wheels. With regard to water cooling, he mentioned that he had once covered five or six miles on the low gear with his air-cooled engine without experiencing the slightest difficulty through overheating. A reverse might be useful at times was the conclusion he had come to after driving in all kinds of traffic.

## The Earliest Cycle Cars.

Mr. H. S. Bilbe mentioned the names of several early machines which the lecturer had not spoken of. He quoted the De Dion Spider, the V.S., the O.T.A.V., the Chater-Lea carette, and others. The four year old Chater-Lea carette with Sarolea engine had a combined belt and chain drive, and thus anticipated some of the present day models by a considerable margin. He considered the belt or chain drive on to one wheel quite satisfactory, and by this means a differential was unnecessary. He rather wondered whether the lecturer had forgotten the early 6 h.p. Rover, which was, in his opinion, the first real cycle car. He did not agree with the lecturer that side doors were not necessary. The tandem machine had one strong point against it, inasmuch as the narrow track would not fit the track of other road vehicles, therefore it was impossible to take advantage of the best road surface. He considered that automatic lubrication should be standard on all cycle cars.

Mr. Chalmers (B.S.A.) did not consider that American competition was a serious factor, for he thought the depreciation on an American car might be put down at at least 50% per annum, whilst depreciation on a British built cycle car would not exceed 25% per annum. He had had a good deal of unsatisfactory experience with a tandem cycle car of the belt-driven type. He considered that makers should pay more attention to the lubrication question. With efficient lubrication the air-cooled engine would give much better results than it does even now.

Mr. Biggs (Humber, Ltd.) said that his experience of worm drives had not been satisfactory. He considered the worm drive had far less "go" in it than a bevel drive. An expensive worm gear might give better results than a cheap bevel gear, but he considered, quality being equal, that the bevel drive was most satisfactory.

Mr. Ivy-Rogers (New Merlin Cycle Company) fully agreed with the lecturer that the four-cylinder water-cooled engine would ultimately become universal in cycle car practice. The absence of vibration and smoother running would give longer life to the whole vehicle. He agreed that the V type twin would probably be standard for a year or two. Water cooling was, he considered, essential. He did not agree with the lecturer on the transmission question. He considered that the combination of shaft from engine to gear box, and chain from gear box to differential, would become universal, thus obviating either bevel or worm drives.\* This system would be considerably cheaper than if a bevel or a worm was employed. He did not agree that side doors were not necessary, and pointed out that a saving of a few shillings as quoted by the lecturer was not worth consideration.

Mr. H. C. Pickering quoted the report given in the current issue of the *B.A.C. Journal* regarding the test of a friction driven car; he pointed out that the majority of the troubles experienced during the trial were due to slipping friction drive due to wet on the friction wheels.

## Author's Reply.

In replying to the discussion, Mr. Brook said how glad he was that his paper had brought forth such a large amount of discussion. It was always a lecturer's object to make his paper as controversial as possible in order to encourage a good discussion, and, having attained that end, he felt he had been rewarded with some measure of success. He agreed with Mr. Baker that the cycle car movement was likely to assume enormous dimensions in the near future.

**Lecture on Cycle Cars.—**

Replying to the question raised by one or two speakers regarding satisfactory single-cylinder engines for cycle cars, the author did not consider it possible to get a balance in a big single-cylinder engine that would give as smooth and flexible running as it was possible to obtain with a twin-cylinder engine. A big heavy flywheel was possibly a partial solution of the difficulty, but this added extra weight to the car if it was to be of sufficient dimensions to overcome the vibration.

In reply to Mr. Winckle, the author stated that he agreed that a reverse would be very nice on all cycle cars, but it would be possible to get along on the cheaper machines without it, and it was by doing without such luxuries that the cheap vehicle could be produced.

In reply to Mr. Lewis, the author pointed out that he had admitted in his paper that it was possible to drive a three-wheeler on bad roads without risk of skidding provided the speed were kept down to 8-10 miles an hour when cornering or crossing tram lines or turning out of the line of travel. He would like to add that a steel-studded single driving wheel was also apt to skid on dry granite setts.

Replying to Mr. Bilbe and also to one or two other speakers on the subject of side doors, the author stated he was not thinking so much of the saving in cost of a body

without side doors as the greater satisfaction to be obtained from a body which was solid all through.

On the lubrication question, the author agreed that automatic lubrication would ultimately become standard; in the meantime the semi-automatic hand-operated pump was a very good makeshift.

**Transmission.**

The author pointed out that he had quoted the shaft and chain drive transmission in his paper, and agreed that this system might obviate the worm and bevel drive\* and become very common.

On the subject of carburettors, he believed the automatic carburettor would become universal.

Regarding the friction-driven car tests quoted by Mr. Pickering, the author thought it only fair to point out that the car under test weighed close on 11 cwt., and in addition was probably heavily loaded with luggage, so that it would be unfair to judge the average friction-driven cycle car which weighed 50% less on these figures; further, the car under test was evidently insufficiently shielded from the wet.

[\*Unless the engine and gear box are set across the frame, in which case there is usually little room for a shaft, this form of drive does not obviate the use of a worm or bevel.—Ed.]

**M.C.C. Eleventh Annual Dinner.**

**T**HE Motor Cycling Club has reduced the club dinner to a fine art. At the M.C.C. dinner last Saturday the speeches were brief, to the point, and brought down to the smallest possible number, and the distribution of prizes, which formerly took up an inconsiderable time, occupied only a quarter of an hour, so most of the period between the loyal toast and "God Save the King" was filled up with the very excellent musical programme, for the organisation of which Mr. Ernest Cheny, a member of the club, was responsible. There is no little doubt, therefore, that the M.C.C. is fully conversant with the running of social events.

The dinner took place in the Renaissance Saloon at the Royal Adelaide Gallery, King William Street, W.C. Mr. Charles Jarrott, president of the club, occupied the chair.

After the Chairman had proposed the health of His Majesty the King, Mr. Robert Todd, chairman of the Auto Cycle Union, proposed the toast of the M.C.C. The club, he was glad to say, went on making history and doing things. Like one of the Balkan States, it stood alone. That state had now found the benefits of union with the other states, and he, as chairman of the A.C.U., hoped that soon the M.C.C. would follow this example. In view of the present developments in the motor cycle world, he wondered what sort of motor cycle car the members of the M.C.C. would go in for, and what would happen to it afterwards. He then referred to his early experiences with the oldest form of cycle cars, the ancient quads, one of which he had driven for 10,000 miles.

Mr. Southcomb May (secretary M.C.C.), in response, made a very brief speech. The actual membership, he said, was 445, and with members to be elected at the next committee meeting it would soon approach 500.

**Presentation of Prizes.**

Mrs. Charles Jarrott then presented the prizes, among which the most important were the Jarrott Cup, won by Harold Karslake (familiarily known as "Oily") with an error of only 52s. over the whole distance from London to the Land's End and back; the M.C.C. London to Edinburgh Cup by George Brough, for the third time in succession, so that the cup now becomes his absolute property; and the team prize cup presented by *The Motor Cycle*, which has been won by four different clubs, and this year by the Nottingham M.C.C.

Mr. Robert Head (chairman M.C.C.) announced that Mr. Arturo Mescini, proprietor of Pagni's Restaurant, and a member of the club, had offered a valuable prize for a competition, if held in Switzerland in August, and undertook to entertain for two days all who took part at Lugano. (This matter will, of course, come up for consideration by the M.C.C. committee.)

Mr. Head also proposed a vote of thanks to Mrs. Jarrott for presenting the prizes, and announced that she had offered prizes for the cleanest and driest men to arrive in Edinburgh on the occasion of the famous Whitsun run (cries of "Here's a chance for 'Oily'"), which she herself would judge.

Mr. B. Mariani, in proposing "The Visitors and Press," mentioned that it had been said that the Club was falling away on the social side, but he was pleased to see that by the attendance at the dinner this was not so. He was extremely gratified that so many ladies had put in an appearance. Among the visitors he mentioned Major Lloyd and the many valuable members of the press whom the M.C.C. counted as its friends.

**Brooklands' Bumps.**

Major F. Lindsay Lloyd, in reply, said he had some difficulty in responding for the Press, but on behalf of the members of that profession he thanked the M.C.C. for always providing plenty of "copy." He thanked the last speaker on behalf of the ladies, and concluded by hoping those who rode on Brooklands tracks would survive its bumps. (Here a noisy party in the far off corner of the room sang "We don't want to go to Brooklands Track, to Brooklands Track, 'cos if you make a noise they'll send you back, etc.," and the "Galloping Major," much to the amusement of that gallant officer.)

Mr. L. A. Baddeley, in proposing the health of the "Chairman," said the Club ought to be thankful for having a "live" president, and spoke of the splendid interest Mr. Jarrott took in all the important competitions, how he turned up at the start of the Edinburgh run and drove through with the competitors, at the start and finish of the winter run, and at the start and finish of the Jarrott Cup run, wishing every starter the best of luck, and giving every finisher a cordial welcome.

Mr. Jarrott, in reply, said he was pleased at the good fellowship and good feeling which prevailed, and he hoped the Club would always uphold the ideal of sport. Touching the cycle car, this, he said, was no new type of vehicle. It was at least ten years old, but the earlier types were not built with the knowledge prevailing at the present day. The cycle car must go through many trials and tribulations before it reaches the perfection the present day motor cycle has attained. He, however, looked on the movement with interest, and thought it had possibilities. He trusted that those present would remember that they were *the Motor Cycling Club*, and would maintain that position, and keep the sport of motor cycling before them for all time.

The proceedings concluded with the singing of "Auld Lang Syne."

## The Cycle Car Club Opening Meet.

THE opening meet of the Cycle Car Club took place at the Hut Hotel, Wisley, that comfortable and greatly appreciated hostelry on the Portsmouth Road, midway between Cobham and Ripley. The sun did not shine on the first event the club ever organised. Instead he hid his face behind dreary clouds and a misty rain fell, of which those in the less protected vehicles got the full benefit. We were given a seat in the new Sherwyn cycle car, a most comfortable vehicle, with ample seating accommodation, well sprung and equipped with hood and screen and dickey seat. Mr. Sherwell was at the wheel, and Mr. Selwyn rode behind. Our photographer had a most successful run down on a Duo driven by Mr. Messerby, which took all hills on top speed. The meet was timed for 1.30 p.m., but, owing to the non-arrival of Mr. Greenhill, who experienced carburettor trouble, it was nearly 2 p.m. before lunch was served. Altogether twenty-two members sat down at the tables and fifteen cycle cars put in an appearance. These consisted of Duos, G.N.'s, G.W.K.'s, Humberettes, a Sherwyn, a Bedelia, an Averies, and a Parnacott. The latter

vehicle was a distinct departure from standard practice. It is driven by an air-cooled F.N. motor cycle engine set transversely in the chassis and situated well to the front. The power is transmitted by two chain to the counter-shaft, and thence by two more to the differential. These chains are all enclosed. The chassis is suspended on double transverse springs fore and aft, and should be most comfortable. The engine can be started from the driver's seat. This was the first appearance of the Parnacott in public, and a detailed description of it will appear shortly in these pages.

The leading lights of the Cycle Car Club were present, and among these may be mentioned Messrs. Glyn Rowden (chairman) and the joint secretaries "G.O.K." Thomas and Osmond Hill. The Rev. E. P. Greenhill duly arrived, and after lunch those who had leisure were entertained by him at his house at Walton-on-the-Hill, near Epsom. Several troubles were experienced between London and the Hut, but as this was an informal meet we refrain from mentioning them in detail.

General view of the first cycle car meeting at the Hut, Wisley, last Saturday.

## CLUB NEWS.

### Streatham and District M.C.C.

On January 4th, 1913, the annual dinner will be held at Holborn Restaurant, at 7 p.m.

### Southampton and District M.C.C.

The second annual dinner took place on the 4th inst. at Scullard's Hotel, fifty-eight members and friends being present. This was followed by music and the presentation of prizes.

### Kingston and District M.C.C.

Between sixty and seventy members were present at the first annual dinner held on the 3rd inst. at the Kingston Hotel. This was followed by the presentation of prizes.

### Manchester M.C.

As usual the above club's annual dinner and prize distribution, held at the Albion Hotel, Piccadilly, Manchester, last Friday evening, was a most enjoyable and well attended gathering. In responding to the toast of "The Visitors," Mr. R. Peacock, the Chief Constable of Manchester, as a leading guest, stated that over 900 motor cycles had been registered at the Manchester Town Hall this year, and over 5,000 driving licences had been issued. He deplored the outcry as to motor accidents, and said too much was made of them and undue prominence given to them, while accidents due to other vehicles were ignored. As a fact, more accidents, fatal and otherwise, had, in the Manchester area, been due to tram cars than motors.

### Bury and District M.C.C.

At a well attended meeting, held at the Royal Hotel, Silver Street, Bury, on Thursday, the 5th inst., a motor cycle club was formed. Mr. H. Clough, 80, South Cross Street, Bury, was appointed secretary. Another meeting will be held at the same hotel this evening (Thursday) at 8.30.

### Brighton C.C. (Motor Section).

A special meeting of motor cyclists was held at the headquarters of the Brighton Cyclists' Club, 190, King's Road Arches, on the 4th inst., to consider the advisability of forming a motor cycle club or section of motor cyclists to the present club. The chair was taken by Mr. Geo. White, and there was a large attendance of members and others interested in the pastime, and it was unanimously decided to form a motor section to the Brighton Cyclists' Club.

### The Coventry and Warwickshire M.C.

The membership is still on the upgrade, the total number on the books now having reached 194. The attention of the Chief Constable of Coventry has been drawn to the prevalent practice of carters overloading their vehicles with scrap iron turnings when carting from the works, with the result that the streets are strewn with iron scrap, and considerable damage to rubber tyres is likely to accrue. Monetary assistance is being given to the Daventry Rural District Council towards the cost of improvement to certain roads. The annual Yuletide run is arranged for the 28th inst.

## Club News.—

## Birmingham M.C.C.

A smoking concert will be held on Saturday, the 14th inst., at the Imperial Hotel, Temple Street, commencing at 8 p.m.

## The Cycle Car Club.

The fixtures arranged for next year are as follows:

January.—Lecture by Dr. A. M. Low, B.Sc.

March 15th.—100 miles non-stop run.

Easter.—Welsh tour.

April 19th.—Petrol consumption trial.

May 3rd.—Gymkhana.

May 11th.—Whitsun rally of cycle cars from all parts of the country.

May 24th.—Ante-breakfast paper chase.

June 23rd.—Open hill-climb.

July 5th.—Ladies' run.

August 4th.—London to Paris trip.

September 13th.—Members' flexibility trial.

## Eastern Province M.C.C. (South Africa).

On October 23rd a meeting was called of the motor cyclists of Port Elizabeth, as a result of which the above club has been formed. At the first meeting over forty members were enrolled. The Mayor (Mr. A. W. Guthrie) has accepted the presidency. The programme for the first season embraces all branches of the sport, and social runs and gymkhanas are included. Last month the opening run took place to Cadles, a pretty spot amongst the hills twenty-five miles away from Port Elizabeth.

On the 8th ult. the Captain gave a lecture, which was greatly appreciated, on "Hints, Tips, and Roadside Repairs," at the Grand Hotel, to an audience of over forty members and friends.

## New Zealand Clubs.

The recent trials of the Manawatu Motor Cycle Club went off in a most successful manner, although the unpleasant weather proved a severe handicap to competitors. Some twenty-nine faced the starter. Many of the competitors admitted that it had been one of the stiffest competitions they had competed in, the management enforcing the rules with the utmost stringency. B. Jenkins (Rudge) was responsible for a splendid performance, being the winner in both the open and private owners' classes, thus securing the Rudge and Jarvis Cups, and a trophy. He only lost one mark during the trial, this being due to arriving in Wellington one minute late. W. Passmore (Triumph) was second in both classes, receiving the Dunlop Rubber Co.'s trophy and a gold medal. This rider gained one mark less than the winner, and would have tied with him but for

his footrest being bent before he started, and through his failure to draw the attention of the officials to it it was not noticed until after the trial, when a mark was deducted. R. Burns (New Hudson) was third. Results:

## Petrol. Reliability. Total.

B. Jenkins (Rudge) ...	43.01	99	142.1
W. Passmore (Triumph) ...	39.6	98	137.6
R. Burns (New Hudson) ...	36.5	96	132.5

It would be as well for motorists to note that the address of the New Zealand Motor Cycle Club's Touring Branch has been changed to 290, Lambton Quay, Wellington. Here they can obtain almost any data they require regarding the different routes throughout New Zealand from the secretary of the Touring Bureau.

## Sydney M.C.C.

The reliability trial to Hartley Vale was favoured by good roads. It was a non-stop run at 21 m.p.h. Mr. A. Foy drove the only sidecar. Results: 1, V. H. Page ( $3\frac{1}{2}$  Zenith), lost three points; 2, R. E. Fletcher ( $3\frac{1}{2}$  B.S.A.), lost six points; 3, R. W. Allen ( $3\frac{1}{2}$  Zenith), lost nine points.

## Rand M.C.C.

The Rand and West Rand M.C.C.'s met in a series of team competitions on the 3rd ult., at Mulder's Drift Hill. Results:

## SPEED COMPETITIONS.

Standard Class.—Hodgson (Triumph), West Rand, beat Cutting (Precision), Rand; Thomson (Triumph), West Rand, beat Siems (B.S.A.), Rand; Reynolds (Rudge), Rand, beat Francis (Triumph), West Rand.

T.T. Class.—Merry (Triumph), West Rand, beat Howie (Rudge), Rand; Venter (Bradbury), Rand, beat Vorster (Bat), West Rand; Cuttford (Triumph), West Rand, beat Hodge (Rudge), Rand, who fell while leading; Bright (B.S.A.), Rand, beat Hodgson (Bradbury), West Rand; Flook (Triumph), Rand, beat Robison (Triumph), West Rand.

Sidecar Class.—All four matches fell to the Rand Club, represented by Leyland (Indian), Chater (Zenith), Reckenbarg (Bradbury), and Cutting (Bradbury).

## HILL-CLIMBS.—STANDARD CLASS. m. s.

1. Hodgson (Triumph), West Rand ...	1 42
2. Cutting (Triumph), Rand ...	1 43
3. Francis (Triumph), West Rand ...	1 46 $\frac{3}{4}$

## T.T. CLASS.

1. Flook (Triumph), Rand ...	1 20
2. Bright (B.S.A.), Rand ...	1 24
3. Merry (Triumph), West Rand ...	1 27 $\frac{1}{2}$

The Rand M.C.C. proved to be the victors with 12 points to 7.

## Points in the Design of 1913 Models.

Extracts from a Paper by Mr. Douglas Leechman before the Essex Motor Club.

An interesting paper was read by Mr. Douglas Leechman in the R.A.C. Committee Room, on Thursday evening last, entitled "What I Saw at the Show." Mr. E. M. P. Boileau, *The Motor Cycle*, presided. The lecturer opened his paper by discoursing on the fitting of roller bearings to several important makes of machines, such as the L.M.C., Rudge, Indian, and Sunbeam. He dwelt on the excellent idea employed on the Mark 7 Brown, which had detachable valve seatings. He also mentioned the increase in the number of engines with off-set cylinders, a practice which should be especially valuable in the case of two-stroke motors. He also spoke on the unconventional fitting of the gudgeon pin in the Pope engine, in which the pin is fixed in the connecting rod. It was free to move in and took its bearing from the piston itself. He also dwelt on the fitting of decompressors and "straight-through" carburettors.

## Frame Construction.

It is quite evident that Mr. Leechman's strongest point was frame construction. He showed those present a frame he had had built specially for him. It was of the loop pattern and also had an additional stay running from the top of the saddle tube up to the head, the tube below it running from the former to the bottom of the head and being parallel with the ground. He had also chain stays extending beyond the

bottom bracket, and of these the near side chain stay was very slightly bent to allow for the belt rim.

Speaking of gears, he said he liked the employment on the Hazlewood of the Armstrong as a counter-shaft gear. All the important features found on modern motor bicycles were adequately dealt with. After Mr. Leechman had concluded his paper the Chairman declared the discussion open.

## The Discussion.

Mr. Karslake spoke for some time on the mud-guarding of machines, and showed by means of a clear sketch how the belt was best protected. The discussion was carried on by Messrs. Pratt, Cooper, Simpkin, Thomas, and Gray. Mr. Gray, in his remarks, gave an interesting tip regarding the refitting of roller bearings to the gudgeon pin. He said that before taking the bearing down the top of the crank case should be covered with a cloth in case the rollers fell therein. To re-assemble, the best plan was to have a loose fitting dummy gudgeon pin, place half the rollers in the bearing, then insert the dummy gudgeon pin, and then the remainder of the rollers, the dummy gudgeon pin, of course, being fitted through the piston. When everything was assembled it was then only necessary to push out the dummy pin and put in the proper one and the job was accomplished. The proceedings terminated with the usual votes of thanks to lecturer and chairman.

# AMONG THE ACCESSORIES.

## Clothing.

The well-known firm of Selfridges, Oxford Street, W., have given special attention to the needs of motor cyclists.

Selfridges' motor cycle suit.

They have instituted a motor cycle department, which is shortly to be enlarged, and is run by a manager who is himself a motor cyclist. In this department the clothing section has been given every attention, and we illustrate the latest motor cycle waterproof suit. It is light, but being lined with fleece is very warm. The coat has an efficient storm flap, and the trousers are seated. The legs are provided with inverted pleats and fasten up with buttons. Another novelty is a leather lined waistcoat which has a knitted wool neck and wristbands. The third novelty is a waterproof cap made up of light material. This can be made to fit right over the back of the head and ears and has a large peak. It can be adjusted by tightening an elastic band which encircles the crown.

## The B.C.C. Sidecar.

A novel design of sidecar body with flat bottom, sold by the B.C.C. Co., of Coventry. The front half is permanently covered in.

## Sidecar Cushion.

A pneumatic cushion was exhibited at the Show by the Hutchinson Tyre Co., 70, Basinghall Street, E.C. It

should be ideal for sidecar use. Luxuriously sprung and upholstered as some of these machines are, a pneumatic cushion will still further increase the passenger's comfort and greatly alleviate the fatigue of a long journey.

Service Co.'s route card carrier, which has a waterproof celluloid covering.

Handle-bar watch by Nicole, Neilson and Co., Ltd., makers of the Watford speedometer.

Rotax lamp and generator set. The head light has a large hood.

The Lindum easily adjustable and self-locking pulley.

## Useful Grease Gun.

Ross, Courtney, and Co. are makers of a small grease gun, which we illustrate. It is for injecting grease into greasers, bearings, or any part of the motor cycle that requires this kind of lubrication.

Ross-Courtney's grease gun.

This short grease gun can be carried in a motor cyclist's tool kit.

## A Throttle Controlled Lubricator.

The section of lubricator in annexed sketch is that of a new type of B. and L., which allows of a varied supply of lubricant according to the engine and amount of throttle opening. The feed and carburetter throttle lever are inter-connected so that more or less opening of the latter affects the former.

## Spring Frame

The Oakleigh Motor Co., of 65a, Rosendale Road, West Dulwich, S.E., are making a special strong bicycle frame for heavy sidecar work. This has a sprung back wheel and large upholstered pan seat placed on springs. Instead of the usual single tube in front the frame is built up with double tubes, and the top tube is strongly braced to the top of the ball steering socket.

A type of Best and Lloyd oil pump, the drip feed of which is interconnected with the throttle lever.

## A Ribbed Non-skid.

Gaulois tyres have now been on the market some years. The firm's latest type of cover for motor cycle or sidecar work is known as the "Triple Stripe."

We illustrate this pattern, which is made in practically all sizes, with grey or white tread, and should prove an efficient non-skid. A steel studded cover as well as butt ended tubes are also sold by Gaulois Tyres (1909), Ltd., 6, Bath Street, City Road, E.C.

Section of the Gaulois triple stripe cover.

# AIR-PROPELLED MOTOR CYCLES.

The Pros and Cons of an Ingenious System.

By W. G. ASTON.

**W**ITHIN the last few months there has been a good deal of talk and quite a stir in some sections of the daily Press in regard to a certain "winged motor car" which attracted the attention of Fleet Street by accomplishing a run of a few hundred miles in France, and which was hailed as an entirely new thing. Of course, it was not a "winged motor car" at all, but merely an apparatus which is commonly known as a "wind waggon," and is practically an aeroplane without wings; that is to say, the tractive effort is provided by an aerial screw propeller instead of being applied directly to the driving wheels.

This sort of thing is as old as the hills; there are, and have been for years, quite a number of them in various parts of America; there are also a few in France, and there are at least two full-sized ones in England, and they are generally used by manufacturers of aeroplane propellers or engines as testing machines.

The fact that they can travel with remarkable smoothness at high speeds, that they are also good hill-climbers, and, as motor vehicles, are characterised by extraordinary simplicity, has led not unnaturally to the supposition, and even in some quarters to the deliberate statement, that they are the forerunners of a new type of motor car in which practically all the inherent disadvantages of the present type will be overcome at one stroke. This sort of prediction is to be taken very much *cum grano salis*.

One wishes one could say, as a contributor to *The Autocar* recently, that all such troubles would be put an end to by merely coupling the engine up to a screw propeller. This, alas, is hardly true, still one never knows what may happen, what new discoveries may be made, and what new and more efficient forms of air propellers may be devised. It would, therefore, be very unwise to say that the air propulsion principle can be dismissed as so much "bunkum," but it is quite safe to say at the present time that it stands very little chance of regular adoption, inasmuch as its disadvantages very greatly outweigh its advantages.

## The Advantages of Air Propulsion.

First let us glance at the advantages of air propulsion. These may be roughly classified as follows: (1) Simplicity, (2) cheapness, (3) absence of skidding, (4) greatly reduced wear on tyres, and (5) easy gliding motion. These require some little explanation.

Essentially, the air-propelled motor cycle consists of a bicycle to which is fixed a motor and a screw propeller; this means that no transmission strains are applied to the frame of the machine or to the wheels and tyres, hence all of these may be extremely light—ordinary "push cycle stuff" would certainly be strong enough for general purposes, as only the road strains have to be considered.

It is, of course, principally in this respect that cheapness of production can be attained. A first-class bicycle to form the basis of the machine, and perhaps strengthened all round a little, and shod with good-sized tyres, should not cost more than £12 at the outside. A 5 h.p. engine with direct coupled propeller ought not to exceed £22, bringing the total to £34.

## Freedom from Side-slip.

For ordinary purposes 2in. tyres would probably be ample. Incidentally to the rolling action of the tyres comes the freedom from skidding, which is justly regarded as one of the principal advantages of the air propulsion method. It is, or should be, well known that a wheel which, like the front wheel of a motor cycle, merely rolls over the road surface exhibits far less tendency to sideslip than does one which is being forcibly driven or being braked.

With the air-propelled motor cycle, the speed of which would be checked by brakes on the road wheels as well as by the engine control, the ordinary tendency to skid would, of course, be exhibited just the same were the brakes to be applied harshly or suddenly, but in ordinary running it is safe to say that so far as road grip is concerned, corners could be taken at a speed much greater than is at present possible.

Not least of the favours which air propulsion has power

of bestowing is the beautiful easy gliding motion which it imparts to the machine. There are absolutely no transmission shocks, since the resistance against which the propeller reacts in order to thrust the machine forward is fluid air, which is an ideally elastic medium.

This, in a way, carries its own disadvantage with it, for it means that very rapid acceleration cannot be obtained when it is wanted. The throttle may be opened with great suddenness, but the effect of the increased power upon the machine would be felt far less rapidly than with the present positive system of transmission. There would likewise never be any opportunity for the engine to "konk out," as its load, namely, that due to the mere rotation of the propeller, and not directly the propulsion of the machine, is a more or less constant one, or, at all events, decreases with lessened engine speed. A positively driven machine ascending a hill of progressive gradient imposes a greater and greater load upon the engine, as the revolutions of the latter become less and less, hence the power falls off as the resistance increases. With the air-propelled motor cycle exactly the opposite is the case, for the power can remain, if desired, at its maximum under all conditions, whilst what is even more important, the thrust of the screw propeller becomes greater and greater as the speed of the machine decreases. As the machine goes forward and increases in speed, less and less air is deflected backwards, hence the thrust becomes less and less proportionately. If one could obtain a propeller of perfect efficiency, namely, one in which there was no slip at all, it would continue accelerating the machine until its speed were such that the screw blades were working as positively as a bolt works in a nut. Such a propeller is, needless to say, quite impossible, and hence no air-propelled machine could ever reach the theoretical speed of the screw which drives it. There is, and always must be, a certain amount of slip; if not, it would be impossible to turn the propeller round, no matter at what speed, without causing the whole machine to progress a certain definite distance.

## The Disadvantages Explained.

Let us now glance at the other side of the picture. Right away from the beginning it is necessary to say that the disadvantages outweigh the theoretical benefits by a very great deal. They will be dealt with in a similar manner to the latter, and are categorically more or less as follows: 1, large size of propeller; 2, slow acceleration; 3, effect of torque; 4, necessity for transmission; 5, effect of wind; 6, necessity for protecting screw; 7, dust raising; 8, effect of gyroscopic force; and 9, necessity for multi-cylinder engines.

The first item, namely, size of propeller, is a matter of great importance, possibly more so than any other when one is considering two-wheelers only.

A propeller 3ft. in diameter and 4ft. 6in. in pitch should at 1,500 revolutions per minute be capable of driving the machine (of which the resistance to the air is assumed to be small) at a speed of just on 60 m.p.h. The engine power necessary for this would be 5 b.h.p. (This statement does not represent a mathematical calculation, but is deduced from results obtained with actual propellers.)

The thrust given by the propeller when the machine is stationary would be, roughly, 50 lbs., whilst at various speeds the running thrust would be approximately as follows:

At 30 m.p.h.	... 31 lbs.	At 50 m.p.h.	... 18 lbs.
„ 40 m.p.h.	... 24 lbs.	„ 60 m.p.h.	... 15 lbs.

It will be noticed that when the maximum speed is obtained the thrust is so small that the machine and its rider would have to be of very small air resistance indeed, to say nothing of the friction of the rolling wheels. To assume that 60 m.p.h. is within the capacity of a machine of this type is undoubtedly very optimistic, and it has only been taken as representing the best possible case for comparison.

Now a 5 h.p. twin motor bicycle in anything like tune should easily be capable of a mile a minute, so that a rough comparison can easily be made.

### Air-propelled Motor Cycles—

So far as the present design of air propellers goes, no claims for high efficiency can be made for them. With a direct driven, or, at any rate, a high speed propeller of small diameter, such as would have to be used on a motor cycle, the efficiency could not be expected to be more than about sixty per cent., which is undoubtedly considerably lower than is to be obtained with a transmission of the usual type.

#### A Screw Three Feet in Diameter.

The screw I have suggested above, namely, 3ft. in diameter  $\times$  4ft. 6in. pitch, would unquestionably be relatively inefficient owing to its high speed, but I certainly do not see how a larger one could very well be used. By increasing the diameter, decreasing the pitch, and keeping the speed the same, the thrust per h.p. could be increased, and from an aerodynamic point of view this would be advis-

FIG. 1.

able, but it is impracticable for this reason, that the machine would require nearly as much lateral space on the road as a small car, and its usefulness would thereby be considerably destroyed. The 3ft. diameter is clumsy enough in all conscience, especially as the screw would have need of very complete protection, but it is conceivable that such a machine could be negotiated through fairly heavy traffic.

Let us now consider what a machine so equipped should be capable of in the way of hill-climbing. From the above figures relating to screw thrust, it is clear that if the machine and rider weigh together 200 lbs. (they will be almost sure to exceed this figure), a hill of 1 in 8 could not possibly be climbed at more than 33-35 m.p.h. Allowing for any frictional losses in the machine itself, a gradient of 1 in 12 could not be taken at more than about 26. Bearing in mind that these figures do not take into consideration the power absorbed in wind resistance, it will be seen at once that they compare not at all favourably with the existing records of positive transmission systems.

The above machine should be just capable of climbing a hill of 1 in 4½, but at an exceedingly slow rate of speed.

Point No. 2 deals with slow acceleration, which might perhaps have more properly been designated as "Lag."

As everybody knows who rides a modern motor cycle, one has only to open the throttle to dart forward, acceleration being very rapid indeed. Inasmuch as the transmission is not positive in the air-propelled machine no such instantaneous response is to be expected. Upon opening the throttle the engine would certainly accelerate, and the propeller thrust be accordingly increased, but the inertia of the machine would prevent it from getting away with a bound; in other words, whilst it might accelerate to the same speed over a given distance, it would get on the move much more slowly. The reason of this is that in the one case there is no slip at all, and in the other there is a great deal. Indeed, for practical purposes the aerial propeller may be regarded more or less as a slipping clutch.

### Two Alternative Types of Wind Motor Cycles.

In sketches I and 2 I have made rough suggestions for alternative types of air-propelled motor cycles. The first is a very obvious sort of arrangement. The affair is practically a pedal cycle frame and wheels with an extra strong luggage carrier, upon which is mounted an engine direct coupled to a propeller. It is, of course, simplicity itself.

In the second sketch another design is given in which the propeller is in the same place, but the engine is much lower

down, the transmission between the two being by means of a chain. To the uninitiated it would appear that the two designs were practically the same, but in reality this is far from being the case; the distinction hinges on the matter of torque, which has been mentioned as disadvantage No. 3.

In the first design the tendency for the torque of the engine is to twist the machine about the axis of the propeller-shaft. This might quite possibly, on greasy roads, be rather a serious matter when the engine was opened up with some suddenness.

In the second design this torque is got rid of by employing the chain drive, and no such twisting tendency exists. The latter is, therefore, the better design of the two, which brings us to the fourth disadvantage, viz., necessity for transmission.

It will be realised from what has been said before that unless a direct drive of the screw can be employed one of the greatest claims of the air propulsion idea falls to the ground, and especially so as in view of the poor efficiency of the system one cannot afford to be negligent of one's power. I do not suggest that a well-protected chain drive would make a great difference to the efficiency of the plant, but the difference, slight though it might be, would be there none the less.

It may be asked on glancing at the above figures, "Why not put the screw in front?" The answer to this is that if so the rider would have the whole of the slip-stream directed into his face, so that if he were climbing a steep hill at a walking pace he would be as much blown about as if he were doing a mile a minute on the level.

Another advantage of having the propeller behind is that in this situation it stands a chance of recovering a certain amount of lost energy by working in the frictional wake of the rider's body.

### Wind Effect.

We now come to wind effect, and in regard to this it is almost true to say that alone it is enough to blast the prospects of air propulsion for good and ever. As a case in point. A 60 m.p.h. air-propelled machine could only do 35 m.p.h. against a 25 m.p.h. wind, which, during spring and winter, is a thing quite frequently met with; indeed, during these seasons winds of this speed are almost the rule rather than the exception. Gusts of much higher speed almost frequently occur, and these would have considerably more effect upon an air-driven machine than upon an ordinary mount. It is true that when the wind is behind the rider his speed would be proportionately increased, but this by no means makes up for the fact that he would always be entirely at the behest of the wind for his distance and average speed. The ideal condition for the suggested machine would be, of course, a perfectly calm day.

The next point, which deals with the necessity for providing adequate protection to the rapidly revolving propeller, scarcely calls for any enlargement. Certainly the cage in which it rotates must be strong enough to prevent it being

FIG. 2.

smashed in case of the machine falling over, and it must likewise be a very complete one in order to prevent enquiring persons from having their fingers cut off. Owing to its enormous peripheral speed, the propeller is in effect as weak and brittle as a biscuit. A pebble hung up by the back tyre would be quite sufficient to splinter the blades if it were allowed to strike them, and this point would therefore require careful attention.

One inevitable result of fitting a really protective guard would be, it may be added, an immediate means of reducing propulsive efficiency.

With regard to point No. 7, it has been said that air propulsion for motor vehicles would practically solve the dust

# THE POETRY OF MOTION

When it is remembered what a wonderful little machine was the 1 $\frac{1}{4}$  h.p., it will be well imagined what the 3 $\frac{1}{2}$  h.p. Twin will be capable of accomplishing. With the admirable 2 $\frac{1}{2}$  h.p. Motosacoché, the Gentleman's machine, with change-speed gear and free engine, and the 3 $\frac{1}{2}$  h.p. machine, both second to none, we have motor cycles to meet the requirements of all.

## The Question 'WHICH IS

## THE BEST TYRE' ANSWERED.

Read the following comment by Major F. Lindsay Lloyd, the judge of the Tyre and Belt Trials held in conjunction with the A.C.U. Six Days' Trials:

The prize referred to is, of course, the "Motor Cycling Cup" for the Best Tyre Performance, awarded to the Palmer Cord.

The condition of the set of tyres (Palmer Cords) to which the prize has been awarded was undoubtedly better at the conclusion of the Trial than that of any other set under my observation. In fact, except for the tyre mounted on the driving wheel, it would have been difficult to say that the covers had been used at all, and on the driving wheel cover itself, except for very slight markings on the outstanding rubber ribs, there were practically no indications of wear.

6 out of 7 riders of PALMER TYRES gained 6 gold medals and 4 cups. The 7th failed through mechanical trouble.

The 3in. Cord Tyre can be supplied from stock. Write for list.  
THE PALMER TYRE LTD., 119 121, 123, Shaftesbury Avenue, LONDON, W.C.  
Motor Cycle Tyre Dept. 103, St. John Street, Clerkenwell, E.C.

# PALMER

In answering these advertisements it is desirable to mention "The Motor Cycle."

# The NEW CLINCHER "FLEXIS" MOTOR-CYCLE BELT

Size

$\frac{15}{16}$  in.

for  $\frac{7}{8}$  in.  
Pulleys.

Price

2/-

Per  
Foot.

CLINCHER "FLEXIS" MOTOR CYCLE BELT.

MANUFACTURED BY THE NORTH BRITISH RUBBER Co., Ltd., EDINBURGH.

The Clincher "Flexis" Belt is designed to give extreme flexibility and mileage. It does not stretch and can be used slack without danger. Particular notice is called to the SIZE  $\frac{15}{16}$  in., as this will better suit the  $\frac{7}{8}$  in. pulley than the ordinary  $\frac{7}{8}$  in. belt. Tests have absolutely proved it to be the best belt on the market.

## Air-propelled Motor Cycles.—

problem. This is the truth, but not by any means the whole truth. As a matter of fact, it is true only provided that such motor vehicles are always travelling at their maximum speed, and in this event the dust they would raise would certainly be relatively slight. Unfortunately, the presence of a high speed blast of air from the screw when the machine was starting from rest, or climbing a hill, would cause dust to be raised in prodigious volumes.

In discussing multi-wheelers, viz., vehicles of which the stability is assured, it is not necessary to consider very seriously the effect of the gyroscopic force produced by the revolving propeller, but in single-trackers this matter is not to be lightly dismissed. It is quite unquestionable that taking sharp corners with full power would require most certainly great skill, and possibly enormous muscular strength, in the rider.

The necessity for using with an air propeller a multi-cylinder engine will, I imagine, be rather obscure, except to those readers who take a lively interest in aerodynamics. Briefly the reason is as follows:

For it to give maximum efficiency a propeller must be subjected to a constant driving torque. If its angular speed be not constant, as would be the case if it were driven by an ordinary single-cylinder engine, it would give a thrust of slightly varying strength. This variation in thrust might be met by a synchronised variation in speed of the machine, but this is prevented by its inertia. Such being the case, the effect of the varying thrust is to deform the propeller blades by slightly bending them out of pitch. In consequence of this, the air resistance of the propeller blade is increased, and its efficiency accordingly very adversely affected.

## THE TRANSMISSION CONTROVERSY.

I should like to answer "Ixion's" summing up of this controversy. The main features about his article appear to be that he knows very little about chain drive, and that the chain drive has not even a single advantage over the belt. Yet he is willing enough to admit that by the adoption of the front chain to take the hardest part of the drive to relieve the belt, and by shortening the belt, so making it harsher, you get an improved drive.

I notice also that he still claims that popularity proves the superiority of the belt drive. But, according to the popularity idea, I suppose that no improvement is superior to the old article until it has become popular!

He writes some pointed remarks about the public, press, and trade in his final arguments, and with all of which I agree in certain respects. Each accusation applies to a small portion of these individuals. Generally speaking the trade supply what they can sell best, and that which is cheapest to make. The belt drive *me judice*, has only two advantages over the chain drive—that is the direct belt with adjustable pulley and the chain drive with the slip clutch or efficient shock absorber. Firstly, it is cheaper to manufacture. Secondly, being able to alter the gear to any ratio more easily has given the belt an advantage in hill-climbs and races, where conditions alter at the last moment. The belt, although it has a short life, has a life long enough for a hill-climb, or short race between adjustments, and for long distance races the practice of carrying one or more spare belts proclaims to the world its unreliability. These two advantages have been the cause of the belt's popularity.

Nevertheless, the P. and M. lived through it all, because their drive can equal the belt in all points except cheapness of manufacture and ease of ratio change, but could always beat the belt in reliability and cheapness of upkeep. The belt has been improved many times, but is now absolutely out of keeping with the general reliability and durability of the modern machine, and always will be, unless motor cycles deteriorate.

Taking "Ixion's" points in favour of the belt, his arguments that it is cheaper to make and lighter, although quite true, carry no weight against its unreliability. "It is easier to repair and adjust and cleaner to handle." As for repairing it entirely depends on the break in either case—one might be more difficult than the other, but when one considers that the chain very seldom breaks and the belt often does, the chain becomes preferable.

When the rate at which the screw receives impulses corresponds with, or is a simple multiple of, the spring period of the blades themselves, a steady flutter will be set up which would reduce the efficiency enormously. To overcome this difficulty, either the propeller must be driven through a reduction gear of big ratio, or enormously heavy flywheels must be fitted to the engine, or a multi-cylinder stationary engine must be used, or a rotating engine of the Gnome type. The first alternative is, as we have seen above, impracticable on a road vehicle, because it means that the propeller must be very large. The second is highly undesirable, because it would destroy the liveliness of the engine, which, as has been pointed out, is already seriously discounted by the nature of the drive. The third and fourth alternatives are the only available ones, but it need hardly be said that in either case they would result in the price of the machine going up to a pretty high figure.

### Two and Other Wheeled Wind Motor Cycles.

In this article I have admittedly been considering two-wheelers only. It need hardly, however, be pointed out to advocates of air propulsion for cyclecars that practically every one of the arguments holds as good for one type of machine as the other. As a matter of fact, the cyclecar is even worse off than the motor cycle, because it weighs more per unit of power. Large propellers being barred, it must therefore cut a poor figure on hills, unless, of course, the power available is very large. I estimate that a 20 h.p. air-propelled four-wheeler would on an all-round basis be about comparable to a positively-driven machine of 8 h.p.

There are, by the way, one or two other disadvantages I might mention, but those I have dealt with should be sufficient. I have tried hard to add to the number of benefits, but without success. Perhaps some screw enthusiast can do so.

"Ixion" states that the belt is safer under certain circumstances. What circumstances? His other remarks about "duffer drivers," "smoothness," "steadiness on grease," and "livelier engines" only apply to the badly designed chain drive without a slip clutch or shock absorber of any sort. "Ixion" will agree that the Indian, A.J.S., Scott, or J.A.P. engines used with chain drive are just as light and lively as engines used on belt-driven machines, and wear as well and as satisfactorily. The P. and M. and Clyno engines, of which "Ixion" is probably thinking, are low compression engines, not because the machine is chain-driven, but because the type of engine has many advantages for steady touring and everyday riding.

Now, turning to the mongrel drive—the combined belt and chain. This loses the two advantages of belt over chain. It is as expensive as the chain drive to manufacture (it is as heavy, too), and it loses the adjustable pulley, besides shortening the belt, thereby making it harsher and less flexible. It still retains the slipping of the belt, and still has belt fastener troubles. The former of these is, of course, improved, but the flexibility of this drive is not as good as that of the direct drive, since the belt is shorter, and, consequently, has to run a little tighter. My original points was and is, since the combined drive has no advantages over the chain, why retain the belt. It has the disadvantages of belt slip and breakage, requires more looking after, and the belt has a shorter life than the back chain. Its efficiency is less, and its smoothness of drive variable. Once a slip clutch has been properly adjusted it remains adjusted for a year or two and does not vary. "Ixion" loves the word "belt"; it has some magic charm for him, but it should not make him blind to the fact that in whatever form you have the belt drive, it is inferior in durability and reliability, and requires more looking after than the chain does. So soon as the shaft drive is fitted with a satisfactory slip clutch mechanism this drive can compete with the chain, but will always be more expensive, although it has the advantage of "weatherproofness."

I notice in the "Buyers' Guide" fifty-five models of chain-driven machines are listed (five with optional chain or belt), and only twenty-two combined drives. I wonder if "Ixion" will back this state of affairs up by his popularity fallacy, and admit that the chain drive must be better than the combined drive, or will he agree with me that popularity proves nothing?

THOMAS F. MAW.

# QUESTIONS and REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Tyres Giving at the Bead.

?

I have ridden my 1912 T.T. machine 5,100 miles, and in that distance have worn out, on back wheel, three outer covers besides half wearing out another two.

The covers all go at the bead, though there is nothing that the garage can find wrong with the rim. (1.) Can you suggest any possible faults or means of remedy? (2.) A tyre liable to stand the strain better. (3.) Would the trouble be obviated by converting wheel to wired-on? (4.) Are there any objections to wired-on covers? (5.) Would the conversion cost much?—W.P.

(1.) We should say that the cause of the trouble is high speed, and the size of the tyre fitted is not up to the work. Perhaps, also, you do not inflate the tyres sufficiently. (2.) Try a heavy cover of any first-class make. (3.) Possibly; but special rims are required for these covers, and they are not so easily detachable. (4.) There are no objections to wired-on covers; many riders prefer them; but they are not so general. (5.) The cost of conversion can be obtained from the tyre makers, who would give you a quotation for new rims.

## Easy Starting.

?

I have great difficulty in starting up my 8 h.p. twin Dot, which has a handle starter. I cleaned out the stale oil from the bearings lately, and this improved it, but did not cure it. (1.) Would the fitting of decompressors cure the trouble, or can you suggest some other remedy? (2.) The cylinders are rather badly carbonised; would this have any effect on starting? (3.) When the engine is running free it races at a fearful pace. Would this also be remedied by decompressors, or is it the fault of the carburetter? (4.) I would be pleased if you could tell me if there are any silencers on the market which can be attached to the sidecar and connected up to the silencer on the cycle by means of flexible connections. —NANTON.

(1.) The fitting of decompressors would considerably assist matters; also the flooding of the carburetter before starting. (2.) We would recommend you to free the cylinder head and piston of carbon deposit. (3.) If the engine races when it is running free, it shows that the carburetter is not adjusted for running at slow

speeds. The fitting of an automatic carburetter, such as the Lukin, Binks, Stewart-Precision, Brown and Barlow, or other good make, would make a wonderful difference to the running, and the fitting of the decompressors would help the machine as regards easy starting, and also as regards slow running as well. (4.) Yes, any silencer could be fitted up in this way. There were several examples of this method of attachment shown at Olympia.

## Taxation of Carrier Motor Cycles.

?

I have a 3 h.p. motor cycle and I have fixed a permanent carrier and basket behind with the intention of getting exemption from licence. I made application here (Blackpool) and took my machine to the town hall for inspection, also saying I would paint name, etc., on plates. The borough treasurer said he had not heard of a motor cycle getting exemption, but if I could get to know whether there were any such cases he would be very pleased to consider my request.—C.J.P.

What we should advise you to do is to refuse to take out a local taxation licence, stating that your machine is used solely for business purposes. On the other hand, you must be prepared to swear

that the machine is not, and will not be, used on any occasion whatsoever for other purposes than the delivery of goods and merchandise. In the event of your being prosecuted, if you are a member of the Auto Cycle Union (89, Pall Mall, S.W.), or any club affiliated to it, their Legal Department will defend you free of charge. The only case, which was recently referred to, which the A.C.U. took up they had to drop because it was stated in court that the applicant had used the motor bicycle on one or two occasions for pleasure purposes.

## Misfiring on Pilot Jet.

?

Will you kindly say what is the cause of my 7 h.p. two-speed Indian (1912) misfiring on the pilot jet? It has run about 2,200 miles, and the misfiring developed after 1,500 miles. The jet and carburetter have been taken down and thoroughly cleaned. The exhaust valves have been refaced, but the inlets were not touched. No new springs have been fitted. I know three similar machines which have shown the same trouble and we cannot remedy it.—J.L.W.

Misfiring at low speeds may be due to a variety of causes. Carburetter: Jet choked, petrol supply intermittent, too much air (possibly caused by a leak at the union). Magneto: Platinum points want refacing and cleaning, contact breaker sticks, carbon brush and ring want cleaning. Plug: Points too far apart or very possibly too close together.

## Inland Revenue Tax

?

In your handbook you state that the Inland Revenue tax of £1 has to be paid within twenty-one days after putting the machine on the road. I conclude from that that one can keep a machine for an indefinite time without paying the tax if one does not ride it. Also, as I am buying a bicycle soon, if I bought it on or after the 11th of December, would I then avoid the payment of 10s. tax for the remaining part of this year, as this date will be within the twenty-one days limit.—P.G.

You can keep a machine without an Inland Revenue licence so long as you do not use it. If the machine is used the tax immediately becomes payable, but you are allowed twenty-one days grace. Therefore if you first use your machine on December 11th, the tax 10s. becomes due on January 1st, and this licence must be renewed for 1913.

The Lindum Spring Fork—This should be particularly suitable for sidecar machines as the large ball bearing at the top prevents lateral movement.

## Compensation for Injuries.

?

(1.) I ride a motor bicycle for my employers. In the event of an accident whilst on the bicycle, can I claim compensation for personal injuries from my firm? (2.) Can I drive a motor car whilst holding a licence to drive a motor cycle? (3.) What should be the highest gear on a  $2\frac{1}{2}$  h.p. machine with an Armstrong three-speed? I only weigh about 9 stones. (4.) Is it possible to use too large a belt on a motor bicycle, even though it fits in the engine pulley? For instance, an inch belt on a  $2\frac{1}{2}$  h.p. model. (5.) Is it advisable to "treat" rubber belts in any way? (6.) Would there be sufficient exhaust from a  $2\frac{1}{2}$  h.p. single-cylinder to blow an exhaust whistle that had not a valve in the exhaust pipe?—DY 435.

(1.) Our answer to this question is in the negative, unless your salary allows you to be treated under the Workmen's Compensation Act. (2.) No, but if you hold a car licence, which costs the same, you may drive a motor cycle. (3.) We should say about  $4\frac{1}{4}$  to 1. (4.) The larger the belt, the more power is absorbed. A  $\frac{3}{4}$  in. belt should be quite big enough for the machine you are using. (5.) It is not necessary to "treat" rubber belts. (6.) Yes, the exhaust should blow a low pressure whistle.

## Transmission on Cycle Cars.

?

As a regular reader of *The Motor Cycle* of three years' standing, I venture to ask you for information on the following points with regard to friction drive for cycle cars: (1.) If the driven friction wheel or disc be fixed on the back axle, and the driving disc be fixed on a shaft continuous with the engine-shaft, what do you consider should be the diameter of (a) the driving disc and (b) the driven disc? (2.) If the driven disc be fixed on a counter-shaft and connected by chain to the rear axle, what should be the diameter of (a) the driving disc and (b) the driven disc, and what reduction in gear should the final chain drive give? (3.) Of what material should the friction discs be made, and do you consider plain or ball bearings the best for carrying them? (4.) What should be the thickness of the disc where it makes contact at its edge? (5.) Do you consider friction drive quite satisfactory for a light cycle car with an 8 h.p. air-cooled engine, or would you prefer a direct top drive by chain, and friction drive for the lower gears only? (6.) Is friction drive quite satisfactory when climbing hills? (7.) Can you tell me the percentage of the brake-horse-power of an engine which should reach the road wheels, assuming full efficiency—(a) by direct belt drive, (b) by direct chain drive, (c) by chain drive and epicyclic gearing on low gear through one set of pinions, and (d) by friction drive?—P.P.

At all times we are willing to answer queries regarding the handling and control of motor cycles, but replies to queries regarding manufacturing problems are somewhat without our province. (1.) As a matter of fact, it would be impracticable to run a car with friction wheel on back axle and driving disc on shaft, unless diameters were tremendously disproportionate. (2.) The approximate diameter

of the driven and driving discs in the case of counter-shaft friction drive, 18 in. driven and 12 in. driving; see illustrations of G.W.K. drive, also Violette friction drive in our issue of Nov. 14th, page 1317. (3.) The disc is made of cast-iron, and the friction wheel is made up of compressed paper, held between side plates. Ball thrust bearings should be used. (4.) The thickness of the friction disc can only be determined by experiment. (5.) If friction drive be adopted there is no necessity for a direct top drive by chain. (6.) Yes; quite satisfactory if properly designed. (7.) We cannot answer this question with any exactness, as so much depends upon the condition of the various parts and their lubrication, but you may take it that the following are approximately correct: (a) 15% to 20% loss; (b) 2% to 5% loss on each chain; (c) 10% loss on each train of gears; (d) 20% to 30% loss.

## Tuning and Timing.

?

My machine is fitted with  $3\frac{1}{2}$  h.p. twin Peugeot engine, Amac carburetter, and Bosch magneto. will you help me out of my trouble which is: (1.) When running engine on the stand for thirty seconds the back cylinder gets so hot that I cannot touch it with the hand. The silencer is quite clear, and the piston is getting a fair amount of oil. (2.) The front cylinder I cannot get to fire at any time. The spark is good and also the compression, the inlet and exhaust valves work quite freely, and the carburetter appears to be all right, and the engine is thoroughly clean. (3.) You might also tell me how to time my engine. (4.) How to alter the timing when the magneto is chain-driven. (5.) Is a gear 5 to 1 too small for my engine (my weight  $9\frac{1}{2}$  stones), and how many miles per hour should I get out of the machine on the flat? (6.) Is the Amac carburetter a good one, or do you recommend some other make?—Q.E.D.

(1 and 2.) If you run the engine on the stand you must not be surprised if it gets exceedingly hot so that you cannot touch it. This is not an abnormal heat for an air-cooled engine. Of course, if the exhaust valve springs are weak, causing the valve to close late, it will affect the power, etc., of the engine. The fact that the front cylinder does not fire is probably due to the carbon brush conducting the current from the magneto to the front plug being broken or not making proper contact. Try changing the plugs. (3.) You time the engine as follows: Retard the spark, and set the platinum points to break when the piston is on the top of the compression stroke. The exhaust valve should be set to close when the piston has reached the top of

the exhaust stroke or just a shade later. (4.) You will probably find the chain wheel on your magneto fitted with a cone. The nut should be removed, leaving the wheel free to move on coned end of armature-shaft, when the timing can be altered to suit your requirements. (5.) Try gearing a little higher, say  $4\frac{1}{2}$  to 1. You should be able to get 40 m.p.h. on the flat with this machine. (6.) The carburetter referred to is a good one.

## Tyres and Nominal Horse-power.

?

(1.) Is a wired-on tyre likely to creep? If so, are there any means of preventing same? (2.) How is it that some engines  $85 \times 85$  are  $3\frac{1}{2}$  h.p. and others  $85 \times 85$  are 4 h.p.; what is the difference? Kindly explain.—X.Y.Z.

(1.) No; wired-on tyres are not at all likely to creep if kept properly inflated. (2.) The horse-power is reckoned according to the makers' own ideas. Probably every  $85 \times 85$  engine gives well over 4 h.p. A modern engine should give at least 1 h.p. for every 100 c.c. capacity. The nominal horse-power is no guide at all.

## READER'S REPLY.

I notice in *The Motor Cycle* for November 21st that you advise "V.C.B." on the way to Weymouth after Birmingham. As I have done this many times, and have been over the route you suggest, I hope you will not mind if I suggest another which I have found, from experience, is far better. The best way from Birmingham to Dorchester (Hants) is as follows: Birmingham, Bromsgrove, Worcester, Tewkesbury, Gloucester; follow the Bristol Road six miles out, take the left road to Stonehouse (the directing post says Stroud, but it is not necessary to go to Stroud, as you pass by it and avoid the hill in Stroud, and it is also shorter, therefore turn sharp right at Dudbridge, one and a half miles from Stroud, straight to Stonehouse). Then on to Tetbury (not to Minchinhampton; Minchinhampton is on top of a tremendous hill, almost the highest point of the Cotswolds), Malmesbury, Chippenham, Melksham, Westbury, Warminster, Gillingham, Sturminster, Newton, Pulham, Buckland Newton, Piddletrenthide, Dorchester, to Weymouth. You will find the last part of the route is different from yours, which is actually, except Bridport-Lyme Regis Road, the most hilly road in Dorset, and I know it well. Shaftesbury itself stands on a hill and Blandford to Dorchester is also hilly. On the route I have given you there is only one hill, and that is easy, between Stonehouse and Tetbury. I was over it a fortnight ago, and it is quite the best.—W. E. DENSLOW.

## EXPERIENCES WANTED.

"L.S." (Streatham.)  $3\frac{1}{2}$  h.p. Kerry Abingdon two-speed with and without sidecar. Also Alldays, Matchless, and Roc gears.

"C.B.M.B." (Huntingdon.) Morgan runabout, reliability and stability in grease; also  $3\frac{1}{2}$  h.p. Green-Precision and 6 h.p. air-cooled twin for sidecar.

"W.W.H." (Bromley.) 1912 Scott. consumption, chain adjustment, and running costs.

"G.M.N." (Walsall.) 1912 Scott, reliability, consumption, and hill-climbing, solo and with sidecar.

## "The Motor Cycle" Photographs.

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates:—Unmounted prints, half plate,  $1/6$  post free; mounted,  $1/9$  post free. This refers only to photographs taken by "THE MOTOR CYCLE."

Orders, which must be accompanied with remittance, should be addressed to the Photographic Department—Life and Sons Limited, 20, Tudor Street, London, E.C.

### A Spring Seat Pillar.

The saddle is carried on the usual pillar A sliding in a socket B, which is formed integral with a tube C provided at its lower end with a guide plate D, which is slotted to pass round a bolt E secured to the cycle frame by a clip F. The tube C is therefore free to slide vertically, but under the restraint of springs GH. These springs are threaded around a rod J having an abutment K at its lower end for the spring H, the tube C having an internal collar L acting as an abutment for both springs. The rod J is attached to the saddle-pillar bolt M, and the springs GH are arranged nearly to balance each other so that the saddle is not removed excessively when its load is removed.—W. Hunt and L. Masters, No. 1,309 1912.

### A Two-speed Gear.

The gearing is carried between two plates AB, which can be bolted to the

### The Albion Gear.

We are asked to state that the Albion revolving counter-shaft gear, described in our last issue, cannot be delivered until the middle of January. The correct title of the firm is the Albion Engineering Co., Ltd., Tower Works, Upper Highgate Street, Birmingham.

### Two-speed Hub Gears.

Those readers who were unable to examine the Lake and Elliot Millennium two-speed hub gear at Olympia can inspect the gear in running order at the London showrooms, 14a, Great Marlborough Street, Oxford Street, W. Mr. G. H. Smith is in charge here.

### Paris Salon.

We are informed by the organisers of the Petit Salon (Paris), which will open on the 14th inst. and close on January 3rd, that the price for space is 40s. per square metre, with a share in the profits. The organisers are prepared to find competent persons as stand attendants for the sum of 6s. a day. All correspondence should be addressed to the Manager, 2, Rue Blanche, Paris.

Showing details of Smith & Son's speedometer drive.

frame. The gear drum C is mounted in ball bearings in the plates AB, and is provided with spindles for compound pinions D, engaging corresponding pinions EF on the driving and driven shafts GH respectively. On the driving-shaft G is mounted a chain sprocket J driven from the engine, and the driven-shaft H is provided with a sprocket K transmitting the drive to the road wheel. Also upon the driven-shaft is screwed a clutch drum L, engaging clutch segments M carried by the driving-shaft. These segments are expanded by a taper rod N, operated by mechanism not shown, and when in full engagement with the drum L, the driving and driven-shafts are locked together and a direct drive obtained. The clutch drum C is surrounded by a band brake (not shown), which is engaged to hold the drum stationary for the low gear. The drive is

then from the sprocket J to the shaft G, pinion E, compound pinions D, and thence to the pinion F, driven-shaft H, and sprocket K. The driving-shaft is pro-

vided with a gear wheel O, engaging a toothed sector for starting purposes.—G. Wray, No. 24,801, 1911

## SPARKLETS

### British Motor Cycles in Canada.

Despite what has been said to the contrary, British motor cycles are rapidly gaining favour in Canada. The Matchless agent in Toronto, Mr. W. J. Porter, has just made an extensive tour on an 8 h.p. Matchless sidecar combination, and excellent business has resulted. Incidentally, Mr. Porter mentions that he has been agreeably surprised at the manner in which his machine has negotiated the very roughest roads which it has been necessary for him to traverse. The writer then goes out of his way to compliment *The Motor Cycle* on the large circulation enjoyed by this journal in Canada.

The first batch of 1913 Matchless motor cycles are leaving for Canada next month.

### An Automatic Carburettor Experience.

One of the most flattering testimonials we have heard concerning the Binks carburettor is from an acquaintance, who uses one on a 3½ h.p. 1911 standard model. The particular carburettor referred to was tuned in accordance with instructions and converted a machine which had previously been rather sluggish and difficult to control at slow speeds to a state of absolute docility, also it greatly increased the power at fast speeds. Our acquaintance told us he could attain fifty miles an hour on the road, while on Brooklands track he attained sixty miles per hour with a 5 to 1 gear, and with the same gear climbed the test hill. Even if the figures are only approximate, the results are wonderful.

### Catalogues Received.

XI'All, Ltd., 6-7, Moseley Street, Birmingham.—A booklet of "the scientific saddle" is to hand. In it are set forth solid reasons for every point of saddle construction adopted on the XI'All; the reading matter is consequently instructive to all.

Woodgates Bros. (Tiverton) have just issued a list of Patchquick patches and repair outfits, which are so highly appreciated by motor cyclists.

Messrs The United Motor Industries, Ltd., 45, Poland Street, W., have just published a booklet of measurement tables which should be most useful to engineers.

Duocars Ltd. 76, York Street, Westminster, S.W.—The latest list published by this firm contains full particulars of the Duocar, which lately established the six hours' long-distance record at Brooklands, a really fine performance.

There comes a time in the life of tyres when they require retreading. The Hermetic reinforced tread is excellent for this purpose. The tread is manufactured by the Self-sealing Rubber Co., Birmingham, and their work in this direction is of good quality.

Compeer Motor Carriage Co., Colmore Road, Birmingham.—Catalogue of sidecars with bodies of different types.

Stand clip on the Monarch machine.

# "I congratulate

*Zenith Motors, Ltd., of Weybridge, on the intelligent way in which their exhibit is arranged."*

Thus writes "Kuklos," the well-known writer on motor cycling matters in "The Daily News." He proceeds:

"Every auto-cyclist has heard of the Zenith-Gradua infinitely variable gear, and the opportunity of seeing exactly how it is done should not be lost. There is nothing new, of course, in an expanding belt pulley, but everything is new and unique in the Zenith way of doing it, and more particularly in the scientific and ingenious way in which the belt is kept at the right tension, no matter how the belt-pulley on the engine may be varied. There are two standard models—3½, with J.A.P. single cylinder engine 85.5 by 85; and a 6 h.p., J.A.P., V-twin engine, 76 by 85. Tyres on the latter are 2½in. A special Zenith fitting is supplied for use with sidecars. The firm issue an eleven-page book containing nothing but a closely-printed list of Zenith successes in competition during 1912."

*Catalogue and list of 1912 successes sent free on request.*

Patterns.

Suits  
sent on  
approval.

## Is the "Agros" Motor Cycle Suit in your Outfit?

The "Agros" Motor Cycle Suit (as illustrated) is made from our well-known "Agrosette" cloth, and is porous yet waterproof.

No rubber is used in the manufacture of this suit. It is made easy fitting, and the wearer is doubly protected from cold winds, etc., by having a large underlap neatly arranged in front of jacket. This underlap is invisible. The jacket is lined with warm fleece and is of an extra length to give good protection on the saddle.

This Overall is not seatless, but made on the principle of trousers, here again giving extra protection on the saddle.

It is made with inverted pleats at the sides, has strong leather straps to fasten under the boots, and is finished with a belt round the waist.

It is an admirable suit, and much in demand by Motor Cyclists.

All sizes, 75/-

A Cheaper quality Weatherproof, 60/-

SELFRIDGE & CO., LTD., OXFORD STREET, W.

## The Motor Cyclists' Cap

This Cap is exceedingly suitable for the Motor Cyclist, inasmuch as it can be worn either as an ordinary cap, or as shown in the illustration.

It is designed with a specially made elastic round the bottom part, which can be tightened or made loose at will. Another special feature is that it is absolutely waterproof, and about the lightest cap made. Our price 6/6.

## Motor Cycles and Sidecars.

We are now prepared to sell nearly every make of Motor Cycle and Sidecar on EASY TERMS OF DEFERRED PAYMENT.

We invite you to call and inspect our representative stock of Motor Cycles and choose yours. In the majority of makes we charge only 2½% on the balance after deposit has been paid. Payment may be extended over 12 months.

As we are now booking orders for the 1913 season, you will benefit by making early application.

# U.H.

## THE SIX DAYS' OBSERVATION TEST

of the Auto Cycle Union affords the U.H. Magneto another opportunity of proving its reliability and consistency. Mr. J. T. Gibbon, riding a 3½ h.p. Alldays fitted with a U.H. Magneto SUCCESSFULLY CONCLUDED the above test on Nov. 26. Specify a U.H. and relieve yourself of all ignition troubles.

C.D.C.

## A BALL BEARING

is a delicate mechanism, and the finely finished surfaces of the balls and races are quickly ruined by wet and grit which soon work in when the motor cycle is ridden in wet weather.

HUB LUBRICANT is recognised as an ideal lubricant for ball bearings. Its special value, however, is in the protection that it affords against the ingress of wet and mud. HUB LUBRICANT is easily injected and it stays in and keeps wet out.

Hub lubricant is now being generally adopted for bottom bracket two and three speed gear boxes such as Bowden, Clyno, Douglas, Chater Lea, F.N., Bradbury, and James. It is quite different to the usual gear grease.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 14 words or less 1/3, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To insure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

### SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

### SECTION II.

York and Lancashire.

### SECTION III.

## WAUCHOPE'S

9, Shoe Lane, Fleet Street, LONDON, E.C.

'Phone: Holborn 5777.  
Wires: "Opifcer, London."

## IMPORTANT NOTICE.

Owing to the Christmas Holidays, the issue of "The Motor Cycle" for Dec. 26th will be closed for press earlier than usual. All copy and instructions for paragraph advertisements in this Issue must therefore be in our hands not later than first post on Thursday, Dec. 19th.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Hiffe & Sons Limited.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## Next Year's Reliability Trials.

THE proposal to combine the English and Scottish Trials next year has drawn various opinions in our correspondence columns which form interesting reading. Undoubtedly past events have shown that present day motor bicycles are more than equal to a Six Days' Trial over ordinary roads, and the percentage of successes in the Taunton Trials suggested that a trial of longer duration would be an advantage if we are to have a convincing demonstration of the machines which stand out as the best of their type. On the other hand, there are many objections to such a long distance trial, one of which is the obstacle which will be placed in the way of amateur riders who will not only find it almost impossible to spare the necessary time, but may further consider such a test quite unenjoyable, by reason of its strenuous nature. The expense, too, will be considerable. Further, the possibility of such a long distance trial being too much of a physical strain for the average rider must be considered. It is quite true, as a correspondent has mentioned, that last year competitors were only too glad to reach the last day, for even the Six Days' Trial had been rendered particularly severe by reason of the adverse weather, and there is no manner of doubt that if such a trial had been prolonged to twelve days many would have been incapable of surviving it, even if their machines had been equal to the task. It might be argued that the fatigue experienced by a rider is due to the unsuitability of his mount in the matter of springing and comfort, which is true to some extent. It is generally agreed that the annual reliability trials should be made as severe as possible, yet it would be most unfortunate if by reason of the physical strain upon a rider a machine had to be withdrawn. That being so, the first duty of the organisers, should the combined test be approved, is to provide that drivers may be changed. Perhaps it would become too complicated if two drivers were allowed to compete on alternate days, and it would further tax hotel accommodation, so that probably the simplest rule would be to provide that the driver may be changed at the end of the first week.

If, as is suggested, the English trial be conducted from a centre as last year, and the Scottish trial be arranged for the succeeding week on entirely different ground, it would be a comparatively simple matter to

arrange for prospective contestants to enter for the English Six Days' Trials or the Scottish Six Days, or both if they felt sufficient confidence in themselves and their machines to survive such a strenuous ordeal. The fees would, we take it, be similar.

Motor cyclists are inclined to look upon the annual reliability trials as ordinary daily jaunts, and the discussion as to whether a twelve days' trial may prove too much of a strain does not appear at first sight a good advertisement for the pastime, but a study of the mileage chart will show that the distances arranged for each day are much more than the average tourist would plan on a pleasure trip. Let any doubters keep this up for six days, add the mental strain to the rider of the fear that something might happen to his machine (for his reputation depends upon success), and remember that he is, perforce, constantly on the alert owing to the fact that he is riding on strange roads with possible single-figure gradients to encounter at any moment, and their opinion must change. By reason of the dates being separated, makers are able to overhaul their machines completely after the first event, and it is clear that with this attention many a motor cycle of doubtful reliability can survive both ordeals, though if the two events were rolled into one a different tale would no doubt have to be told. There would be less chance of a simply lucky survival in a twelve days' test. When one considers that most of the leading manufacturers support both events, we are inclined to favour the dual event being run conjointly, with the two provisos that (1) entries may be made in either or both events and (2) that drivers may be changed in the case of a manufacturer entering a machine for the combined event.

Whilst on the subject of trials, we think we may reasonably suggest that more care be taken in the matter of selecting test hills. Motor cyclists do not desire machines which will climb sheep tracks, and seldom, if ever, wish to attempt to ride over an exceptionally hilly road strewn with boulders. We suggest that those, whose duty it is to select the hills in these trials, should be guided by the ordnance map, and that no hill should be included unless marked in this map as a first class or secondary road. We have always urged that the severest tests should be included in the annual reliability trials, but we do consider it of paramount importance that the road surfaces should be reasonably passable.

# BROOKLANDS IMPRESSIONS.

## Ten Guineas for Timing a Magneto. Predictions for 1913.

By S. L. BAILEY.

"Neither a great fact, nor a great man, nor a great poem, nor a great picture, nor any other great thing, can be fathomed to the bottom in a moment of time."—*Ruskin*.

IT is with something more than regret that I bid farewell to Brooklands, the awakener of idle dreams, the conqueror of engines, the Waterloo of designers, for it is here I, like many others, have fought numerous battles, not always victorious, but nevertheless always interesting. It is here, too, that I have competed with some of the finest sportsmen it has ever been my good fortune to meet.

But Brooklands is not always serious. The whole atmosphere is full of humour—jokes cracked by knuts, appreciated by knuts; tales of motoring by motorists with a motoristic spirit, and wheezes of every kind by king fakists.

### An Interesting Personality.

Perhaps the most prominent of these was "Sparking Billy," the magneto expert, whose ability to increase the speed of any good engine by five miles an hour was, according to Billy's statement, vouched for by Charlie Collier, G. E. Stanley, and the drivers of the Grand Prix Sunbeams. "Sparking Billy" was in much demand; his success was reported as phenomenal; his fee was the inconsiderate sum of five guineas, but one, evidently of Hebrew origin, gifted with persuasive powers, obtained reduction to the nominal sum of five shillings. But, alas! there came a change. A certain owner-driver, who had obtained a very satisfactory second place at the B.A.R.C. Meeting, and had heard of "Billy's" marvellous deeds, sought his services. On being approached "Billy" was quite prepared to give the necessary extra speed required to win the next event, for a matter of ten guineas. "Billy" always spoke of guineas—it was more professional. The owner was quite satisfied, so "Billy" set to work. Those in the know anxiously watched the finish, with an expression of expectation that surpassed the Fry's chocolate boy. Expectation suddenly changed to disappointment, for the car on which "Billy" had operated was amongst the "also ran." Evidently "Billy" also ran, for he has never put in an appearance from that day to this.

### Brooklands as an Experimenting Ground.

I wonder just how long it would take to conquer Brooklands, to realise one's most idle dream of speed? I should like to spend next season on this famous track, for, like everything else worth experimenting with, it takes time, though doubtless it will come as a surprise to some readers to learn that Stanley, the most successful rider this season at Brooklands, frequents the track less than any other rider I know.

Speaking of riders brings home to me, after an intimate acquaintance, just how little the majority of Brooklanders know of petrol engines. Perhaps I might mention Brewster and Stanley as two of the cleverest; the others are much in the same class, and merely play with carburettors, timing, and compression ratio, or think of some absurd "wheeze" or fake without the least technical knowledge. Probably they obtain speed

by the merest accident, do something sensational, and for a time are in the lime-light. But let them have the misfortune to break up that particular engine, and what do we find? They practically disappear from the successful list. My contention is—that a good rider understands what he is doing, and why he gets speed, so is always in a position to equal his past performances. For proof, where are the riders so much in evidence last season?

I do not wish here to touch upon such subjects as "How to Time" or "How to Get Speed," but hope to do so in a later issue, when I shall deal with points probably unthought of by the majority of riders.

### A Prediction for Next Year.

I predict that the 1913 season at Brooklands will show the distinct merits of the twin engine, with a speed of not less than 80 m.p.h. in the 500 c.c. class, while much better advancement will be shown in Class B with twin engines of 350 c.c., for 70 m.p.h. will not seem fast for the little lightweights.

For engines of 1,000 c.c., I doubt very much if Charlie Collier's record of 92 m.p.h. will be equalled, and I expect very little improvement in the single-cylinders. I fancy I can see smiles at this prediction, but I know at present of one 350 c.c. twin which develops 12 h.p., and whose speed is already known to a select few. This little twin engine will, I think, soon surprise many.

I regret that business compels me to leave Brooklands, the ideal testing ground, the finest track in the world (though admittedly not the fastest)—indeed, the School of Motoring, where none are too learned to be taught.

The writer of the accompanying article, who is leaving for Australia to-day (Thursday), is seen shaking hands with W. W. Douglas. On the right will be recognised W. H. Bashall, the Junior T.T. winner.

OCCASIONAL  
COMMENTSBY  
"IXION"**1913 Carburetters.**

Nothing impressed me more at Olympia than the carburetters. The leading types showed an extraordinary sympathy with our practical needs, and a bewildering wealth of ingenuity. The advance since, say, 1909 is colossal. I must admit that there is an equal advance in metallurgy and in the whimsies by which high engine efficiency is procured; but that is less obvious—you have to take the machine on the road to discover it, whereas a cute observer can estimate the value of a carburetter when a section or a drawing is put in his hand.

**Spring Handle-bars.**

I was particularly pleased to see that a few makers are coquetting with spring handle-bars. I used such a bar on a rigid framed machine nine or ten years ago, and though it was of pretty crude design, I am bound to say that it afforded more comfort, in spite of the rigid fork beneath it, than many a modern spring fork with rigid handle-bar.

Crude devices are apt to be rather "jiggety," owing to the spring action being unduly rapid; but it should not be difficult to combine a refined spring handle-bar with a refined spring fork, designing the two to act in co-operation, after the fashion of the main and supplementary springs of a car chassis. The gain should be equally great in both instances.

Another minor fitting which took my eye was the Air Spring saddle-carrier. Pneumatic springing is generally less bounceable than the metallic type, and this particular patent possesses the great merit of being adjustable. In theory, of course, coiled metal springs can be made of any desired tension, but in practice, so far as machines and forks are concerned, the same springing is generally supplied to heavy men and light.

**The 1913 Trials.**

Critics must remember that the organisers of the chief annual trials are beset with many difficulties, of which hotel accommodation is one of the worst. Few towns can accommodate between one and two hundred additional visitors in the busy summer season, and owing to past hooliganism many hotels and a few towns are not at all eager to receive us. Unless discipline be considerably stiffened next year, it will soon become impossible to find six or ten hotels ready to accommodate the Trials for a night apiece. If we are limited to a single headquarters, with the consequence of routes radiating from a centre, the monotonous repetition of mile after mile of flat road is inevitable. In the public interest it is highly desirable that separate English and Scottish Six Days' Trials should be retained. The amalgamation of the two events into a ten days' trial necessitates the elimination of many trying roads, increases the factor of luck, and reduces the amateur entry.

*Per contra*, the amalgamation would be very welcome to the trade, would diminish the time of absence of the chief riders from the works, reduce expense, and penalise a few machines which complete a six day event in rather a decrepit condition. Nevertheless, until quality improves still further, I prefer the two separate trials. 2,000 miles are better than 1,500, amateur entries are more instructive than trade entries, the chance of bad weather is increased, the advertisement is spread over a larger area, and the additional cost is not really appreciable when it is distributed over such a gigantic output.

In the near future it may be necessary to limit the number of entries; and it is certainly desirable that each firm should stand or fall by a couple of entries—one professional and one amateur. At present it is possible for a firm to enter a fleet of machines, and for the failure of five machines to be over-shadowed by the success of a single survivor. I recall an actual example of this kind which occurred some years ago. A team of machines was entered, and by the fourth day all the machines, with one exception, had retired with various mechanical troubles. The survivor's engine was in rather a shaky condition, and he wired the firm to say that he thought he would do better to retire after the luncheon interval. At lunch he received a wire imploring him to crawl round to the finish somehow, if he had to do it on one wheel and one cylinder.

He persevered, and on the last day happened to snatch a useful advertisement by a feat compounded of luck and skill. This feat was well boomed, and it is safe to say that within a month the superficial public had forgotten the fate of his fellow teamsters, and the one solitary and somewhat fluky achievement was alone remembered. A longer trial would, of course, prevent shaky machines of this type gaining the maximum award.

**A LIGHT FOUR-CYLINDER RUNABOUT.**

The Parnacott, which is propelled by a four-cylinder air-cooled F.N. engine.  
It is very lightly built.

## CONCERNING POWER UNITS.

**N**OW that the Motor Cycle Show is a thing of the past, those of us who are critically-minded are left wondering what are the most striking features that are likely to gain ground in the coming year. Out of a blurred background of dull sameness a few points stand out vividly, and it will be my endeavour to group these points, and where possible to explain the why and wherefore of their existence. To deal with all new features would be tedious, and require more space than I could reasonably expect from Mr. Editor. Therefore this article will be confined to engines, which subject in itself is so large that only a few points can be dealt with, and those briefly.

On the whole there is disappointingly little alteration in 1913 engines, and the reason of this is only too obvious. There is such a large demand for motor cycles at the present time that the manufacturers can sell all they can produce of their standard models without going to the expense of experimenting with new patterns. Who can blame them? For is not the present-day motor cycle a wonderfully reliable and satisfactory machine?

When the demand has been supplied and the slack time comes, we may expect some radical improvements, many of which are now being tried by small firms whom the public refuse to recognise, as their names are at present little known.

These reasons will account for the majority of innovations being found on machines made by small manufacturers, and possibly for the lack of headway which these innovations have made so far.

### Valves.

There is very little change in the matter of valves, though in some cases they have been considerably enlarged,

and the lift decreased so that quieter valve movement may be obtained. This looks like a step forward, and one that might be more largely brought into prominence. The chief criticism which may be brought

against it is that in the case of the exhaust valve there is a somewhat larger surface to be raised against the pressure in the cylinder. This objection has been cleverly got over by Mr. de Lissa, whose new valve shown on a Motosacoche was one of the most interesting novelties in the Show. For the benefit of those who were unable to get to Olympia, or who missed this item, it may be useful to explain that the valve has two seatings, one in the usual place and one directly above in the head. Thus the valve forms a hollow piston, and is held on its seatings by a powerful spring from above, but operated in the usual manner. In this case the pressure in the cylinder has little effect on the valve gear, tending slightly to open the valve instead of closing it. The device has the additional advantage of exposing a large surface of the valve to the atmosphere and thus cooling it considerably (it was for this purpose that the valve was designed). The tension of the valve spring may be controlled from the handlebar, and thus a decompressor action is obtained, since if the spring pressure be weak the valve opens slightly under pressure. One would naturally think that the two seats would be likely to cause compression leaks, but from all accounts this is not so, as the valve automatically beds itself into both seatings.

### Position of Valves.

There is a slightly increasing tendency to place the inlet valve over the exhaust, there being quite a dozen different engines so fitted. The obvious advantages of this design are that the waste heating surface is

7 h.p. Motosacoche enclosed overhead inlet valve gear.

Valve fitted to the Diamond. This is notable for its large diameter and sunk head.

Quadrant overhead inlet valve mechanism.

J.A.P. enclosed rocker gear on overhead inlet valve engine.

reduced, and that the incoming charge cools the exhaust valve head. However, in only one case are the inlet and exhaust valves interchangeable.

Designs which embody both valves in the head do not appear to be gaining much ground, though the Pope and the new Moto-Rève are newcomers in this

**Concerning Power Units.—**

class: The public seems to be afraid of the valves breaking and causing serious damage to the engines. There is a certain amount of reason in this, as up to the present time valve failure and consequently a broken piston have been only too frequent. It must not, however, be imagined that it is impossible to turn out a good touring engine on these lines, for with an increase in valve diameters and better cooling there is no reason why valve breakages should not become almost extinct, added to which in only two cases out of eight in the writer's experience has a broken valve led to further damage.

Deep radiating ribs on the overhead valve Precision.

An air-cooled Precision model and the water-cooled Green-Precision are constructed with both valves overhead, and they will be watched with interest, for Mr. F. E. Baker is not the man to place new models on the market unless he is confident of their success. The design lends itself to the construction of the best possible form of cylinder head, *i.e.*, spherical, or failing this spheroidal, though as yet there have been but few attempts to secure this end. Side by side valves still outnumber by far any other form, probably because they are easily made interchangeable and may be operated by simple mechanism, thus saving some moving parts which usually become noisy after a time. There is also very little fear of damage being done should breakage occur, and finally the public has become accustomed to this type of engine, which has proved itself satisfactory time and again.

**Two-stroke Engines.**

The next type of engine which comes under notice is the two-stroke, in which valves are generally replaced by ports in the cylinder walls which are covered and uncovered at certain times by the action of the piston. The two-stroke movement is gradually growing stronger, and the writer has a firm belief in its future in one form or another. To begin with, it does away with the complication of valves, and con-

sequently with any noise made by them, and with the extra cost of valve timing gear, rockers, etc. Against these advantages must be set a somewhat increased consumption of oil and petrol, a tendency to overheat if the cylinders are of large capacity, and in some cases decreased efficiency per size. All these disadvantages are, however, being rapidly overcome. Thus we find the Levis winning a petrol consumption trial, another machine of the same make taking a sidecar and passenger through a strenuous reliability trial, though it was fitted with a single-cylinder air-cooled engine of only 70 x 70 mm. bore and stroke. Again, we find the Scott, the holder of the Tourist Trophy, is now fitted with an air-cooled head, the water-cooled head being discarded. The Connaught is a newcomer and looks a very nice piece of work, while the water-cooled Stellar is interesting in many ways, being, as it is to all intents and purposes, a two-wheeled car. The Wooler was to be seen last year, but has been somewhat improved, and is very interesting on account of its decidedly unconventional design.

Quickly detachable inlet pipe on 7-9 h.p. twin Premier.

**Outside Flywheels.**

Outside flywheels have made but little progress, and here again public feeling shows itself, for though people appear to put up with the outside flywheel as a feature of two strokes and engines of unusual design, they do not care for it on a standard machine. It is true that, with two exceptions, it is some time since a vertical four-stroke engine has been offered with an outside flywheel, but this is probably because the manufacturer dare not do it. This is curious, especially after the constant successes of Douglas machines, and the smooth running of the Williamson, A.C., and Veloce. With a well-designed outside flywheel a considerable saving of weight may be effected and a solid crankshaft used. At the same time, there are no internal flywheels to throw the oil in the crank case away from the big end bearings, and thus shorten the life of this already much misused part. Much could be written on this subject from both sides but space

Piston, connecting rod, crank-shaft and friction disc of the Girling utility car.

Section of 5-6 h.p. air-cooled engine fitted to A.C. sociables. Observe position of valves.

### Concerning Power Units. —

forbids. I leave the field, however, with an appeal to both manufacturers and public to consider the merits of the outside flywheel before condemning it on its very slight demerits.

### Cylinder Design.

Detachable heads are to be found on a few machines and have the advantages of greatly facilitating the removal of carbon deposit and simplifying valve grinding. These features can also be claimed by certain engines which have detachable valve seatings. Other advantages are also claimed which are too deep to discuss in an article on general design. The Star and Pope are two new machines at Olympia, both fitted with detachable heads.

Against the design may be mentioned the difficulty of making the joint compression tight, but this should not prove serious to any firm capable of building a sound motor cycle engine. Offset cylinders have not become anything like standard practice, though the B.S.A. and little Norton are now so fitted. It is probable that the advantages are not fully realised, or else the advantages obtained are not considered sufficient to warrant the trouble of redesigning present models.

### Lubrication.

Lubrication is possibly the point which is in most pressing need of attention. The present form of splash lubrication works, and that is all that can be said for it. In the hands of an expert, splash with hand pump or drip feed is tolerable, but used as it is by thousands of motor cyclists who give a pumpful every so many miles, or set their drip feeds and leave them, regardless of pace and roads, it is bad and unmechanical, especially as motor cycle bearings (in particular; big ends) are nothing like large enough.

Bearing pressures have been greatly increased during the past few years, and the big ends of many singles and most twins require attention after an absurdly short amount of running. There are obvious difficulties in the way of increasing bearing sizes in the modern light motor cycle engine, so why is not more thought given to increasing their life by the obvious remedy of forced lubrication? There are a few praiseworthy efforts to use the centrifugal action of the revolving parts, and a few more which use a mechanical oil pump to feed some parts of the engine, but they do not go far enough by a very long way. Shame to relate, firms who force oil under mechanical pressure to all their engine bearings can be easily counted on the fingers of one hand, so that it was with joy that I read the description of the new Enfield in the pages of *The Motor Cycle*. I have been fortunate enough to ride a W.D. on more than one occasion, and found that it had a silky feeling peculiar to it, which can only be accounted for by proper lubrication, and its worst enemies could not accuse it of being a dirty engine. In fact, after a strenuous run, I have seldom seen a cleaner crank case. One hears people grumble about the extra complication caused by an oil pump, but this objection is futile, for an oil pump is a simple piece of mechanism and runs under ideal conditions. Let us hope that during the coming year manufacturers will devote some time to this most important item, which will make motor cycles reasonably fool-proof.

### Bearings.

Roller bearings are being fitted to many machines this year; especially are they noticeable in big ends. They score over ball bearings because they give line instead of point contact, and over plain bearings in that they are not liable to seize from under lubrication, and also produce rather less friction. In at least one case they are fitted in the small end bearing, and this seems an excellent place for them, for the small end bearing seldom gets sufficient oil for proper lubrication. The construction, however, must be carefully carried out, or there will be undue weight added to the reciprocating parts. The Pope engine is interesting in that the gudgeon pin is fixed in the connecting rod and oscillates in the piston, a design which has some distinct advantages.

### Cam Gear.

There has been little alteration in the methods of driving cam gear and valve operation, and there are no signs of chain cam gear becoming popular as on cars. The cause of this is that motor cycle timing wheels produce so little noise that alteration is unnecessary. The timing gear on the Diamond is

Diamond power plant, showing bevel gear drive and method of operation.

unusual, being driven by bevels. The whole of this machine is most interesting, and it had the distinction of being fitted with the largest valves for its size in the Show, the port measurement being  $1\frac{3}{4}$  in. ( $44\frac{1}{2}$  mm.), though the bore of the cylinder is only 75 mm.

The timing gear on the twin Brough is also unusual, as instead of one cam being fitted for both inlet and exhaust valve on each cylinder, one cam actuates the inlet valves on both cylinders and one the exhaust; this ensures synchronised valve timing and enables the timing of the inlets to be varied with respect to that of the exhaust.

### Cooling.

Except in a few instances cooling has received but little attention. Water-cooling does not seem to catch on, and curiously enough most twins still have their ribs set at right angles to the cylinder, whatever may be the angle of the cylinder to the vertical. Some Precision models have considerably increased cooling

**Concerning Power Units.—**

surfaces, but on the whole there has been little change in this direction.

**The Low Engine.**

The Low engine attracted a considerable crowd throughout the Show. The cylinder is now partly jacketed with petrol, the head being water-cooled. The heated petrol attains great pressure, and is injected during part of the stroke through a rotary valve. Both inlet and cut-off of this valve are variable. Oil is pumped through the rotary valve and to all important moving parts. The chief feature of the engine is the extraordinary power produced for the size, and its compression of approximately 500 lbs. per square inch. The design is extremely clever and new as applied to motor cycles.

**Decompressors.**

Decompressors are becoming almost standard features, and many and wonderful are the methods employed to reduce the quantity of the charge for starting purposes. Considering the ease of starting on modern motor cycles one is inclined to wonder if it is worth the trouble. Certainly it is a useful refinement, especially on a single-gear mount.

**Moving Parts.**

Pistons, connecting rods, and moving parts remain altered in detail only. It is curious that the solid crankshaft has not a greater vogue, as it removes a fault which is more common than is generally believed. Crankshafts of the present built-up type often get slightly out of line, thus causing excessive wear, vibration, and loss of power. Probably the reasons for not fitting solid cranks are cost of manufacture, and the difficulty of fitting a split big-end to a machine with inside flywheels.

**The Unit System.**

There are a few 1913 machines which have the gears built in the crank case or an extension thereof. This is a practice which the writer particularly admires, as it makes a very neat and compact unit with fewer crevices to catch mud and also saves a certain amount of machining.

The Villiers is a new example of this type, and is very neatly designed. It has a silent chain drive from engine to gears which is a point well worth the attention of manufacturers in general, as the silent chain is somewhat more suitable for running at high speed.

UBIQUE.

## Methods of Finding Winners in Reliability Trials.

THERE are no doubt many motor cyclists, keen riders, who would enter the many club competitions held every year now were it not for the absurd systems of finding first prize winners. Reliability trial riding has reached a fine art, and more depends upon the rider's watch than the machine. as was shown in a recent Midland trial, when a rider of a single-geared Triumph obtained full marks, but was placed fifth in the awards behind four variably geared machines, thus allowing a creditable performance to go practically unnoticed, because he was at a secret check fifteen seconds out of time. In every big competition we find that so many riders obtain maximum marks, and a winner is obtained by a secret check; supposing a trade man wins, he advertises the fact that in such and such a competition his machine made the best performance of the day when he has really done no better than the other competitors who obtained full marks. Anyone who has tried riding through secret checks dead on time will find, when he imagined himself to be absolutely to the second on passing the check, that the results show him to be very much out, to his great surprise.

**Timing by Competitors' Own Watches.**

Some clubs have tried various ways of finding a winner in reliability trials. Flexibility climbs are sometimes adopted, but this is not fair to all riders, because machines differ, and all are not suited to slow conking climbs on hills.

A good idea is timing by competitors' own watches in sealed cases, the time being taken to the minute and second. This rarely results in a tie, and a man knows what time he is arriving at a check, and in the event of his watch gaining or losing there is no difference, because he is timed by *his time*. This practice is used by the Bradford and two Birmingham clubs with success. First prizes in club events, apart from such trials as hill-climbs, speed trials, consumption tests, etc., which clearly give a winner, are un-

necessary, in my opinion. Let the club give a decent medal to all who gain full marks in reliability trials, and it will find a better feeling existing among the competitors and bigger entries for its competitions. Give special medals for amateurs, and let the amateur see that he is being fostered. I am speaking now of the *bonâ fide*. Should any competitor shine conspicuously over the others and be the only one to gain full marks, make him by all means the winner. In this case he would certainly be entitled to receive the honour, but secret checks are an abomination. Suppose the A.C.U. adopted them in the one day trials, etc. What would the trade say? And it is clearly shown in A.C.U. trial that one machine can perform equally as well as its rival, hence the satisfaction obtained by the trade from these events.

**The Way to Award Trophies and Cups.**

If clubs are fortunate enough to become possessed of a few trophies and cups let them set store by them and keep them in the club members' hands till the end of the season, then classify the results of all competitions under such headings as reliability trials, hill-climbs, and speed contests, and smaller events such as speed-judging and petrol consumption tests, and award a cup for the best performance in each class of competition; if the club has plenty of prize money or spare awards it can give firsts, seconds, and thirds for each class. This method would meet with the approval of thousands of clubmen who are keen on trials but cannot compete in speed events and hill-climbs. A man may get three firsts in a club hill-climb with a machine that would not last twenty miles in a reliability trial, hence the need for classification in awarding trophies. The sooner something is done to equalise performances in trials, and award prizes on fair lines, the better it will be for all concerned. The trade man should be a little less keen on walking over the amateur, because it is the amateur who keeps the trade alive.

S.A.R.

# Flexibility Hill-climb at the Cape.

(1) Competitors lining up along the tramway line.

**T**HIS competition was held on Saturday, November 16th, on the Kloof Road, the active Cape Peninsula M.C.C. organising the event.

The distance was about half a mile, from Camps Bay to the "Round House," and the eighteen competitors were each given one slow and one fast attempt, the greatest difference determining the winner. There was a class for variable and another for fixed gears, the latter only attracting a couple of entries.

The results on formula of the variable-gear class are:

1. J. Nosworthy (4 h.p. Singer and sidecar).

2. W. F. Duell (3½ h.p. P. and M.)

The winner on his Singer and empty sidecar had in his slow attempt all the advantages of a smooth-acting clutch, his time, 13m. 12½s., beating that of the next man, J. Thornton (3½ h.p.

(2) The Rendez-vous at Kloof road.

Bradbury), by nearly five minutes. The latter, however, made best time in his fast attempt (1m. 49½s.), Nosworthy being considerably slower.

Only one other sidecarist, J. Hopper (3½ h.p. New Hudson), competed.

Several contestants failed to keep the engine going in the slow attempt, the average gradient of the hill being 1 in 7.

(3) Scott (Rudge), in the fast attempt, nearing the bend.

(4) J. Nosworthy (4 h.p. Singer and sidecar), winner of the flexibility climb, (variable gear class).

## ANOTHER CHRISTMAS TRIAL.

Already twenty-four entries have been received for the South Birmingham Motor Cycle Club's reliability trial, which will be run off on Friday, the 27th inst., starting at 9 a.m. from the Gun Barrels Hotel, Bristol Road. The route will be *via* Rose Hill, Worcester, Gloucester, Birdlip, Cheltenham, Evesham, and Alcester.

## SUBSTITUTE FOR PETROL.

*The Sporting Star*, Johannesburg, of September 21st, describes a test with a new motor fuel known as "Parol." A 3½ h.p. Rudge and sidecar was used for the test, and a claim is made of 50% greater efficiency. Both petrol and "Parol" were used, no adjustment to engine or carburetter being necessary with the change of fuel. "High Tension," a contributor to the above-named paper, writes as follows regarding the test: "(1) 'Parol' ignites and performs

the same as petrol. (2) No adjustment or alteration to engine, carburetter, or mechanism is necessary. (3) Can be used in any engine or carburetter. (4) Evaporates less freely when exposed to the air. (5) I have yet to investigate the claim regarding increased efficiency, and have also to see what effect, if any, its use has on cylinders or other parts." Representatives of the principal motor firms in Johannesburg witnessed the test above described.

## SIDECARS AND CYCLE CARS.

**T**HE development of new vehicles is always watched with much interest by everyone interested in motoring, and a year or two will be needed to show whether the cycle car will become a popular vehicle or whether it will eventually be regarded as an unpractical fad like the heavy tricar.

Those of us who can look back over a good many years can remember a host of weird vehicles which have made their appearance since the old high bicycle was first put on the road, and which one never sees now except on the scrap-heap of some small dealer.

Tricycles with large and small wheels arranged in different ways, quadricycles, and the old heavy type of tricar are occasionally seen on the road. Is the future of the cyclecar to be with these, or will it rather replace the popular sidecar?

### Development of Cars and Motor Cycles.

There seems to me to be a considerable difference in the way the development of cars and the development of motor cycles has been engineered in this country. The car makers, for years at any rate, simply followed Continental practice at a distance, while they strove to impress on their customers that their productions were as good as, if not better than, their rivals.

On the other hand, the bicycle maker has undoubtedly done his best to work independently of any foreign example and to give due attention to his customers' needs and wishes. Witness, perhaps better than anything else, the enormous development of variable gears in the last two years.

If it be possible to indicate a fault it is perhaps this, that manufacturers have devoted too much attention to the sporting side and not enough to the touring, so that the improvement of spring frames and other aids to comfort in riding have not kept pace with driving efficiency. Be this as it may, the British motor cycle industry is easily the first of its sort in the world, and can hardly be said to be in any danger of foreign competition. Its goods are deservedly booming.

### Crude but a Practical Success.

The motor bicycle and sidecar combination may perhaps be compared in a way with the old Daimler and Panhard type of car gearing now in common use, of which the celebrated engineer who introduced it said, "It is crude and brutal, but it goes!"

The sidecar attachment is undoubtedly crude as a passenger conveyance; it imposes strains that are brutal, in the French sense, on the frame of the bicycle, and it is wasteful of horse-power, yet it undoubtedly provides a useful and sociable means of carrying a passenger, and is deservedly popular.

The passenger's comfort is well secured, but the driver's place on bad roads, or in bad weather, is much

less enviable even than if he were riding the bicycle solo, and is not to be compared for an instant with the comfort he can obtain in the body of the crudest cycle car. It is in the attempt to remedy these drawbacks that the cycle car has been introduced. Had more attention been given to the development of the springing of the bicycle frame, it is possible that the interest in runabouts would not be so great as it certainly is.

### Increased Comfort.

There is no doubt in the writer's mind that the new movement will be a success, the only question being the measure of that success. The man who has been content up to now with a sidecar combination will welcome the neater appearance, increased comfort, and greater efficiency of a runabout, provided always, as the lawyers say, that it is within his means and will give him satisfactory and lasting service.

It should be remembered by manufacturers that great care must be taken with the workmanship and material of these light four-wheelers, or they will soon shake themselves to pieces on bad roads at the high speeds they are intended to run, and, further, that the price must be kept low.

The bicycle part of the present popular combination, which takes the chief strains, can easily be built strong and rigid, and the present standard of strength and rigidity must be adhered to at least. It is to be feared that some of the experimental machines now being marketed will fail in this respect.

It should not be forgotten, too, that directly the cycle car exceeds a certain weight and cost it has serious rivals. There are several small, light cars on the market with water-cooled engines and costing from £130 to £175, as well as two or three well-known American makes with four-cylinder engines of about 20 h.p., and these cars are wonderfully reliable and light considering their power.

### Weight, Speed, and Horse-power.

It is tolerably safe to predict of the successful cycle car that it must be small, otherwise it cannot be strong enough without being too heavy; it must be as cheap as possible, or the public will prefer to go direct from a sidecar combination to a full-blown motor car when increased comfort is sought; it must be as simple and easily understood as the motor bicycle. People are beginning to understand that cost of upkeep, both as regards tyres and petrol, is a question of weight, speed, and horse-power, and so, above all things, weight must be kept down, and too high speeds should not be aimed at if economy be studied. Five or six hundredweights should be quite sufficient for the complete vehicle.

POTTERER.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the "Editor, The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

#### The Unborn Runabout.

Sir,—I have read with much interest "Cycle Carist's" letter in your issue of November 28th, and should feel extremely obliged if he would give me particulars of the cycle car which cost him £31 to make. I should like very much to make one for myself this winter, so that my wife and I could enjoy a run in the summer months of next year when it comes along. I certainly cannot afford to buy a cycle car at the present price. I have a motor cycle, but it only carries one, and I should like to share the joys of the open road with my partner.

FLY WHEEL.

#### Motor Cycles in Chamonix.

Sir,—With reference to "Twin's" interesting article concerning his tour in Switzerland and France, he was misinformed as to his being the first English motor cycle to reach Chamonix, as in August three of us, riding English 3½ h.p. machines, went there from Geneva. We were also told that the road from Chamonix was almost impossible, but as we wished to reach the Rhone Valley, to save time, we risked it, and went over the Tête Noire and Forclaz passes. The latter proved to be one of the most severe tests for a motor cycle that it would be possible to imagine, the hairpin bends being extremely steep and acute. We, however, reached the top in good style with only one stop to cool down. We would warn your touring readers not to attempt this route in the reverse direction (from Martigny to Chamonix), as the road from Martigny to the top of the pass is in very poor condition in some parts, hardly affording a grip for the wheels. We cannot speak too highly of the joys of motor cycling amongst the Alps.

TRIPLETS.

#### Sidecar Spindles.

Sir,—For the benefit of motor cyclists in general, I would like to give my experience of the other day while taking my boy, age 4½ years, out for a ride. While travelling about 20 m.p.h. on a splendid bit of level road, the sidecar spindle snapped off, and you can guess the result. A high turf hedge hit us in a flash of time, and perhaps you may not believe it, we were both up again in ten seconds absolutely without a scratch or bruise of any kind. On "picking up the bits" I found a very severe flaw in the spindle. It was only ½ in. diameter, which, personally, I do not think is enough even if sound. About twelve months ago I put a query to you re the strength of sidecar axles, to which you kindly replied that I need not worry at all about it. Of course I do not impute any blame to you, but I thought that perhaps you would be interested in this little adventure. I might say I have carried my wife and boy hundreds of miles on all sorts of roads without any kind of mishap, and other "heavy" friends at different times. The sidecar cost £6 10s., and was got from a well-known and reliable firm of dealers. I think there should be a greater margin of safety on all vital parts such as these, so as to allow a little for any possible flaw (which, of course, it is usually impossible to detect from the outside) that might be there. I think the majority of your readers will agree that the attention of the makers of these articles should be drawn to this matter.

AF 274.

[We have enquired of two leading makers of sidecars for the measurements of their standard sidecar spindles, and give them below:

	Max. diam.	Min. diam.
W. Montgomery and Co.	1½ in.	¾ in.
Mills-Fulford	¾ in.	1½ in.

The above dimensions ensure a margin of safety.—ED.]

#### Silencers.

Sir,—With reference to Mr. H. C. Wyley's letter concerning silencers in your issue of the 5th, I have been expecting to see some such letter as this, and, like him, fail to see how the new regulations can affect the cut-out as fitted to present day silencers. In this connection also I fail to see why the Triumph Company are altering theirs and fitting a long exhaust pipe, unless it be that they intend going further than the regulations require. On page 1159 of same issue you publish the text of this new regulation, which reads that no cut-out shall be used which shall allow exhaust gases to pass out *before* having passed through a silencer.

Hence, I cannot understand the alarm of some motor cyclists who talk of taking off the cut-out fitting or of having a long exhaust pipe fitted, etc., etc. Your opinion, Mr. Editor, will be valuable to all your readers on this point. It is my intention still to use, with discretion of course, my cut-out, as it would very materially affect the running of my machine if it were permanently shut. C.M.

Sir,—May I crave a little of your valuable space in which to reply to some of the points raised by Mr. L. J. Austin in his criticism of my article on "Compulsory Silence," which I will endeavour to do as shortly as possible.

1. I hold no brief for the man who makes a nuisance of himself, and if Mr. Austin will kindly read through my article again, with a little more care, he will see that I advocate drastic punishment for those inconsiderate riders who, besides causing great and unnecessary annoyance to other people, bring the whole pastime into disrepute.

2. I do not hold the view that noise and efficiency necessarily go together, nor do I insult our highly qualified designers, who have given us in the motor cycle of to-day what is probably one of the finest examples of modern engineering extant, by telling them that they are incapable of designing a really efficient silencer. But, on the other hand, I must remind Mr. Austin, since he appears to have forgotten it, that efficient silencers have been by no means general in the past, and are not entirely so on 1913 machines. My own machine last season was fitted with one of the finest engines of the day, but if I shut the cut-out the speed visibly dropped, and if it was kept closed for long the engine began to overheat. Now, does Mr. Austin seriously suppose that the enormous number of motor cyclists who ride old machines with inefficient silencers (there are quite a lot of us who cannot run to a new machine every year) are not going to try to get more power with the cut-out closed, whether at the sacrifice of silence or not? And the same applies to the owners of those 1913 models whose silencing arrangements are still inadequate, and there are many such.

3. I disagree with Mr. Austin that the silence of the modern car has not increased its danger, and I think he will find, if he cares to investigate the matter, that a good many accidents may be traced to it. His argument that, granted that the silence of the automobile is dangerous, we ought to keep our cut-outs open in crowded places, is futile, for no motor cycle at present made glides along with the absolute silence of a car, even with the cut-out shut.

Finally, will Mr. Austin please tell me why the makers of the Indian motor cycle, who are strong advocates of silence, after abolishing the cut-out on their 1912 machines, have replaced it for 1913?

**Military Motor Cyclists.**

Sir,—As no doubt you remember, some time during last July, the War Office asked for a number of motor cyclists to volunteer for duty with the Army during the Manœuvres. I believe they got the required number, and during and also after the Manœuvres we heard a great deal about how well they performed their work, and what a help they were, but now, apparently, the War Office have forgotten all about them, as no pay or acknowledgment has come along up to date. Now, sir, do you think this is the way to get us another year? I have asked several for their opinion, and they all say "No thanks."

DISGUSTED.

**A Substitute for Petrol.**

Sir,—The ever-increasing price of petrol, which has already reached an exorbitant figure, must result sooner or later either in the adoption of a much cheaper substitute, such as paraffin, or in the serious crippling of a vigorous industry.

Paraffin costs 6d. per gallon, and when one considers the large number of high-class and efficient engines in the marine motor world which run either on petrol or paraffin at will, and which include both two-stroke and four-stroke types, one naturally wonders why a similar choice of fuel is not open to the purchaser of a cycle or a car.

There could be no simpler or more economic engine for car, carrette, or cycle than the two-stroke paraffin motor. The two-stroke engine has already proved itself second to none on the road, and the slight loss of efficiency through the use of paraffin could be borne with equanimity, if the fuel used were obtainable at a reasonable price.

RYNO.

Sir,—Seeing notes at times in your paper about the use of paraffin for motor cycles, I would like to give an experience. On the evening of the 5th inst., at 6.30, I started a 4½ h.p. Calthorpe machine on a carburetter full of petrol, the tank being full of paraffin. After running from Birmingham to Stafford in 1½ hours with sidecar, I obtained another half gallon of paraffin to be sure of having enough to carry me further. I proceeded with my run and reached Manchester by exactly 10.30 p.m. without further use of petrol, the consumption being 1 gal. 1 qt., and the carburetter an Amac. On examination next morning I found the plug quite clean. All the difference I noticed was that the spark needed more variation than with petrol.

FRANK PRICE.

**Shape of Combustion Chamber.**

Sir,—With reference to "Magneto's" ideas upon combustion chambers, he appears to think that because the spherical type gives the greatest petrol economy, it will overheat more than the "pocket type" on hills. From the very fact that, for the same dimensions of engine, the spherical type gives more horse-power for the same strength and quantity of mixture than the pocket type, it is evident that it will prove superior to the latter wherever more horse-power is needed either on hills or for speed.

The cooling explanation is fallacious, as the spherical type will not require so much throttle opening as the pocket type when climbing the same hill, and consequently even if the reduced cooling surface had anything to do with the question, less heat is lost in heating up the cylinder walls than in the pocket type, since the former is more powerful than the latter, for the same cylinder capacity.

"Magneto" is wrong in supposing that as the mixture becomes richer the cylinder temperature becomes higher, as it is well known that the mixture for complete combustion (neither rich nor weak) develops the maximum cylinder temperature; in fact, as the mixture gets weaker or richer than this, the cylinder temperature falls nearly in direct proportion.

Some recent experiments upon exhaust temperatures with different mixture strengths by the present writer confirm the existing beliefs upon this subject.

Further, it is the accepted idea of the leading authorities, such as Messrs. Lanchester, Clerk, Dr. Watson, etc., that the spherical head is the most efficient—that is, gives more horse-power for the same petrol consumption than any other type—apart from such advantages as more rapid ignition velocities and greater charge induction, etc.

"Magneto's" numerical data are interesting, and perhaps it may help matters to mention that completely to combust 1 lb. of petrol requires not 3½ lbs. of air, but 14.75 lbs., according to the ordinary simple chemical calculation and from various authorities (vide Dr. Watson's "Thermal

Efficiency of a Four-cycle Engine," Proc. Inst. Autom. Engrs., 1908], and that the most thermally (not mechanically, as he assumes) efficient mixture is about 17 lbs. of air to 1 lb. of petrol—that is, about one-sixth more air (not double) than for complete combustion—so that his arguments based upon his figures are quite wrong.

D. M. NEWTON.

Sir,—In reply to Mr. Cutbush's criticism of my article I should like to point out to him the following facts: First, the quantity of heat absorbed by a body is no indication of its temperature, other factors having an important bearing on that matter. To take some figures which seem to appeal to Mr. Cutbush, one ton of water will absorb 56,448 gm. calories with a rise in temperature of 1°C., but the same amount of heat will raise 1 lb. of iron through 1,133°C., provided, of course, that no losses occur in the transference.

Again, I do not at all agree with him when he says that the coolest cylinder is the one that presents the least surface to the charge and the greatest to the air. Were this so water cooling would be unheard of, as efficient air cooling could be obtained by simply making a cylinder with sufficiently large radiating mns. and I think most designers of air-cooled engines will agree with me in saying that large surface is not the only factor in satisfactory cooling. Had Mr. Cutbush substituted "effective radiating surface" for "surface exposed to the air" I might have been inclined to agree with him, but that is a different matter.

With regard to Mr. Cutbush's figures I should like to know why he confines his investigations, out of the whole cycle of operations, to the moment of firing, and what law of physics does he use to prove his statement? He takes the temperature of the gases to be 1,500°, but omits to mention whether this temperature is measured from the zero of the scale or from absolute zero. No mention is made of the temperature of the cylinder walls, and assuming, as I suppose he does, that both cylinders start at the same temperature, he tacitly assumes that the spherical combustion chamber will be the cooler when a steady state has been reached. W. McWHINNEY, A.R.C.Sc.I. ("Magneto.")

Miss Marshall, of Clay Cross, a member of the North Derbyshire M.C.C. Her mount, which is fitted with a 2½ h.p. Minerva engine, was built throughout by her father, who is over seventy years of age and has never had an hour's tuition in motor mechanics.

### Engine Bearings.

Sir,—I notice in a recent issue of *The Motor Cycle* a letter from a reader asking for experiences regarding the wear of engine bearings, and think the following particulars may be of interest.

I use a 4 h.p. J.A.P. engine, which has run some 12,000 miles, being used mostly with a sidecar, and geared about  $5\frac{1}{2}$  to 1. The pulley side crankshaft bearing was renewed after 4,000 miles owing to wear caused by an experimental pulley with a large amount of overhang. The big end bush ran for 11,000 miles before being replaced, and the gear side crankshaft bush is still in use after 12,000 miles, as are also the original timing gear bushes!

Owing to a scored cylinder necessitating regrinding and a new piston, the original gudgeon pin bush was replaced after 7,000 miles, being then practically unworn. This bush is hardened steel in the J.A.P. engine.

In connection with the present discussion of the relative merits of air and water-cooled engines, the possibilities of fan cooling seem to have been overlooked. About six months ago I had a three-speed gear fitted to my machine, and at the same time arranged a 7in. fan (driven by belt off the pulley boss and a small bevel gear) in front of the engine, and find that I can drive with sidecar up long hills calling for the bottom gear of  $10\frac{1}{2}$  to 1 without the least sign of overheating, and never have to stop to cool, even after the hardest driving.

ZERO.

### The Experiences of a Beginner.

Sir,—In perusing your paper for the last twelve months I have noticed many questions which have been asked by the unsophisticated or prospective motor cyclist. Summarised, these questions include the following:

1. Cost of motor cycling.
2. Reliability, hill-climbing power, and speed.
3. Pros and cons of chain and belt drive.
4. Horse-power for passenger work, and the question of gears.

My experiences as a beginner may help some others, especially when I state that I motor for pleasure only, and have not the slightest interest in any manufacturing firm. All my riding has been with a sidecar and passenger, including, many times, a fair amount of luggage.

Under the first heading, for a season's mileage of 3,000 miles the cost has been three halfpence per mile. This figure includes depreciation, running expenses, licences—in fact, all my expenses due to motor. My first machine was a powerful single gear belt-driven clutch model. This ran perfectly, with the exception of a slipping belt, which happened approximately every hundred miles, then, as you know, it had to be shortened. A trip in the Peak country at Eastertide settled the question of single gear and belt drive as far as I am concerned. One evening it took three hours to do twelve miles. Further comment is needless. I decided either to go back to Shanks's pony, or buy something that would climb single figure gradients. Result, I bought a James, two-speed, chain drive.

As motorists, we all appreciate the remarkable performances of professionals in reliability and speed trials, but are they of much value to the amateur, and especially the beginner? What we wish to know is, what the ordinary touring machine will do rather than what a machine tuned up every time it leaves the works will accomplish. On my chain-driven machine I have had three stoppages, number one due to a drop of water in the carburetter, therefore no fault of machine; number two, through chain wheel nut on engine-shaft coming loose, which was rectified in a few minutes; number three, chain wheel on counter-shaft came loose; this had to be sent to the makers, and the firm put a newly-designed counter-shaft in, and on this it is impossible for the wheel to come loose, as four raised keys have been embodied in the shaft. No charge was made for it. As to hill-climbing, I have yet to come across a hill which bids me shed my passenger, and I have been in Cumberland, North Wales, and the Peak District. On open roads I can easily average 30 m.p.h., and, if necessary, can do over 40, by speedometer. My petrol consumption is approximately 80 m.p.g., Amac jet used being 29.

Regarding the chain drive, I may say that the chains run beautifully, and have only had to be adjusted once. I am unable to find that harshness in them about which so many devotees of the belt drive talk. Maybe the bath of grease and graphite has something to do with this; anyway, a slipping drive is a thing of the past.

B.A.

The horse-power is nominally four, and I have found it ample. It has been stated in your columns that with low horse-power a machine is soon knocked to pieces, but a thorough overhaul of mine shows that it is as good as when I took delivery last June. The counter-shaft gear is perfectly satisfactory, but not having had experience of an epicyclic hub or engine-shaft gear I cannot make comparisons.

A. ENGLAND, M.Sc.

### The Wear of Small Engines.

Sir,—My motor cycling mileage up to date is composed as follows: 1908 (six months),  $1\frac{3}{4}$  h.p. F.N., 1,253 miles; 1909,  $3\frac{1}{2}$  h.p. Triumph, 4,008; 1910, Triumph-Gradua, 3,365; 1911 (eight months),  $2\frac{3}{4}$  h.p. Douglas, 2,350; 1912,  $2\frac{3}{4}$  h.p. Douglas, 3,700; total, 14,656 miles.

Having done 7,373 of the above with "large" engines, and the remainder, 7,283, with small ones (6,000 of which were with twin cylinders, which might reasonably be expected to give more trouble than singles), I feel that I can express an opinion founded on experience. To have ridden one of the best known medium-powered machines and one of the best known lightweights an approximately equal distance is about as good a test as can possibly be made, bearing in mind that each traversed practically the same roads, under similar conditions, surface and gradient, and were driven by the same rider, with an equal amount of care in each case.

Of course, did one not get a new machine every year, it is possible that some difference would be apparent in a very prolonged mileage, but for a lightweight to cover 3,700 miles with no mechanical trouble to speak of, and to be run often at 30 to 40 m.p.h. into the bargain, is, I think, a sufficient indication of its quality. The engine of my present machine has only had carbon deposit removed and valves ground once, and that after 2,000 miles had been traversed, and the same applied to last year's make. The following extracts from my diary are all the mechanical "troubles" experienced with my last two lightweights:

#### DOUGLAS, MODEL E (1911).

##### Mileage.

- 1,235. Valves stuck with oil, causing misfiring at start. (Needed cleaning.)
- 1,975. Front cylinder bell crank (for tappet) stuck. (Had never been oiled; own fault.)
- 2,150. Front plug sooted.
- (2,290. Carbon removed, etc., for the first time.)
- 2,302. Front plug sooted.

These are absolutely all the "troubles" connected with the engine in 2,530 miles total running, and not one of them is really worth mentioning.

#### DOUGLAS, MODEL K (1912).

##### Mileage.

- 475. Exhaust valve stems stuck with congealed oil (when cold). (Rubbed with emery cloth.)
- 685. Ditto. (Put into lathe.)
- 1,165. Ditto. (Only disadvantage, irregular running until warming up of the engine liquefied the oil on the stem.)
- 1,366. Ditto. (Apparently lubricating rather generously.)
- 2,110. Ditto.
- (2,185. Carbon removed and valves ground for the first time. Really unnecessary yet, but taking the machine away when on holidays.)
- 2,715. E.V. stems stuck again (when engine cold).
- 3,160. Cam wheel pin of timing gear loose, upsetting timing, especially when the engine was run at all fast.

These are absolutely all in 3,700 miles to date. There is really only one worth mention, and that is the last (sticky valves at the start being a fairly common experience). The pin was easily tightened up again, but I wrote and worried the makers about it, asking them how I could prevent its recurrence, and they very generously offered to give me a complete new crank case free of charge, and sent me a "locking frame" for the timing gear, which I fitted. But I cannot send the engine to them at present as I am still using it, with every satisfaction, I may say, having done 540 miles since then. I have never broken a valve, and on this year's machine have not even had a sooted plug, and this in 3,700 miles!

In conclusion, I would say that, from my experience, at any rate, the engines of the Triumph and the Douglas appear to give about-equal satisfaction.

OILE.

*Bringing in the Boar's Head.*

## A Prehistoric Banquet.

Our prehistoric forefathers were a sporting lot ; they hunted the woolly elephant and the Iguanasauros with arrows and stone clubs—they had no “Cordon bleu” chef to cook him when caught, but probably enjoyed the eating just as well as we do.

The modern man has greater luxuries—good wine, good food, good cooking, and a comfortable motor cycle to take him to the feast.

But best of all, he has the AVON TYRE wherewith to cover the wheels of his motor cycle and make his journeyings as comfortable as “riding on air,” and a good deal safer.

AVON TYRES are strong, resilient, and durable, and can be retreaded after thousands of miles. Compare the “tyre” of the past with the AVON and give thanks to the makers.

*A Seasonable  
Suggestion :*

If in doubt about **the** Xmas present for your motoring friend send an AVON and give him an agreeable surprise.

**No Advance in Price.**

**Have YOU tried AVON or NOVA GOLF BALLS. Avon 2/-; Nova, 1/3. Standard, Heavy and Junior.**

*In answering this advertisement it is desirable to mention “The Motor Cycle.”*

# MOTOR CYCLES FOR 1913.

DUNHILL'S are Agents for the REGAL GREEN PRECISION MOTOR CYCLE.

You are strongly advised to place your order for the 1913 Models at once.

DUNHILL'S have excellent facilities for the supply of 1913 Motor Cycles of practically every known make. Customers can place their orders now without fear of being disappointed.

Reg. No.  
599507.

## "THE FAMILY BASKET"

with extra Side Seat.

Cane Body . . . £6 - 10 - 6

Sidecar Combinations from  
£5 - 12 - 6.

B 13.

## 1913 MODEL SIDECAR.

Special Cane Torpedo Body, with side entrance and cupboard.

Body only . . . Price £9 - 8 - 6.

For Chassis, see our Motor Cycle Catalogue—price from £4 - 8 - 6.

OUR NEW MOTOR CYCLE CATALOGUE IS NOW OBTAINABLE, POST FREE.

GLASGOW: 72, St. Vincent Street.

**Judging Distances with One Eye.**

Sir,—In the last issue Dr. Selby Clare enquires if, in the case of a person who has sustained the loss of an eye, would it render such person incapable of safely riding a motor bicycle?

It will interest Dr. Clare to learn that an intimate friend of mine lost one of his eyes some years ago through an accident, but has not in any way been incapacitated from riding or taking part in competitions, and more than once winning such.

Also one year he rode in the Irish End-to-end Trial, and gained a medal. At present his mount is a 6 h.p. Enfield and side car. He wears glasses even when riding to prevent undue strain on his one optic.

R.G.L.

**A Novel Machine Promised.**

Sir,—With reference to "Ixion's" comment on springing in the last issue, I have an engineering friend who is devoting considerable time and attention to the perfecting of a comfortable and economical motor cycle using petrol or a percentage of petrol and paraffin or paraffin alone on full load without a vaporiser.

A machine will be placed on the market in about six months that possesses more comfort than the present best car to ride on. This machine, I understand, will carry one, two, or three passengers without any noticeable difference to the springiness of riding. The wheels are made of aluminium, which will certainly be very convenient to clean and cannot rust. The special feature that takes my eye is the exceeding lowness of the design, which will enable quite a small person to control the balance with ease. It has front wheel drive, back wheel steering, wheel control, and portable seats. In wet weather the whole machine can be covered in by a light waterproof. I understand provision is made to always carry the extra seats and waterproof, and these give to the machine an appearance of a motor car when in use. The appearance of the machine generally is delightful. It does not possess the heavy and clumsy appearance of the present type, and I feel certain my friend's only trouble will be to cope with the enormous demand.

If this should catch my friend's eye, I hope he will not be annoyed at me giving vent to my delighted feelings, as I have not exposed any details that I have been entrusted with.

P. MATHEWS.

**Decompressors.**

Sir,—Our attention has been drawn to an article by Mr. B. H. Davies in the issue of the 5th inst. in which appears the following: "The decompressor has come too late. It is an admirable fitment on a T.T. single gear, or to ease the shove of a kick starter; but a solo rider with a variable gear will not value it excessively, for the engine is so easy to start without it. Four years ago I would gladly have paid £5 for a good decompressor; this year I had one on my three-speeder, and I never used it except for a wheel-pull engine start. Decompressors will be convenient, but scarcely as necessary as once they were."

This may be Mr. Davies's view, but is it not in direct opposition to facts? Curiously enough in the days of the single-speeder, decompressors were non-existent (almost), and it was not until the kick-starter and variable gear became really popular that manufacturers adopted the decompressor.

To those who fully understand what a decompressor will do, it has always remained a mystery that it remained so long neglected. Had manufacturers adopted it seven years ago, it would undoubtedly have exerted enormous influence on the design of motor cycles and the demand for them, doing away, to a great extent, with the demand for expensive clutches and variable gears, and removing, for good and all, nearly every objection that can be made to the push start.

Despite Mr. Davies, we hold the opinion that decompressors are as necessary as ever they were, and they are something more than a convenience. Riders of machines with variable gears will understand how much better it is to run in crowded traffic on low gear with the decompressor in use and preventing the engine tearing its heart out and getting pink hot. As for sidecarists, there must be many who still think that the advantage of a decompressor would not be too dear at £5, though they might not be prepared to pay that amount—and are not asked to do so. We look to the 1913 season to disprove Mr. Davies's statement and modify his views.

THE ENDRICK ENG. CO.

**Fifty-eight Competitions in 1913.**

Sir,—With regard to the 1913 competitions, in my opinion the clubs are quite capable of running all the one day reliability trials needed—in fact more.

Why should the A.C.U. compete with the clubs by running quarterly or half-yearly one day trials? The manufacturers want fewer trials at less expense, not more. The Six Days' Trials waste nearly a fortnight's time.

Why not make them five days? It should still be possible to cover 1,000 miles, and the men would be able to leave home on a Saturday and return the following Saturday.

What an absurd proposition it is to run the A.C.U. and Scottish six days' trials consecutively!

The competitors would be absent from home nearly three weeks, and, as far as manufacturers are concerned, there would be only one advertisement from them instead of two, and only one opportunity of a strenuous test instead of two.

If a machine fail in the A.C.U. Six Days' there would be no time to revise details and try again in the Scottish or vice versa.

A rough analysis of the diary of events for 1913, published on page 1444 of your issue of December 5th, shows fifty-eight in all. Of these nineteen are open trials, including two A.C.U. one day trials and one six or more days. Twenty club trials, including three East Midland Centre A.C.U. events, seventeen hill-climbs, six Brooklands meetings, and the T.T. races. These are without a mention of any Scotch or Irish events.

I would suggest that two 1,000 miles Five Days' Trials be run by the A.C.U. and Edinburgh M.C.C., one as early as possibly the other in August.

MANUFACTURER.

**The Proposal to Combine the Scottish and English Six Days' Trials.**

Sir,—Mr. Talfourd Wood has suggested that the views of manufacturers might be of interest in regard to a ten days' trial. Personally, I am wholly in favour of such a trial—firstly, because I find that on a well-sprung cycle car there is no discomfort after a long ride (my lady passenger in the Six Days' Trial agrees with me), and, secondly, because if the Scottish and English trials are held separately many manufacturers (including myself) will certainly enter for both, and the time and expense will be greater than if they are held together. On the other hand, I know that some riders do feel the strain of even a six days' trial, and the ten days' will probably eliminate the genuine amateur altogether. These trials have had a twofold object—to test the skill and endurance of the riders and to test the reliability of the mechanism. Undoubtedly the latter is becoming the main feature of the trials. Now, ten days may be an unfair test for a rider, but it is certainly not an unfair test for the machine. On the contrary, I cannot imagine a more useful test, not merely as an advertisement, but as an object lesson for the manufacturers.

Would it be possible to allow a rider to compete for half-time, and to win the reward of his riding in the shape of a medal or certificate, and then to allow a second rider to complete the trial on the same machine? This course is already adopted in long-distance trials at Brooklands, such as that of the Duo. This is only a suggestion, which might serve to meet the difficulty of the human element. Personally, I should hope to drive through the ten days, as I do not feel the difficulty.

May I suggest that "an absence for the best part of three weeks" is rather a liberal allowance for a ten days' trial? A car should be ready to start the day after it arrives on the course and to return the day after the trial. If not, it is the fault of the car or of the driver.

H. F. S. MORGAN

**NOTICE.**

# QUARTERLY RELIABILITY TRIAL.

Final of the Herts. County A.C. 1912 Series.

SCENES ON MAPLE HILL DURING THE SLOW HILL-CLIMB.

J. Oliphant (Premier) and C. W. Meredith (Bradbury).

W. F. Newsome making a wonderfully slow climb. He used a T.T. Triumph with Phillips pulley.

**L**AST Saturday, starting at 10 a.m. from St. Albans, the Herts County A.C. held their fourth and last trial of the year over the usual course, with the exception of Kop Hill, which was cut out at the last minute owing to the bad state of the surface. Twenty-six competitors faced the starter, the non-starters being P. C. Vestey (3½ Rudge), C. D. Wright (3½ Humber), and F. Begley (Enfield sidecar), who has been suspended by the A.C.U. for undertaking an unofficial trial. He therefore took our photographer round the course, the machine running splendidly throughout.

The weather was anything but perfect. It was raining at the start, but it cleared as the wind sprang up, which, during the morning, increased to a perfect hurricane. This must have given a great deal of trouble to the lightweight riders, as it was against them all day.

The first hill of note was Sundon, often used by the M.C.C. for hill-climbs. Most of the competitors came up very well, particularly Reg. Holloway (3½ Premier sc.). The failures were A. G. Cocks (2½ Connaught); Mrs. Hare (6 Enfield sc.), who had carburetter trouble all day and finally retired; C. Chatwyn (3½ Ariel sc.); W. Cooper (Humberette), who was suffering from a slipping clutch, and later in the day retired; and B. T. Rice Pyle (8 Bat sc.).

The next was Whiteleaf, but this ascent gave very little trouble, although the wind, which was now blowing harder than ever, was very trying. After Whiteleaf the route lay over a bad stretch of road to Aston Hill, where there was a fast climb, and most of the competitors, who, by now, knew the hill very well, experienced no trouble; the surface in winter is usually rather rutty. Near the foot of Aston W.

G. E. Cuffe (7 h.p. Indian sidecar) on Sundon Hill during the morning's ride.

V. Willberforce (G.W.K.). The 6 h.p. Enfield sidecar used by "The Motor Cycle" photographer is seen by the roadside.

First appearance of the two-stroke Connaught in competition. The machine was ridden by A. G. Cocks in the Herts County Trial last Saturday.

passed Holloway with a broken chain, which took so long to repair that it made him an hour late at the next check.

#### The Slow Climb.

After lunch there was a slow climb on Maple Hill; here Newsome found the benefit of his Philipson pulley, and made a star climb, going up at about four miles-an hour and being passed by three-speed machines. G. Baxter went up a lot too fast, and G. E. Cuffe was troubled again with his clutch slipping. Most of the others went up very well, especially A. E. Walker on his little Hobart-Precision. Below are the complete results:

#### Results of Saturday's Trial.

##### CLASS A.

	Marks.
A. E. Walker (2½ Hobart), bronze medal ...	193
C. E. Searle (2½ Douglas) ...	171
A. G. Cocks (2½ Connaught) ...	118

##### CLASS B.

W. F. Newsome (Triumph), silver medal ...	196
C. W. Meredith (Bradbury), bronze medal ...	187
J. Oliphant (3½ Premier) ...	179
Rex Mundy (3½ Triumph) ...	173
H. Berwick (3½ New Hudson) ...	163
H. L. Meyer (3½ Rudge) ...	162
E. C. Jarvis (3½ Triumph) ...	154

##### CLASS C.

E. A. Colliver (6 Zenith), bronze medal ...	199
R. G. J. Charlesworth (6 Zenith) ...	196

##### CLASS D.—Passenger motor cycles.

J. T. Wood (G.W.K.), gold medal ...	189
C. M. Keiller (G.W.K.), silver medal ...	177
A. W. Lambert (8 Morgan), bronze medal ...	176
V. Wilberforce (G.W.K.) ...	169
G. Baxter (6 Basil sc.) ...	144
R. Holloway (3½ Premier sc.) ...	111
G. E. Cuffe (7 Indian) ...	42

A. W. Lambert (8 h.p. Morgan runabout) climbing Maple Hill.

In Saturday's trial, E. A. Colliver (6 h.p. Zenith) carried off the silver trophy for the best performance of the day by a member of the trade. By the way, Colliver has ridden consistently in all four contests and would have annexed the Amateurs' Cup but for the fact that he has joined the trade in the interim.

R. G. Charlesworth, another Zenith rider, gains the trophy for the best performance of an amateur in Saturday's trial.

#### Results of the Four Trials.

	Total Marks.
1. F. W. Newsome (3½ Triumph), Trade Riders' Cup	782
2. E. A. Colliver (6 Zenith) ...	738
3. C. W. Meredith (3½ Bradbury) ...	700
4. R. G. Charlesworth (6 Zenith) ...	682
5. J. Oliphant (3½ Premier) ...	665
6. H. Berwick (3½ New Hudson) ...	660

PASSENGER MACHINES AT THE START. An Enfield sidecar followed by a Morgan runabout, a 3½ h.p. Ariel sidecar and G.W.K.

#### TIME TO LIGHT LAMPS.

Dec. 19th	...	4.50 p.m.
" 21st	...	4.51 p.m.
" 23rd	...	4.52 p.m.
" 25th	...	4.53 p.m.

#### Our Christmas Issue.

The next issue of *The Motor Cycle*, dated December 26th, and on sale before Christmas, will contain seasonable articles and illustrations.

#### A Petrol Substitute Wanted.

2,000 guineas is the amount offered by the Society of Motor Manufacturers and Traders as a prize for a home produced fuel which is capable of being put on the market at a commercial price and in sufficient quantities.

#### A.A. and M.U. Notes.

**A STOLEN MOTOR CYCLE.**—The Association has been informed of the theft of a member's motor cycle, on November 30th, from the county surveyor's department, Reading. The machine is a 1912 model, 2½ h.p., twin Douglas, engine No. 6619, frame No. 6370, registered No. BL2744.

#### Dangerous Corners.

Through the instrumentality of the A.A. and M.U. several dangerous corners and high hedges are receiving attention. Among the roads which will probably be improved are Chorley Wood Common to the Railway Station (Rickmansworth), Frimley and Farnborough road, and Coombe Hill on the Tewkesbury-Cheltenham road.

#### Speed Warnings.

Motor cyclists are warned of the vital necessity for the most considerate driving in and around Sevenoaks. There is considerable agitation in favour of a ten-mile limit being imposed in the district, and only by a display of the utmost consideration for other road users can motor cyclists prevent application being made for the scheduling of a considerable area.

The Wolverhampton magistrates have intimated their intention to deal seriously with cases of dangerous driving in the town.

#### Remarkable Speed.

The following paragraph appeared in the *London Mail* of the 14th inst.: "Young George Duller attained a speed of 110 miles an hour on his motor cycle at Brooklands the other day. A third of that speed would have got Koul home at Sandown." A reader asks, Has a motor cycle ever attained the speed of 110 miles an hour? The highest speed reached by a motor cycle on Brooklands track officially checked and timed is C. R. Collier's 91.37 m.p.h. on a Matchless-Jap on August 11th, 1911.

#### Where Motor Cycles Exceed Cars.

On September 1st last, there were registered in Denmark 4,507 motor cycles and 1,587 cars.

#### Indian Compositors' Slips.

The following advertisement appears in an Indian paper: "For sale, four-cylinder F.N. in splendid condition. *Not fire engine model.*" Another advertisement reads: "Beautiful *slop* soiled motor tricycle." The sender of the paragraph says that Indian compositors frequently cannot read, write, or speak the English language.

#### Ghent International Exhibition.

At the present time British goods of all kinds are in high favour in Belgium; therefore the Ghent International Exhibition, which is to be held next year, offers a fine opportunity for British motor cycle makers to gain a stronger hold on the Belgian market. The Board of Trade, Exhibitions Branch, Queen Anne's Chambers, S.W., points out that France and Germany are both erecting special pavilions at this exhibition, France having taken much more space than at Brussels.

#### SPECIAL FEATURES:

CONCERNING POWER UNITS.

NEXT YEAR'S TRIALS.

GOMETZ-LE-CHATEL HILL CLIMB.

#### Motor Cycle "Estafette."

Seven competitors took part in the motor cycle "estafette" (express ride) organised by the Auto Cycle Club de France on the 8th inst. The route was St. Germain, Pontoise, Palaiseau-Longjumeau, and back to St. Germain.

#### Christmas Holidays and Winter Runs.

Most large firms of manufacturers and dealers will close their premises for the Christmas holiday from Tuesday night till the following Monday morning. Those who intend to compete in long-distance winter runs or to take prolonged trips should therefore order any spares or clothing they may require by the end of this week at the latest.

Owing to Boxing Day being our usual publishing day, the next issue of *The Motor Cycle* will be on sale on Tuesday, the 24th inst.

FINAL QUARTERLY TRIAL OF THE HERTS COUNTY A.C.

Outside the control at Aston Hill. The competitors are H. Berwick, W. F. Newsome, J. Oliphant and another.

**London-Exeter Run.**

The Motor Cycling Club's London-Exeter winter run closes with a total of 164 entries—an easy record.

**Output of Cycle Cars.**

Last week Messrs. Humber, Ltd., turned out a record number of Hummerettes, the week's output totalling fifty-two. Several times fifty has been approached. In the new year the output will be greatly increased.

**Saturday's Cycle Car Trial.**

Among the entries for next Saturday's cycle car trial—the first of its kind—organised by the Sutton Coldfield and Warwickshire A.C. are two Perrys, two G.W.K.'s, a Morgan, Rollo, P.M.C., Motorette, and Humberette. The course measures approximately 100 miles, and includes Sunrising and Warmington hills in the morning route, and Edge Hill on the return journey from Banbury.

**Antipodean Road Race.**

The West Australian M.C.C. recently carried through successfully a 150 miles motor cycle handicap on lines described as somewhat similar to the T.T. Race. The winner turned up in Lewis, who rode a 2½ h.p. N. Hudson and negotiated the trying course in 4h. 23m. 58s. He used Dunlop tyres. Fastest time was made by F. Baker (3½ h.p. Rudge), 3h. 56m. 43s. The event created great interest in Perth and all along the route.

**Outputs Sold.**

The Swift Co. and Perrys have sold the whole of their 1913 output of cycle cars, which remarks also apply to the Singer. It is worthy of special mention that the cycle cars mentioned were each first illustrated and described in these columns, and, in fact, *The Motor Cycle* is the only journal to have published detailed illustrated descriptions of the three cycle cars named. We give the dates for reference purposes: Singer, August 29th; Swift, November 7th; Perry, November 21st.

**A.C.U. Notes.**

**UNOFFICIAL ROAD TRIALS, SUSPENSION.**—The A.C.U. has decided to suspend the registration of F. Begley from the 10th inst. to the end of the year, on account of his having taken part in an unofficial road trial a few weeks ago. His passenger will also be held to be incapable of holding registration for the same period.

**PERMIT GRANTED.**—A permit has been granted to the Bournemouth and District M.C.C. for a reliability trial on January 8th over a course measuring 128 miles. The Noble Iddon trophy, which is competed for during the trial, will be awarded to the rider gaining the highest number of marks.

**MISLEADING ADVERTISEMENTS.**—The attention of the A.C.U. has been called to misleading advertisements published in the motor cycle papers, and steps are being taken to remedy the matter.

**THE 1913 COMPETITION PROGRAMME.**—The Mersey M.C. (Liverpool) have booked the following dates for competitions during 1913: March 21st, May 12th, June 27th and 28th, August 4th, and October 28th.

**FUTURE EVENTS**

Dec. 21.—Sutton Coldfield and Mid-Warwickshire A.C. First Cycle Car Trial.

„ 26.—N.W. London M.C.C. Open Winter Run to Gloucester and Back.

„ 27-28.—M.C.C. Annual Winter Run to Exeter and Back.

1913.

Jan. .. —A.C.U. Open Silencer Trial.

„ 18.—North Middlesex M.C.C. Open Trial.

Mar. 1.—A.C.U. Open One Day Trial.

**Novel Fittings.**

One of the Alcyon machines which competed at the Gometz hill-climb not only had double the usual number of valves, but was fitted with two carburettors. It is said that two heads are better than one; possibly the same applies to carburettors.

**Cairo to Alexandria.**

Three Englishmen, on motor cycles, recently rode from Cairo to Alexandria and back, a distance of over 337 miles. The roads are said to be the worst in Egypt. The ride was held under the auspices of the Cairo Sports Club. One of the competitors, J. Price, rode a 3½ h.p. Mead, and on the journey used eight litres of petrol and one litre of oil, and attained a maximum speed of 46½ miles an hour.

**Nice La Turbie Hill-climb.**

The above event was decided on the 15th inst., and drew an entry of twenty-eight competitors. The contest was divided into two classes—those who competed for a club challenge prize, and a purely speed event. The results on speed are: 1st, Yenne (Escoffier-Kochler), 7m. 28½s.; 2nd, Agnero (Peugeot), 7m. 50½s.; 3rd, A. J. Dixon (Singer), 8m. 13½s. The climb is about four and three-quarter miles in length, and comprises several hairpin bends and sharp turnings.

**Bound for the Antipodes.**

P. Weatherilt, the well-known Zenith exponent, is leaving for Sydney with S. L. Bailey to-day (Thursday).

**Motor Cyclists and Charity.**

The Brookdale Club, Catford, is providing a Christmas dinner and entertainment to 300 of the poorest children of the district at its headquarters, Catford. Last Christmas over 200 children were the guests of the club.

**The London-Gloucester Run.**

In addition to the entries for the N.W. London M.C.C. Gloucester run given on page 1529, the following entries have been received: Elswick Co. (Elswick), James (Triumph), Strickland (James), Fletcher (Douglas), Dreydel (Ivy sc.), and Jeffery (Whitgift cycle car).

**Class B Records Broken.**

Late on Tuesday afternoon we received a telegram from the Brooklands Track informing us that S. L. Bailey, on his Douglas, fitted with A.B.C. steel cylinders and fittings, had broken the Class B records for the mile and kilometre. The speed for the kilometre was 72 m.p.h., and for the mile 70 m.p.h.

**Guide Cards through Towns for Motorists.**

To enable motorists to find their way through towns and cities where it is often difficult to follow the main roads the Automobile Association and Motor Union has prepared a series of cards showing selected routes through a large number of towns and cities. These plans are based upon the Ordnance Survey, and, in addition to indicating "recommended" routes, indicate other main roads carrying heavy road traffic which are best avoided. The cards are being distributed to members, upon request, from the head offices and branch offices of the Association. A few towns in respect of which guide cards have been prepared are: Brighton, Burton-on-Trent, Canterbury, Carlisle, Chelmsford, Chester, Colchester, Coventry, Doncaster, Harrogate, Lancaster, Leamington, Newcastle-on-Tyne, Preston, Reading, Stamford, Warwick, York, and further towns are being dealt with.

The English riders who went over to Gometz-le-Chatel to compete in the hill-climb last Sunday. From left to right: W. Pratt (3½ h.p. P. & M. sidecar), H. C. Mills (3½ h.p. Green-Zenith sidecar), F. W. Barnes (3½ h.p. Zenith), and W. G. McMinnies (3½ h.p. Triumph). In the background may be seen Mr. T. W. Loughborough, H. P. Beasley (A.C.U.), and E. M. P. Boileau ("The Motor Cycle").

## THE LITTLE SALON.

**A**FTER the Grand Salon de l'Automobile, the Petit Salon was distinctly disappointing. There were only a few cycle cars and one make of motor bicycle to be seen.

The La Roulette cycle car was not without interest, though not shown as a final model. The chassis was of pressed steel, and the motive power a twin water-cooled engine, thermo-syphon circulation, and fed with gas from the new type Longuemare carburetter. The transmission was by chain to the counter-shaft, which carried a leather-to-metal friction clutch and a differential. The final drive was by belts, the rear wheel sliding forward and giving the free position and applying the brake. The model shown had no change speed gear, but we understand that in future models the front pulleys will be of the expanding type. Two brakes are fitted, one of which is applied to the counter-shaft by means of a pedal, the other acts upon belt rims on the back wheels, and is operated by a lever which forces the wheels back. The springing on semi-elliptical springs fore and aft appeared to be very good. The chassis shown with body was also interesting. The seats were arranged tandem fashion, and afforded plenty of room. The front seat would accommodate an adult and a child, while the rear seat would take two adults at a pinch. The coachwork and upholstery were distinctly good. The firm showing La Roulette also showed Kempshall tyres, and were agents for the Sarolea motor bicycle. This latter was shown in two sizes—2½ h.p., 66 × 86 mm., and 3½ h.p., 85 × 88 mm. Both models were built in strict conformity with English ideas, and were fitted with Armstrong three-speed gears and B. and B. carburetters, the whole bearing a very distinct resemblance to a well-known English make.

### Another Friction-driven Runabout.

The La Flèche on En dus Jack, 16, Av. Pereire, Astrière, was a friction driven vehicle with a patent device for varying the pressure of the disc against the friction wheel. It was provided with a lever for starting the engine from the driver's seat, which also, when pushed

8 h.p. Fleche which has a single-cylinder engine and tandem seats.

forward, applied the rear brakes. The motive power was a water-cooled 8 h.p. Buchet engine, or a 14 h.p. Chapuis Dornier could be fitted to order. It was shown fitted as a three-seater, the seats being arranged tandem fashion. The back seats were made detachable so that a tradesman's box or racing tail could be fitted. The final drive to the near side rear wheel was by chain. The next item of interest was a tandem seated tricar or three-wheeled cycle car of tremendous length and fairly substantial weight—La Torpille, Perrin et Cie., Annonay (Ardèche). The motive power was a 14 h.p. Chapuis Dornier engine, cooled on the thermo-syphon system by means of a multi-tubular radiator arranged on the Renault principle in front of the dash. From the engine to the three-speed gear box the drive was through a friction clutch and propeller-shaft, the final drive being by chains. The back portion was sprung, the rear wheel being carried in an inner frame. The front portion was suspended on full elliptical springs, the upper leaves of which were clamped on to the upper portion of the chassis. Other points of interest were that the change speed lever worked in a gate and the back wheel was shod with twin tyres. Among the other exhibits were an old and respected friend in the form of an A.C., and the Baby light car lately described in these pages. The latter looked a well-finished and sensibly designed vehicle.

### PILOT SIDECAR.

The Pilot Motor and Cycle Co., Soho Road, Handsworth, Birmingham, exhibited several types of sidecars at the Olympia Show last month. One of the models was provided with a hammock springing suspension to the body; the side members were extended behind the body, and at each end were shackles to which long springs were attached. Bolted to these long springs were ordinary C springs on which the body was carried; underneath were two spiral springs supporting the C springs and fastening them to the chassis. The result is that the body is most luxuriously sprung.

Another feature was the four-point suspension, the sidecar frame was, of course, attached to the saddle tube and close to the rear axle of the bicycle, but it was also fastened at two points to the bicycle down tube. The body had a well-padded back and a lid fastening over the front portion on which were pockets for maps.

Another model was the Safety sidecar. The chassis had two longitudinal members on each side, one above the other, and the wheel was carried in a fork. The model shown possessed the ordinary type of C springs, but if it is desired to use a lighter model, a coil spring arranged fashion could be fitted, which saves a good deal of weight. An efficient grid luggage carrier was situated behind the chassis.

La Torpille tandem seated voiturette, which is propelled by a 9 h.p. four-cylinder engine.

Pilot sidecar frame and springing, showing luggage grid and the now popular four-point attachment.

# THE GOMETZ HILL-CLIMB.

British Riders secure Three Firsts.

UNFORTUNATELY, owing to the differences existing between the Federation of French Motor Cycle Clubs, the entry at Gometz did not assume the same proportions as last year. The total entry amounted to thirty-three, of which six were English, and of these Griffith and Rogers were missing. Our readers will remember that the course is up a perfectly straight hill through the village of Gometz-le-Châtel. The road was admirably policed by *gens d'armes* and *gardes-champêtres*. Unfortunately the weather was not too favourable, as just before and during the competition there was a slight rainfall, which increased until the hill climb was over. The road surface was smooth but covered with thick mud, which had a decidedly retarding effect on the machines. The English competitors had crossed over by the 9 p.m. train on Friday, and after a rough crossing *via* Calais reached Paris in the early hours of Saturday morning. Mr. H. P. Beasley, assistant secretary of the A.C.U., travelled with the party. The chief objection to the Calais service is that the machines are placed on deck, but they were covered with a tarpaulin and did not suffer any appreciable damage. Most of the competitors who stayed at the Hotel de Grand Brétagne went to the Salon in the morning, some attended the International Conference, and others visited the Petit Salon and other places of amusement during the afternoon and evening.

## On the way to the Course.

An early start was made for the train to Bures. As the line runs below the level of the road from the Gare de Luxembourg, the first station level with the ground, Gare de l'Enfert, had to be reached. Here the railway people behaved splendidly, and to aid the men a lady came up and did yeoman service as interpreter. Bures is a tiny station about three-quarters of a mile from Gometz, at which a woman fills the several posts of station-master, ticket-collector, and porter. Here M. Longuemare and M. Plazolle, secretary of the A.C.F., brought cars to convey several of the English delegates to the scene of the hill-climb—a kindness which was much appreciated. The weighing in took place in a farmyard, the clerk of the scales being M. Buissard. The course was 800 metres in length, and A.C.F. timekeepers were stationed at the foot and at the summit of the hill, the maximum gradient of which was approximately 1 in 12. There did not appear to be a great improvement in the French machines since the hill-climb last year, but signs of the influence of the English designs were not entirely absent.

## Novel French Machines.

Several French machines presented points of interest. One of the Alcyons possessed not only four valves in the head, but two separate Claudel carburetters. It was also provided with a mechanical oil pump delivering oil through a sight feed to the big end and main bearings.

One of the René Gillets, we noticed, possessed a flat belt, while one of the competing Alcyons had a new spring device on the mainshaft for absorbing the shock of impulses of the engine. A curious machine was the Albatross, which had overhead valves; to provide clearance for the valve rockers the lower horizontal frame tube had been cut away to half its normal thickness. It possessed a huge oil pump, and had a bore and stroke of 76 x 110 mm. Consequently the cylinder was tremendously tall. An Austral tricar was provided with a whip for chastising the savage French dogs.

## The Competition.

The ascents were all made without incident, though several competitors swerved in the mud, which, however, was too heavy and wet to be dangerous. The ascent of Barnes (Zenith) in the 1,000 c.c. class was impressive, and Pratt (P. and M.) made a very good performance. The Clement machines, especially that with the new 3½ h.p. Motosacoche engine, were much admired and are clearly the most up-to-date of the French machines.

Numerous English spectators were present, among whom we may mention Messrs. T. W. Loughborough, W. H. Wells, T. H. Tessier, and F. E. Baker and H. Collier, sen., who arrived too late for the competition, which when once started was very quickly run off. The results were as follows:

### CLASS I. (up to 250 c.c.).

	m.	s.
1. Stoeffel (Alcyon) ... ..	0	42½
2. Canale (Alcyon) ... ..	0	50
3. Bange (Terrot) ... ..	1	7½

### CLASS II. (up to 350 c.c., single).

1. Lehmann (Alcyon) ... ..	*0	74½
2. Franquebalm (Terrot) ... ..	0	40
3. Dacier (Austral) ... ..	0	43

### CLASS III. (up to 350 c.c., multi.)

1. Lacroix (Peugeot) ... ..	0	41
2. Fenton (Clément) ... ..	0	49½

### CLASS IV. (up to 500 c.c., single).

1. W. G. McMinnies (Triumph) ... ..	0	35½
2. Lombard (Albatross) ... ..	0	35
3. F. W. Barnes (Zenith) ... ..	0	39

\* Fastest time of the day.

In this class Mills (Zenith-Green) made the ascent in 38s., but was disqualified, as his entry had not been received in time.

### CLASS V. (up to 500 c.c., multi).

1. Perrin (Peugeot) ... ..	42½	s.
2. Fenton (Clément) ... ..	45	s.

### AMATEUR CLASS.

Baudry (Clément) ... ..	55½	s.
-------------------------	-----	----

### SIDECARS.

#### CLASS I.—No entrants.

#### CLASS II. (up to 500 c.c.).

1. F. W. Barnes (Zenith) ... ..	54	s.
2. Fenton (Clément) ... ..	1m.	4s.
3. W. Pratt (P. and M.) ... ..	1m.	7s.

#### CLASS III. (up to 1,000 c.c.).

1. F. W. Barnes (Zenith) ... ..	41½	s.
---------------------------------	-----	----

### CYCLE CAR CLASSES.

Bourbeau (Bedelia) ... ..	1m.	5½s.
Bonville (Bedelia) ... ..	1m.	4s.

The scarcity of cycle cars was due to the A.C.F. introducing a new regulation which ruled out the heavier types. Happily, however, this was altered at Saturday's meeting, and the limitations are now the same as ours.

As last year, a trumpeter turned up at the start, but this time his services were not employed. After the hill-climb several prominent members of the A.C.U. were entertained to lunch by the A.C.F., whose officials as usual extended a hearty welcome and were most hospitable.

— Lehmann (four-valve single-cylinder Alcyon), who made fastest time of the day at the Gometz-le-Châtel hill-climb, beating 8 h.p. twins. This type of engine was used in the last T.T. race.

# The Congress of the F.I.C.M. in Paris.

International Trial in England next year, and in France in 1914.

ON Saturday the second meeting of the International Federation of Motor Cycle Clubs took place at the Automobile Club de France, Place de la Concorde. The delegates were received by the Baron de Zuylen de Nyvelt, the Chevalier René de Knyff, the Comte de La Valette, and Messieurs Longuemare and Fenton, sen. The representatives of the different countries were then entertained right royally at luncheon by the Automobile Club of France. At the conclusion of the luncheon, the Baron de Zuylen expressed great pleasure at the Federation having chosen the A.C.F. as the meeting place of the second conference. After a brief interval those present adjourned to the committee room. In addition to those already mentioned, Messieurs Fenton, jun., Hugo Storr (chairman Touring Moto Club of France), and Debuilly (chairman Auto Cycle Club of France). England, Messrs. Boileau, Tessier, Pratt, and Loughborough. Belgium, Messrs. Beukelar, Michant, Guillot, and Fagard. Holland and Denmark, Mr. R. toe Laer. Switzerland, Messrs. Mégevet and Neper. Italy, the Marquis Ferrero di Ventimiglia. The United States and Canada, Mr. W. H. Wells. Austria, Mr. Fasbender. Germany, Mr. M. D. Hein.

## An International Trial.

At the beginning of the meeting the Baron de Zuylen took the chair, but later vacated it in favour of the Chevalier René de Knyff. After Mr. Loughborough had read the minutes of the last meeting, Mr. E. M. P. Boileau, speaking in French, and on behalf of The Auto Cycle Union proposed that the international trial for 1913 should be run in connection with the first section of the A.C.U. trials in the North of England. He further suggested that each country should send a team of three riders, and each competing machine should be painted a distinctive colour, the riders to carry armlets and a rosette of the same colour. These colours, which were ultimately accepted, were the same as those employed in the Gordon-Bennett Races, and were, with some additions, as follows: England, green; France, blue; Germany, white; America, white and blue; Belgium, yellow; Spain, yellow and red; Austria, red and green; Italy, red; Switzerland, red and white; Denmark, green and white. In conclusion, Mr. Boileau extended a hearty welcome to the teams on behalf of England, and hoped that the best team would win. (Applause.)

There then ensued a lively discussion, during which everybody tried to speak at once. France claimed priority of dates for the Grand Prix races in July, which clashed with the A.C.U. Trial, and Belgium claimed the week after for its races. After further discussion, it was decided to hold the international trial in England over four days, about September 22nd. The distance is to be 1,000 kilos., 250 kilos. per diem, and the A.C.U. is to draw up separately the rules, while it was also decided to hold the 1914 trial in France.

The rules of the Federation were then passed, the only alteration from the draft submitted by the A.C.U. being that the annual subscription for each country was reduced to 150 francs (£5).

The style of road surface which is encountered in various parts of Holland.

The next procedure was the appointment of a sub-committee to consider the rules of the A.C.F. affecting the classification of motor cycles, and their application internationally. The sub-committee, consisting of Messrs. Longuemare (chairman), Boileau, Fasbender, toe Laer, Wells, Guillot, Mégevet, and Hein, then proceeded to business at once. A lengthy discussion followed, which lasted till seven o'clock. These rules were divided as follows: For motocyclettes, known as two-wheelers, i.e., motor bicycles in England. Motor cycles, i.e., motor bicycles and sidecars or cycle cars. It is interesting to note that the basis of the A.C.F. regulations was the A.C.U. rules; but the chief differences were soon brought into line with the A.C.U., so that all the countries represented will work under practically the same regulations.

THE GOMETZ-LE-CHATEL HILL CLIMB. (See previous page.)

H. C. Mills (3½ h.p. Green-Zenith sidecar), who was disqualified, as his entry had not been received in time.

F. W. Barnes (3½ h.p. Zenith) travelling well. He won Classes 2 and 3 for sidecars.

A lecture on "Carburation" was given by Mr. Charles Binks before the Denton M.C.C. on the 10th inst., and the next evening before the Leeds M.C.C. The paper was much appreciated.

Mr. T. E. Patchett has been appointed "commercial manager and secretary" to the Enfield Cycle Co., Ltd. Mr. Patchett has been with the company for sixteen years, and for several years past has held the position of secretary.

## From London to Le Mans.

**L** E MANS, the scene of one of this year's French road races, is not very conveniently situated. To reach it by rail from England it is necessary to go to Paris and change, consequently the way is by motor cycle over the most direct road. As soon as I heard I was to go there I rang up a friend who was keenness itself when he heard of the proposed trip, and in a short time all was fixed up.

### The Start.

My mount was a brand new  $2\frac{3}{4}$  h.p. Douglas, only delivered the day before, and consequently, so far as I was concerned, untried, and up to the time of starting I was busy fixing number-plates and other odds and ends. Among the latter was the G.B. plate, which everyone who holds the much too bulky International pass must attach to his rear number-plate. This is now made of heavy enamelled iron, as several people have complained to the Royal Automobile Club of the flimsiness of the old kind. The light plate, though not so smart to look at, is practical, and the new one, though it is everything as regards appearances, is too heavy and requires to be fixed very securely. Thanks to the efficiency of the R.A.C. Touring Department, to which motor cyclists have full access through the Auto Cycle Union, the preparations were soon over, and when the buckle of the last strap had been tightened we were off for Newhaven. Dodging tramlines and traffic by sundry back ways, we avoided the whole of Croydon, and at Purley Corner struck the main road. Here a stop was made to tighten up my rather heavy bag, which was enveloped in a waterproof cover, and to which a pair of Hutchinson boots and a macintosh were attached. When the trick of fastening the straps on tightly and securing the ends together was learned everything kept taut. Despite its newness, the little machine pulled well, and an excellent run was made to Lewes, on the outskirts of which a stop was made to light the lamp.

### Dinner at Lewes.

Here we stopped for dinner at the Bridge Hotel and met our companion, who had arrived on his Triumph only two minutes before. The remainder of the journey over the twisty road to Newhaven was not too pleasant. This disgraceful lane is under the consideration of the Road Board, and the sooner that body gets it straightened out the better. It is positively dangerous for any who do not know it to traverse it by night. We had timed our arrival well, and there was plenty of time to empty petrol, weigh the machines, shorten my belt, and see the machines safely stowed. My companion is a sailor, and his practised eye soon told him that the machines as stowed would roll into one another all night, so one was placed fore and aft and the other athwartships. I must congratulate the L.B. and S.C. Railway Co. on their care in covering the motor

bicycles up and making them secure for the voyage. In fact, on both the outward and homeward journeys the machines were most carefully handled on both sides of the Channel.

After a comfortable but rather rough crossing we arrived at about 2.30 a.m. and found that the man with whom we had arranged for petrol had failed us, and all we could get was five litres from a porter, who charged us three francs. Our lamps though lit before burned brightly, and knowing my way out of the town I swung out on to the front, turning left at the extreme end and up the steep hill and on to the road to Rouen, which was in fairly good order. One has to be careful to take the right hand fork at the top, as the other road goes north of Paris.

### A Short Halt for Adjustment.

At the first village we found a level-crossing with the gates shut, but fortunately the old man in charge was awake and let us through. All went well until an ominous noise from the front wheel told me something was wrong. An inspection revealed it to be a loose cone, due I may say in justice to the makers to my own fault. I had had to remove the wheel to fix the front number-plate, and in replacing it had put a washer back wrongly. Luckily, all the balls were retained, and thanks to the skilful help of my friend we fixed things up. Meanwhile dawn had broken, and a quick run over a good stretch of road followed which brought us to the outskirts of Rouen, the *pavé* being of the worst description. After breakfast it was not quite so bad, but on the way to Grande Couronne the road possessed no surface at all. We had both been going pretty hard when we suddenly struck a section which was completely worn out, no other words can describe it, and we both narrowly escaped a bad toss. The next incident was that probably owing to the surface our minds were so much occupied that we found ourselves five miles out of the way beyond Bourg-Achard, where a kindly motor car driver put us right.

### Morning and Better Roads.

The roads were now excellent, the sun came out, and with the wind behind we made splendid progress through old-world market towns and along tree-lined highways through Brionne, Bernay, and on to Gacé. Mostly on the level, but at times climbing long hills, up which the little one needed nursing, as the hard work and her new condition caused symptoms of overheating at times. The way out of Gacé was somewhat complicated, and after we had gone two or three miles we consulted our maps and a signpost. Meanwhile a cyclist came along and my friend addressed him in a mixture of French and English. The cyclist replied in a mixture of English and French, and presently turning to me said, "Sprechen Sie Deutsch?" To which I replied, "Ein bischen" (a little) in fluent

### From London to Le Mans.—

Teuton, which fairly started him. However, he got ahead of me in German, and I had to ask him to re-lapse into French, which I know fairly well. To make a long story short he put us in the right direction, and after covering the distance quickly we struck Route Nationale No. 138 and reached Alençon, where we enjoyed a well earned lunch and a rest. The road to Le Mans was somewhat rough, but we soon got there, arriving at about 2 p.m.

### The Town en fête.

The race has already been described in detail. It was the best Continental road race of the year, and resulted, as our readers will remember, in two British wins, that of Devay on Newsome's Triumph in the 500 c.c. class, and that of Bailey in the 350 c.c. class. It is interesting to record that I saw Bailey's engine taken down at Brooklands for the first time after the great race. Though naturally over-oiled all the time, there was very little carbon deposit and not a shake was traceable in any of the bearings. Mr. Mellano, the late London manager of the Hutchinson Co., was an interested spectator, who rejoiced greatly at the British triumphs.

The evening before the car event the whole town of Le Mans was *en fête*. In the great square, the Place de la République, were thousands of people, many driving cars and cycle cars without cut-outs and making a most unearthly din. In one corner there was a space roped off for fireworks, while the two chief objects of interest in the square were the bandstand, where a full military band discoursed sweet music, and the statue of Jauréguiberry brandishing his sword. It was indeed a lively scene. As the evening wore on the crowd of pedestrians increased and the vehicles became fewer in number.

### Fireworks Galore.

As I had had a long journey the day before and was up at five o'clock that morning, and I had to be up again at five the next morning, I went to bed, but had no sooner put out the light than a deafening report sent me out of bed and to the window with a rush. *Les feux d'artifices* had begun, and very good they were. Rockets and shells shrieked through the air, and rocket sticks and sparks fell on the roofs of the adjoining houses, but everyone was much too happy to care. The show ended, as I thought, with a fine set piece of a racing car with wheels that revolved and *Coupe de la Sarthe* written beneath it in letters of fire. So I went back to bed and to sleep. In five seconds my room was lit up as bright as day, and to the window I rushed again. Jauréguiberry's statue was a mass of flame, to every spike of every railing was lashed a firework, while to his sword arm was tied a stake to which a bunch of fireworks was attached. It was a grand sight. Then a deafening series of explosions, and all was quiet. That afternoon I had met a keen French motor cyclist who spoke perfect English, and, pointing out to him that he had no silencer, he remarked, "You see I'm a Frenchman and I like noise." He spoke the truth—they do.

On the next day at the car races there were many more people. The car race was a most impressive affair. The high speed of the competing vehicles and

the numerous incidents at the depots rendered it most attractive.

### The Return Journey.

We left Le Mans at 3 p.m., and this time took another road back to Dieppe in search of better surface. We began by ascending steadily out of the town and entering fine hilly country we continued to Bellême, at the outskirts of which the Triumph punctured, the only trouble my friend had throughout the trip. The Douglas ran regularly but without power, and as we were racing against nightfall there was only time to adjust a tappet and none for further investigations. So we pushed on all we knew, passing through Mortagne, after which it became bitterly cold, and then entering Verneuil, where the *pavé* is of the vilest. Between this place and Nonancourt the road was somewhat rough, but on the whole its general condition was better than that by which we came, and, moreover, we never once lost our way. The last lap in the twilight was over a plateau on an absolutely straight and smooth road. Two kilometres from

On the way to Le Mans. A stop for lunch at Alençon.

Evreux we stopped to light up, and on asking for water for the lamp it was brought in a bucket. We were indeed glad to see the lights of Evreux and the welcome doors of the Hôtel du Grand Cerf. We had been up at a quarter to five, and between 3 p.m. and dinner time had covered eighty-five miles.

### A Choked Silencer.

The next morning we had a splendid run unmarred save by the *pavé* in Louviers and Rouen. Near the latter place, as we were in good time, I glanced at my silencer, and there saw the cause of the loss of power at a glance. Almost every hole was sooted up, owing, of course, to too liberal a supply of oil to the new engine. When the silencer was clean the old healthy bark returned, and the kilometres swept quickly by. In Tôtes, as I was short of oil, I purchased a tin of Huile A.D., not quite so thick as Price's or Vacuum, but of a respectable consistency, and, though I put it in with some misgiving, I found it suited the engine excellently. Then on to Dieppe and on board the *Brighton*, which brought me comfortably back to England. Thus ended one of the most eventful, interesting, and enjoyable week-ends I have ever spent. E.M.P.B.

## Essex M.C. Annual Dinner.

Although some few members were in France at the Gometz-le-Chatel hill-climb no fewer than 120 members and guests were present at the annual dinner of the Essex Motor Club on Saturday last at the Great Eastern Hotel.

The Chairman (Mr. Stenson Cooke) in proposing the health of the club, referred at length to the work of its president—Mr. S. G. Cummings—which had gone far to make the club the successful body that it was at the present time. He coupled with the toast the names of Messrs. A. P. Howard and E. J. Bass. He also made a deserved tribute to the past work of Mr. A. G. Reynolds and a reference to Mr. Owen Summers (now in America) and Mr. F. A. Applebee, sen., who was present. Mr. E. J. Bass gave some instructive figures concerning the position of the club, which now numbers 150 members—an increase of 68 on the year. He pointed out that the club was distributing a large number of prizes.

Among those to receive prizes from the hands of the chairman was F. A. Applebee, jun., winner of the Senior Tourist Trophy Race. Mr. R. Selz proposed the health of "The Visitors, Ladies, and Press," to which Mr. H. Rutter and Mr. Whittall, in the absence of Mr. Douglas Leechman,

replied; while Mr. S. G. Cummings proposed the health of "The Chairman," which duly elicited a response. Interspersed with the speeches were the varied items of an admirable musical programme.

1913 3½ h.p. single-cylinder Indian with spring frame and kick-starter.

## North-West London M.C.C. Annual Dinner.

A company of about sixty sat down to the annual dinner at the Richelieu Hotel on Saturday last, the number being augmented later in the evening. Mr. J. W. Thomas (Hippo-Pa-Thomas) acted as chairman. The proceedings passed off in the happy family spirit associated with the club's functions, the usual toasts being interspersed with musical items, among which special mention may be given to Miss Thomas's two contralto songs, the glees of the St. James's Glee Singers, and the humour of that other old favourite, Mr. Cotchin. The Chairman, in a happy speech, when toasting the club, gave a *résumé* of the year's proceedings with a tribute to the work of the officials. Mr. Pooley, in reply, called on the club to select carefully their officials for the coming year to take the place of the rather large number who are compelled to vacate office. Club life must continue on other lines than a purely competitive programme in future if clubs are to last—the perfection of modern machines is undoubtedly weakening the sporting side of competitions run on the stereotyped lines. The new challenge cup presented by Mr. E. Gwynne is a most handsome piece of

plate in silver gilt. The trophy is a perpetual one, and was gained for the first year by H. J. Pooley. The Thomas Cup fell to H. Karslake, and in all about 250 prizes and medals were presented to the successful competitors by Mrs. J. W. Thomas.

## ANNUAL LONDON-GLOUCESTER RUN.

Entries for the annual twelve hours open trial of the North-West London Motor Cycle Club are coming in satisfactorily, and it has been decided to extend the closing date for entries until to-morrow, the 20th inst. We are asked to state officially that entries posted to-day, Thursday, the 19th inst., will be accepted at the ordinary fee 12s. 6d. and should be addressed to Mr. H. E. Taylor, 17, Taverton Street, Gordon Square, W.C. This concession is in order to allow motor cyclists who see the notice of the event for the first time in this journal still to partake in the run. Later entries can only be accepted at double fees and if posted at the latest on Saturday, the 21st inst. This event marks the anniversary of the first open winter run under A.C.U. permit, the corresponding event last year being the first of its kind. The North-West London club events are always carefully organised, and as the winter run is free from irksome conditions, it should be an excellent holiday fixture.

The following is an early list of entrants received up to last Tuesday:

Rider and machine.	Rider and machine.
W. C. Knight (8 Zenith sc.)	Chas. Janicker (Rudge Multi)
W. Cooper (8 Humberette)	J. Beal (—)
H. F. S. Morgan (8 Morgan)	G. Nott (8 Matchless sc.)
R. Scott (3½ Triumph)	E. Rose (7 Indian)
Frank Thomas (7.9 G.N.)	C. L. Mowbray (3½ James sc.)
Osmond Hill (8 G.N.)	W. Ford (—)
G. D. Hardee (3½ Triumph)	H. J. Pooley (3½ Premier)
C. Meredith (3½ Bradbury sc.)	V. Garland (5-6 Clyno sc.)
R. G. Mundy (8 G.W.K.)	C. A. Werner (6½ N.S.U. sc.)
J. Cocker (4½ Singer sc.)	P. A. Goddard (2½ Douglas)
D. R. O'Donovan (4 Singer sc.)	Claude Rose (7 Indian)
A. A. Brinkman (5-6 Clyno sc.)	H. E. Taylor (5-6 F.N. sc.)
W. O. Oldman (3½ Bat)	C. J. Burton (10 Mors car)
M. P. Gibbins (Rudge Multi)	

THE AGGREGATE CUP WINNER.

W. F. Newsome (Triumph), who in the four Quarterly Trials of the Herts County A.C. has easily scored top marks.

In the description of the Moto-Rève exhibit at the Paris Show in our last issue, we inadvertently mentioned that the Moto-Rève Co., Ltd., Alpertown, Middlesex, were the British agents for this make of machine, whereas the English Moto-Rève Co. is an entirely British concern, manufacturing the whole of its machines in England with the exception of the engine, and using English frames and fittings.

**Brookdale Club, Catford (Motor Section).**

The annual dinner will be held at headquarters, Brookdale Hall, Catford, this evening (the 19th inst.)

**Birmingham M.C.C.**

The smoking concert on Saturday last, at the Imperial Hotel, was well attended, and the evening proved most enjoyable. Mr. F. Lewis occupied the chair. The arrangements were admirably carried out by Mr. S. K. Jones.

**Surrey M.C.C.**

A penalty run will take place on Boxing Day, starting at 10.15 a.m. Route: Guildford, Godalming, Petworth, Arundel, Littlehampton, and return. Distance, seventy miles. The annual general meeting will be held on January 14th at headquarters.

**Brighton and Hove M.C.C.**

An enthusiastic meeting took place on Tuesday, December 10th. A committee was elected, with Mr. C. C. Spurin as chairman, and a club was duly formed with a membership of thirty. All interested are invited to communicate with the secretary, Mr. E. S. Northam, 52, Norfolk Square, Brighton.

**Manchester Amateur M.C.C.**

The annual dinner and prize distribution was held on the 12th inst. at Ingham's Hotel (Whilloughby's). There was a good attendance of members and friends, the chair being taken by the captain of the club, who distributed the prizes to the successful members. The prize winners were: Gold medals, S. H. Y. Birley, R. Birkett, and H. D. Ashworth; silver medals, R. N. Earwaker and J. McCann; special prizes, F. Taylor, jun., H. Marsden, T. L. Timperley, and J. McCann.

**Liverpool A.C.C.**

The annual supper and prize distribution of the above club were held on the 11th inst. in St. Margaret's Hall, and were attended by between seventy and eighty members and friends. The speeches were cut down to a minimum, and even then the evening's programme was not completed until 11.30. During the evening prizes were offered by the following for competition next year: Messrs. Lamb, Great-wich, Copland, Smythe and Wade, the Mead Motor Co., Pobjoy, Phillpott, and Baxter.

**Luton and South Beds M.C.C.**

The first annual dinner took place at the Red Lion Hotel on the 14th inst. The chairman, Major E. W. Brighton, announced that cups had been given to the club by Captain H. Green (president) and Mr. Harold Karslake, the latter to be called the Dreadnought Cup.

**Western District M.C. (London).**

The annual supper and prize distribution took place on the 4th inst. Mr. M. G. Tweedy, the retiring honorary secretary, was presented by the club with a cakestand. A committee meeting was held on the 8th inst. Hon. sec., Mr. E. S. Ritter, 27, Ennismore Avenue, Chiswick.

**Bristol B. and M.C.**

The annual supper was held at the Full Moon Hotel on the 7th inst., when about forty members were present. A pleasant evening was spent, the usual toasts being proposed and acknowledged. The speeches were interspersed with songs and music and by the presentation of prizes, something like thirty prizes and medals being distributed.

**Exeter and District M.C.C.**

The third winter reliability run from Exeter to Penzance and back, for motor cycles, sidecars, and cycle cars, will be held on Saturday, January 11th, 1913. Regulations.—The first machine will start at 7 a.m., and the route will be: Exeter, Moreton, Two Bridges, Tavistock, Callington, Liskeard, Lostwithiel, St. Austell, Truro, Redruth, Camborne, Hale, and Penzance. The speed from Exeter to Penzance and from Penzance to Liskeard will be calculated at twenty miles per hour. The speed from Liskeard to Exeter will be reduced to fifteen miles per hour. Cycle cars must not exceed 7 cwt., unladen.

**Dublin and District M.C.C.**

A company of members and friends, numbering a few short of one hundred, sat down to the third annual dinner of the Dublin and District Motor Cycle Club on Saturday evening at the Dolphin Hotel, the chair being filled by Mr. F. A. Wallen. The proceedings throughout the evening were most enthusiastic and enjoyable, and were characteristic of the manner in which all the undertakings of the club are carried out. A considerable portion of the evening was occupied in the distribution of the prizes won during the past season. There was an excellent musical programme.

**LIVERPOOL A.C.C. ANNUAL PRIZE DISTRIBUTION AND SUPPER.**

Members of the committee on the platform. Mr. Roberts is seen handing the 50 Guinea Reliance Cup to the president Mr. Sellers, who in turn hands it over to the winner, Mr. E. F. Baxter. From left to right the members are: Messrs. Barton, Baker, Hobbs, Roberts, Sellers, Baxter, Mogridge (Chairman), Longton, and Phillpott.

Mr. and Mrs. Baxter loaded up with prizes. This photograph is suggestive of "collaring the lot!" All have been won on Rex machines.

## The New Petrol Substitute.

**N**O doubt, by this time, many of our readers have read in the newspapers varied accounts of the new petrol substitute. The steady increase in the price of petrol, coupled with the prospect of a still further increase in price owing to the growing demand for the commodity, is causing scientists and motor cycle manufacturers to turn their attention to the possibility of increasing the supply, or discovering a suitable substitute, in order to reduce the price.

At present, benzole seems to be the most popular competitor, and, as already pointed out, it can be obtained as a by-product of coal. As the chief mining centre of the world, South Wales will probably take the lead in producing the new substitute, and already South Wales colliery owners, alive to the value of the commodity and the rapidly increasing demand for it, are setting up plant at the most important of their collieries. What has yet to be discovered is whether it can be produced at such a cost as satisfactorily to compete with the imported article, and many scientists believe this possible.

It is asserted that, properly treated, South Wales coals, excepting, of course, the steam and the anthracite, will yield from 7% to 35% of their own weight in valuable oils similar in quality to petroleum. Refined oils have been made in Germany for some years, and great importance is attached to the recovery of the spirit in that country.

### Mining Expert's Opinion.

To gain further particulars regarding the new substitute, our Glamorganshire representative interviewed a well-known South Wales mining expert, who said that the cost of producing benzole from South Wales coal seams was such as to make the laying down of plant an exceedingly doubtful speculation.

The amount of benzole recoverable from, say, 100,000 tons of coal would be so small that even with the present high price of petrol the profits accruing to colliery owners would be very small. This would not allow the producer to grant a very material reduction in the price of the spirit. This fact would seem to throw cold water on the whole scheme, but, on the other hand, there will be an increased demand for petrol in the near future, and it naturally follows that there would be improved machinery and plant for the recovery of the spirit, so that with both combined it is more than probable that a modern plant, efficiently managed, would more than justify its production.

On the Continent for years the recovery of by-products has been a considerable factor in connection with a large number of collieries, and in Belgium many collieries would be financial failures if they depended solely upon the profits from the sale of coal. But the expert chemist, has stepped in to assist the mining engineer, with the result that the mines are working advantageously from a financial standpoint.

The recovery of by-products commenced at the Great Western Collieries, Powell Duffryn Collieries, Lewis Merthyr Collieries, and elsewhere is only an augury of future progress in this direction. The excellence of South Wales coals has been in a certain way a cause of loss. The mining engineer, having depended almost entirely upon the market price of his large and medium coal, has frequently "gobbed" the small, which could be utilised to advantage. The oils which are obtained by distilling coal at a low temperature have been completely ignored owing to the fact that a considerable proportion of small valuable coal has been "gobbed."

### A Profitable Use for Small Coal.

However, it is expected that the mine owner will now see the advisability of turning his small coal to greater advantage than hitherto. Of course the idea of utilising this coal extract is as yet in its birth. Nevertheless the fact that mining and engineering students are turning their attention to the study of the subject is taken as a very hopeful sign of eventual success. The Blaenavon Colliery Company have already placed orders for new coking ovens, which are now almost completed. The coking ovens will, of course, form a considerable factor in the production of the spirit. The company have also decided to set up extensive plant for this purpose, and expect to commence operations in the course of a few weeks, and to be recovering refined benzol in the early part of next year. Of course, the success of the scheme is not definitely assured, but the Blaenavon Co. are evidently very sanguine as to the ultimate success of their enterprise, for in their report issued to shareholders they point out that with the coming into operation of the new plant, and with anything like the usual conditions in the coal trade, they expect to realise large profits.

Surely the time is now far enough advanced when an effective petrol substitute should be brought into use, for with petrol controlled by a trust, which is credited with pressing the prices to an extravagant height, there has been a continuous enquiry for a suitable spirit which would serve consumers equally as well as petrol. It is really interesting to notice the shameful manner in which petrol has advanced in price since the end of last year, when it is generally supposed an arrangement took place between those who control our only constant supply. This action placed both dealers and the motoring public completely at the mercy of monopolists.

However, should the new discovery prove as efficient and economic as it is generally believed, then perhaps, after all, the way is open to freedom from the exactions of monopolistic trusts. It is also quite within the bounds of possibility that, should the substitute exhibit any marked success in the early stages of its trials, the present inflated price of petrol will fall.

# THE CHOTA RUNABOUT.

A True Cycle Car with Single-cylinder Engine and Belt Drive.

**N**OT long ago we published a description of the Buckingham engine, manufactured by Buckingham and Manly, of Spon Street, Coventry, and last week we were given an opportunity of examining the complete cycle car to which it is now fitted. We may recall that the engine has a single

Ball bearing rocker and ball head tappet device.

cylinder of 89 x 120 mm. bore and stroke, overhead valves, and a large outside fly-wheel. A Senspray carburetter is fitted.

With the exception of minor improvements, such as a ball-head tappet and a magneto running at engine speed, the

engine remains the same. Two chains transmit the power to clutch drums on the counter-shaft, which is placed well forward in the chassis, and either of

Front axle and springing of the Chota.

these clutches may be engaged by a single operating pedal. Pushed right forward, the low gear clutch is engaged; on being allowed to come backwards, first a free engine position is obtained

and maintained by a trip pedal mounted on the main pedal, then when the trip is released the high gear is engaged. The process is extremely simple, and it is impossible to change gear badly. The clutches are of large diameter, and, instead of sliding on the usual keyed or squared shaft, are held

Rear view, showing the low build and simple construction.

to the shaft by four steel arms of ample strength, on which they slide.

## Belt Transmission.

From the counter-shaft, long belts drive the rear wheels and no differential is employed. The chassis is of channel steel, and all the wheels are mounted on similar spindles so that they can be changed with ease. The front of the frame is mounted on a single transverse spring, the rear being supported by two quarter elliptical springs, which are allowed to slide on plates on the rear axle. Long radius rods are used to maintain the correct belt tension.

Rear springing, belt drive, and brakes on the new Chota.

Both brakes are of the shoe type, acting on the belt rims and placed one above the other.

The machine is particularly noticeable for its simple and stout construction; it is in every way a true cycle car, but considerably stronger than many at present on the road. Thus it should meet the requirements of those who require a light but substantial cycle car.

The engine is extremely flexible and runs very smoothly, its most noticeable feature being that it will stand with comfort a very high gear. With a top gear of approximately  $3\frac{1}{2}$  to 1, we are assured that it will easily go from Coventry to London and back with two up and without changing gear, which speaks well for its power.

The power plant. The single-cylinder engine measures 89 x 120 mm., and has overhead valves.

## The Taxation of Cycle Cars.

FROM the number of enquiries we receive on the above subject it appears that many people do not realise that all four-wheeled cycle cars are taxed as cars, and that the taxation is based on the R.A.C. horse-power formula  $\left(\frac{D^2N}{2.5}\right)$ ; that is to say, on the bore of the cylinder or cylinders only.

Below we give the taxes most likely to affect owners of cycle cars:

Single-cylinder engines up  
to 102 mm. bore ... £2 2 0 tax  
Over 102 mm. and up to  
138 mm. bore ... £3 3 0 tax

With single-cylinder engines, there will not be many who will have to pay more than £2 2s., but in the two-cylinder class all users of 8 h.p. engines will have to pay £3 3s., as will be seen below:

Twin-cylinders up to 72  
mm. bore ... £2 2 0 tax  
Over 72 mm. and up to  
98 mm. bore ... £3 3 0 tax

Four-cylinder engines start at £3 3s., and few cycle cars would exceed this tax, as to keep inside the 1,100 c.c. capacity allowed for cycle cars, the bore would seldom reach 68 mm.

Four-cylinders up to 68 mm. ... £3 3 0  
Over 68 and up to 80 mm. ... £4 4 0

Then there is the registration fee, which is £1, the same as for cars.

As regards three-wheeled runabouts, if the weight be less than 3 cwt. a 5s. registration fee will suffice. The annual tax for three-wheeled machines, no matter how much they weigh, is £1.

We publish this list for the benefit of those who are unaware of the facts, but, although it seems unfair to tax a light cycle car upon the same basis as a big car, those who can afford a cycle car will scarcely be deterred by the extra tax.

Broadside view of the single-cylinder Chota, described on previous page.

## Belt Drive and no Differential.

AN amateur-built runabout which has been driven nearly 10,000 miles this year is the subject of our illustration. The designer, who is seen at the wheel, is Mr. Noel Crane, of Nottingham. In sending us the photographs, he mentions that the machine still has the original tyres (700 x 65 mm. Michelins). This long life the owner largely attributes to the belt drive, which he considers splendid for a light machine, provided it is arranged in a proper manner, which only road experience will prove. Mr. Crane has had no trouble on the road through breakdown; also he finds his vehicle steady to steer at all speeds, whilst in wet weather skidding is almost unknown. One reason for this may be attributed to the fact that the

frame is underslung and the centre of gravity is kept low.

The engine is an 8 h.p. J.A.P. twin, and has splendid pulling qualities, enabling the little car to climb all ordinary hills on top gear. The maximum speed is about 40 m.p.h. The Whittle belts have stood the test splendidly, we are told. The consumption is given as fifty miles to the gallon. The designer does not consider there is the slightest need for a differential; at any rate, he has not suffered from the absence of one on his machine, nor has abnormal tyre wear suggested its desirability.

An 8 h.p. runabout built by a Nottingham reader to his own designs.

# QUESTIONS and REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Oil Leakage.

**C.** I have a 1912  $3\frac{1}{2}$  h.p. two-speed B.S.A. Would you tell me if there is any way to prevent oil being blown out through pulley (crank case release)? After riding about five miles at a moderate speed the side of my boot is bespattered. Drip-feed lubrication is fitted. —J.M.B.

The best way to obviate the trouble is not to lubricate too freely. Another thing you can do is to fit some sort of guard. The same difficulty is experienced with all machines having hollow crankshafts. There should be a sort of baffle or guard in front of the outlet so that the oil is not blown straight out.

## Fixing a Sidecar.

**C.** (1.) Is it absolutely necessary for the wheel of a sidecar to be the same size as that on the motor cycle? (2.) What is the best method of fitting a sidecar? I assisted a friend with one, and we did it by using straight edges on the rim of the sidecar wheel, and on that of the motor cycle back wheel, then measuring the distances between the ends of the two.—T.E.

(1.) It is not necessary, though desirable, for the sidecar wheel to be the same size as that of the motor bicycle. (2.) The method referred to of fixing a sidecar is quite satisfactory.

## Cut-out Regulations.

**C.** On page 1159 of *The Motor Cycle*, I notice in the note on cut-outs that "any apparatus or device which will allow the exhaust gas to escape into the atmosphere without first passing through an expansion chamber" will not be allowed. My Rudge is fitted with Chanticleer exhaust whistle. (1.) Would you be good enough to tell me if I shall have to have this removed? (2.) Could it be fitted the other side the exhaust box—by a law-abiding citizen? (3.) Is this now law or just a proposal.—W.B.V.

(1.) We think you may safely take it that the Local Government Board will not count an exhaust whistle as an offence against the regulation. (2.) Whether the whistle would be efficient on the far side of the exhaust box depends upon the design of the latter. (3.) The regulation referred to comes into force on the 1st March.

## Low Gear Climbing.

**?** (1.) My machine is a  $2\frac{1}{2}$  h.p. Hobart, 1912, three-speed and clutch. After mounting a hill on low gear (which the machine does splendidly), I find at times that the engine will not "pick up" again on the high, or even the second speed. Is this due solely to overheating, as when the engine cools, matters are quite right again? (2.) Although the compression seems fairly good when the engine is running, I can feel a leakage from under the compression tap washer, also the sparking plug. How can I bed the washers better? Both are screwed up as tightly as possible. Do you think it necessary for them to be absolutely air tight or gas tight? (3.) Should oil be drained from the crank case frequently?—S.B.

(1.) The symptoms certainly seem like overheating, which would be due to running continuously on low gear. Use plenty of oil. (2.) You had better fit a new washer to the compression tap and sparking plug, and see that the surfaces of the joints are clean and true. It is necessary for all joints to be absolutely gas tight. (3.) Yes, oil should be drained from the crank case every three hundred

miles, and the crank case well washed out with paraffin after which inject two pumps of oil.

## Maintaining Compression.

**?** (1.) I have a  $2\frac{3}{4}$  h.p. a.o.i.v. and cannot get compression after cleaning deposit of cylinder and fitting new piston rings which fit dead true. Provided that cylinder walls are not worn, what is the most likely cause of loss of compression? (2.) Before disturbing the cylinder compression was perfect. Am I right in concluding that slight eccentric wear in cylinder is met by the same wear in piston rings, and therefore preserving compression? (3.) What is the cause of eccentric wear in cylinder?—M.I.J.

(1.) You do not say how long the machine has been running since you cleaned out the cylinder. Probably after about a couple of hundred miles the compression will return and the machine will run as well as ever. Probably the loss of compression is due to the new rings requiring to be run in, and also to the fact that you have disturbed several joints which had eventually become sealed up with burnt oil. (2.) We think you are correct. (3.) Eccentric wear is caused by the weight and side thrust of the piston.

## ANCIENT AND MODERN.

Our photograph shows a two-speed lightweight Enfield beside the Lanyon Cromlech. There are three or four of these cromlechs in Cornwall, and they are supposed to represent the headstone or monument of a chieftain during the Druidical period.

## Licences.

**Q** I bought a motor cycle last October, and obtained my driving licence and transferred the number, but I did not take the carriage tax licence. What I want to know is, am I forced to take this out for this year, provided I do not ride the machine, which I have not done yet, as I have been altering and repairing it? My neighbours tell me the police have been enquiring about the machine, but they have not asked me about it yet.—W.H.

You are not liable for the local taxation licence—10s., available until December 31st—if you have not used the machine on any occasion at all. Of course, the fact that you have registered the machine and bought a driving licence naturally gave the authorities the information that you were keeping a machine, which, for all they knew, you had been using.

## Electric Lamps.

**Q** Could you recommend a really first-class electric head lamp for  $3\frac{1}{2}$  h.p. 1912 Triumph? I have at present Lucas's best lamp. Would the electric lamp be as powerful? A really good lamp is essential here (Co. Tipperary), as the road is regarded as a good sleeping place for donkeys, etc.! I should want a lamp capable of burning for one month without recharging, but actually burning about twenty-four hours a month.—ELECTRIC LIGHT.

The C.A.V. and Hunt electric lamps are very good, but would not be quite so powerful as a good acetylene lamp. Full particulars can be obtained from Messrs. C. A. Vandervell and Co., Ltd., Warple Way, Acton Vale, W., and A. H. Hunt, 115, Cannon Street, E.C. We should recommend at least a 20 amp. accumulator. It would be advisable to have two.

## Petrol Consumption.

**Q** I have ordered a T.T. roadster James for 1913 with the racing universal model B. and B. carburetter, with variable jet and variable bottom air-shutter. As petrol may reach a prohibitive price next year, I am anxious to get a very economical carburetter. The machine will be run with a 4 to 1 gear (round London mostly). (1.) I am thinking of ordering the new Binks two-lever carburetter in addition to the variable B. and B. Do you consider that the former should give the limit in low consumption, and, if not, what make can you advise? It seems to me that a variable jet type such as the new B. and B., if properly handled, should be fully equal in this respect to a two-jet instrument which has fixed jets. On my 1912 T.T. Bradbury I get 95-100 m.p.g., averaging 28 m.p.h. On the other hand, I know a man with a 600 c.c. single-cylinder Precision motor and 4 to 1 gear who gets 120 m.p.g. and reaches 30 m.p.h. on the pilot jet with the standard touring one-lever Binks. I also should like to get 120 (I have got 120-140 m.p.g. with a 32 jet standard 1910 Triumph carburetter, averaging 22 an hour). What do you recommend? I want to average 25 an hour. Easy starting, of course, is a *sine qua non*. (2) Which is the better for low consumption in your opinion (round London)—a high gear, say  $3\frac{1}{2}$  or 4 to 1, or a lowish one of say  $4\frac{1}{2}$  or  $4\frac{3}{4}$  on the make in question? Different men tell me exactly opposite things, and the B. and B. people recommend a very high gear for the purpose. (Expert driving allowed of course in either case.) Weight of rider, 10 st. 10 lbs.—C.P.

We think you would get very good results from the B. and B. Universal or the Binks two-lever carburetter. Petrol

consumption is mysterious on some motor bicycles. Some machines will run economically and others do not, and if any attempt be made to make them run economically they sometimes lose a great deal in efficiency. Experiments with the two should be interesting, and we should be glad to hear the result. If you are running in London, for low consumption we should say that a  $4\frac{1}{2}$  to 1 gear would be better. If by round London you mean the country roads surrounding London you should gear just as high as it is comfortable to ride the machine.

## EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"R.W.M." (Ashton).—T.T. Rudge and Singer, also Binks carburetter.

"H.W." (Co. Armagh).—Coronet and Farrar's sidecars with  $3\frac{1}{2}$  h.p. machine.

"Codfish" (Cromer).—Morgan runabout, reliability, consumption, and average speeds on long runs.

"V.M.D." (Chester).—Martin-Jap and Multi-Rudge, cost of upkeep, particularly tyres and petrol.

"W.D." (Birmingham).—G.W.K. petrol consumption, speed, hill-climbing, and tyre wear.

"H.R.J." (Kimberley).—Scott, its reliability, chain and gear wear, and petrol consumption?

"G.M." (Greenhithe).—4 h.p. twin Hobart for sidecar work; as regards wear and reliability.

"A.A." (Nelson).—Binks and Senspray carburetters on  $2\frac{1}{2}$  h.p. Enfield or similar lightweight. Also the use of paraffin instead of petrol with Senspray.

"U.W.M." (Dublin).—Any type of variable gear fitted to a model G Douglas.

"G.W." (Dublin).—5 h.p. four-cylinder two-speed F.N.,  $4\frac{1}{2}$  h.p. three-speed Excelsior, and  $3\frac{1}{2}$  h.p. two-speed belt drive Bradbury for sidecar work. Experiences as regards petrol consumption and hill-climbing.

"B.M.V." (Crouch Hill).—Exhaust whistle for 1912 Indian with long exhaust pipe.

"M.B." (Surrey).—Reliability of "Auxiliary motor set" made by City Motor Works, Gloucester.

"A.J." (Rotherham).— $3\frac{1}{2}$  h.p. Bradbury, engine-shaft two-speed gear with sidecar, reliability, hill-climbing, and consumption.

"Lieut. R." (Bouillon).—(1.) 5-6 h.p. F.N. two-speed and  $3\frac{1}{2}$  or 6 h.p. N.S.U. two-speed for use in the Ardennes, occasionally with a light sidecar. (2.) Best non-skid (a) steel-studded tyre or (b) Kempshall.

"C.W.C." (Surbiton).—Cowe speedometer, accuracy of registering.

"P.A.W." (Chatham).—Private owners' experiences with Matchless, Williamson, and Veloce. Binks two-jet carburetter and electric lighting on motor cycles.

"H.W.C." (Brockley).—Levis. Consumption and reliability.

## THE MOTOR CYCLE IN JAPAN.

Motor cycle racing is being taken up with enthusiasm in Japan. A meeting was held on the 10th ult. at the Naruo Race Course. A  $2\frac{1}{2}$  h.p. twin Humber, ridden by Shigesaburo Emi, took part in eight races, winning seven and obtaining second place in the eighth. In addition, the rider secured the Championship of Japan; the speed in this contest was approximately 56 miles per hour.

**A Two-speed Gear.**

This gear is stated in the specification to be applicable as an engine-shaft, counter-shaft, or hub gear, the latter being the one illustrated. The belt pulley carrier A is formed with a gear wheel B engaging planet pinions C, which in turn gear with pinions D mounted on fixed spindles in the hub shell E. The pinions D engage a further pinion F on a sleeve G, which is formed with a carrier or abutment H. This carrier is provided

with projecting drivers engaging two sets of clutch plates J K, the former for clutching to the hub shell and the latter for securing it to a fixed member L, which is anchored to the frame of the machine. Operation of the clutches is effected by means of face cams M provided with an operating lever N. When the clutch plates K are in engagement the carrier H and pinion G are held stationary, and the drive is transmitted through the gear train B C D F. When the clutch plates J are in engagement the drive is direct, the mechanism running solid, and when both clutches J and

**Winter Hill Climb.**

Continental tyres were fitted to L. Mogridge's  $3\frac{1}{2}$  h.p. Mead when he won a gold medal and the "Percy Butler" challenge shield in the Liverpool A.C.C. hill-climb on November 30th.

**Change of Address.**

Lodge Bros. and Co. are moving from 14, New Street, Birmingham, to larger and more convenient premises immediately adjoining their works. On and after the 24th inst. all communications should be sent to Lodge Bros. and Co., Wrentham Street, Birmingham.

**Heavier Tyres for Special Work.**

The Kempshall Tyre Co. inform us that the Triumph Cycle Co. have given their depots instructions to recommend Kempshalls to any rider wishing to order a stronger or heavier tyre than that which they fit as standard pattern. This decision has naturally caused great satisfaction to the makers of the Kempshall.

**Neat Sidecar Fittings.**

The new design of quickly detachable sidecar clips illustrated on page 1474 in our issue of the 5th inst., are manufactured by the Carroll Sidecar Co., Ltd., Conybere Street, Birmingham, which company hold the patent for the clips. It is claimed for them that they are the most rigid and the most easily detached clips on the market.

K are in the neutral position a free engine is provided.—A. E. Hooke, No. 25,535, 1911.

**Wooler's Anti-vibratory Frame.**

The frame itself is on original lines as can be seen from the illustration, and both the front and rear wheels A and B are mounted in spring housings C and D, the former carried by the steering fork and the latter built into the rear stays. Supports or stands E, whereby the machine may be held vertical when stationary, are pivoted to the housing C and D, and are retained in position by internal springs

actuating a detent (not shown). The tank G is of a novel type, being made in two parts, H and J, which can be assembled around the head of the machine and secured together. The shape of the tank and the fact that a large part of it projects forward of the head of the machine enables a tank of large capacity to be used without cramping the space available for the engine, etc.—J. Wooler, No. 26,152, 1911.

**SPARKLETS****Cycle Car Trial Runs.**

Stewart and Arden, Ltd., 18, Woodstock Street, Bond Street, W., have acquired the sole London and district agency for the Morris-Oxford light car. Trial runs can be given the first week in January next.

**Phoenix Sidecars.**

Excellent business in sidecars is reported from the sidecar depot of Phoenix Motors, Ltd., 736, Holloway Road, London, N., where a full range of different types of chassis and bodies is on view in their showrooms.

**A Comfortable Saddle.**

Mr. Gibbon, who recently completed the first A.C.U. official trial with an Alldays motor cycle and sidecar, informs us that he used a Leatheries saddle, and states that during the 1,076 miles covered he never suffered from saddle soreness. The type of saddle used was the Empire de Luxe, made by Messrs. Leatheries, Ltd., Birmingham.

**Sidecar Frame.**

In order to provide a low body position while retaining the usual main axle tube, the frame comprises two longitudinal members AB connected at the rear by

the cranked axle tube C. The cross tubes DE supporting the body are U shaped, affording a low position.—E. Farrer, No. 5,070, 1912

**Rear Wheel Mounting.**

The rear driving wheel A of a tricar is mounted upon an axle B carried by the ends of a pair of laminated springs C. To maintain the wheel A in its correct plane a pair of rods D are provided, and

these rods are connected at their upper ends to cranks E, on a shaft F, free to rotate in bearings on the body G. The springs C are, therefore, free to work in a vertical direction, whilst twisting is prevented.—Alldays and Onions Pneumatic Engineering Co., Ltd., and C. E. Simms, No. 25,189, 1911.

**Liverpool Repair Depot.**

A special department for the repair and overhauling of all makes of motor cycles has been opened by the Mead Cycle Co., 11-13, Paradise Street, Liverpool. H. A. Brayshaw, recently in charge of the motor cycle special competition department of Humber, Ltd., has been engaged to supervise overhauling, repairing, and testing of machines.

**Catalogues Received.**

An excellently arranged and printed catalogue of the 1913 Rover motor cycles is just to hand. It contains among other items an account of the ascent of Snowdon by Mr. Spencer on a  $3\frac{1}{2}$  h.p. three-speed Rover, a list of Rover successes accomplished by private owners and the firm's own trade riders. There are also good illustrations and specifications in detail of the  $3\frac{1}{2}$  h.p. Rover motor bicycle and the new sidecar with brake on sidecar wheel. This catalogue can be obtained from the Rover Co., Ltd., Coventry.

The catalogue of Martin motor cycles, handled by Cars and Motor Sundries, Ltd., 175, Shaftesbury Avenue, W., contains particulars and illustrations of the following:  $3\frac{1}{2}$  h.p. standard roadster, 85 x 85 mm.; 4 h.p. standard T.T., 90 x 77½ mm.; 4½ h.p. Brooklands T.T., with same sized engine; a twin 6 h.p., 76 x 85 mm.; and an 8 h.p. twin. The catalogue also contains a list of Harry Martin's records.

Motor Cycle and Cycle Car Factors,  
**MORECAMBE.**

Telephone: 112. Telegrams: "Hitchen's Ltd., Morecambe."

If retail buyers prefer to purchase a motor cycle or cycle car through their local agents, we are always pleased to quote trade terms to the local agents.

## THIS WET WEATHER

pack gears, bevels, worms, and hubs and other bearings, with Hub Lubricant to keep out water and grit which will otherwise work in with ruinous results.

(See A.C.U. Trials Results.)

**HUB LUBRICANT** is many times more efficient than oil, more easily applied, and it stays in and keeps wet out.

Hub Lubricant is fluid when warm and it can then be injected into gears and bearings with a grease injector, which is like an ordinary syringe on a small scale. It flows in like oil and jellifies on cooling.

**HUB LUBRICANT** and other interesting preparations are fully described in 1913 Lists.

All Literature is sent post free.

**ICES' COMPANY LIMITED**

(PRICE'S PATENT CANDLE COMPANY LIMITED)  
Lubricating Oil Department

**BATTERSEA, LONDON, S.W.**

Hub Lubricant—post free—½lb. tins, 9d.; 1lb. tins, 1/-

All Accessories included on S.H. at the price advertised.

### NEW 1912 MACHINES TO CLEAR—CHEAP.

RUDGE, T.T. Roadster .. £36  
 TRIUMPH, free engine .. £48  
 SINGER, 4 h.p., 3-speed .. £54  
 CLYNO, 5-6 h.p. .. £59

**Sole London Wholesale Agent for Norton, New Imperial, and Corah Motor Cycles, also Canelet Sidecars, and shall be pleased to appoint Agents for same.**

### THE FAMOUS "REY" SIDECARS.

ALL MODELS IN STOCK.

Wicker body, £5 5s. Torpedo, £6 5s.  
 Side-entrance Models, Wicker, £7. Coach-built, £9 10s.  
 2 Elegant Cane Models, Side-entrance, £10 10s.  
 All complete with Hutchinson or Michelin 26 x 2½ in. tube and tyre, and quick detachable joints.

—LIBERAL DISCOUNTS TO THE TRADE.—

# REY

**AND 173, GT. PORTLAND ST., LONDON, W.**

## ALL OUR SIDECARS ARE GUARANTEED 12 MONTHS

MODEL D DE LUXE,  
£6 5s.

MODEL C,  
with Cane Body, £7.

MODEL E,  
with Reversible and  
Detachable Child's Seat,  
£7 5s.

MODEL D,  
with Coach Built Body,  
£8.

## OUR REED CANE BODIES

have undoubtedly hit the mark.

Undoubtedly this class of cane is far superior and more classy than ordinary cane or wickerwork, besides being considerably lighter. These beautiful sidecars appeal to those who want absolutely the best.

### Model G

£7 10s.  
Model F

£8 8s.

All our Sidecars are supplied  
Complete with Lamp, Foot Mat, Kick-up Stand,  
Quick Detachable Joints, Continental or Michelin  
Tyres, Round or Car Pattern Mudguard and  
CARRIAGE PAID. Send for List.

### MISCELLANEOUS BARGAINS.

Cowley Speedometer, done 100, perfect	£3 10
3 1/2 h.p. Rex Engine, like new	£4 0
New Rubber-studded Covers, 26 x 2 1/2, beaded	17/6
Small Tricar Radiator	5/-
Triumph pattern Handlebar, new	6/3
New Prested Accumulators	7/6
New Prested Trembler Coil	15/-
Lycett's "Top Tuke" Toolbags	7/-
New Screw-cutting Lathe, 4in. centres	£6 10

## MOTOR BICYCLES FOR SALE.

QUADRANT Motor Cycle, 3 1/2 h.p., mag., spring forks, Cliecher tyres, stand, carrier, first-class order; bargain, £15/10.-12, Bull Ring, Birmingham. [X5314]

HUMBER Lightweight, 2 h.p., mag., Druid forks, Dunlop tyres, bargain, £15/10.-12, Bull Ring, Birmingham. [X5315]

LADY'S Motor Cycle, 2 1/2 h.p., mag., Druid spring forks, Dunlop tyres, 3 speeds; bargain, £15/10.-12, Bull Ring, Birmingham. [X5316]

SINGER Motor Cycle, 1912, 2 1/2 h.p., Dunlop tyres, spring forks, only little used, very fast; bargain, £26/10.-12, Bull Ring, Birmingham. [X5317]

SCOTT Motor Cycle, 4 h.p., two-cyl., free engine, 2 speeds, Brooks saddle, back rest, King of Road head light; bargain, £28.-Brown's, 12, Bull Ring, Birmingham. [X5320]

PREMIER, 1912 model, 3 1/2 h.p., shop-sealed only, free engine, Bosch water tight mag., spring forks, Dunlop tyres; makers' price £54/17, sell £59/10.-Brown's, 12, Bull Ring, Birmingham. [X5321]

ROYAL Enfield, brand new, 1912, 2 1/2 h.p. twin, free engine, 2 speeds, Dunlop tyres, chain drive; makers' price £52/10, bargain, £39/10.-Brown's, 12, Bull Ring, Birmingham. [X5322]

1911 Rex De Luxe, 3 1/2 h.p., free engine, 2 speeds, Bosch, Druids, B. and B., splendid condition; £30: take good push cycle part payment.-R. Crump, 120, Dalton Sq., Butts, Coventry. [X5288]

MOTOSACOCHE, 1911 (Dec.), 2 1/2 h.p., free engine, mag., Whittle, in perfect running order, plating, enamel, tyres very good, overhauled makers August £25.-Nichols, solicitor, Peterborough. [909]

1913 Triumphs, Matchless, Douglas, Hazlewood, New Hudson, Enfields, Rudge, Zeniths, Bradburys: get our prices before ordering; deliveries December; also cycle cars.-Clifford's Motories, Eastwood. [886]

2 1/2 h.p. Singer, new last August, fast, reliable, won silver medal in French trial, just being overhauled by makers; what offers? owner buying sidecar machine.-Bollack, 54, St. Patrick Rd., Coventry. [X509]

ROVER, June, 1912, 3 1/2 h.p., Sturmer-Archer 3-speed gear, only done 1,500 miles, owner leaving the district; what offers? appointment may be arranged.-Address, Box L339, The Motor Cycle Offices, 20, Tudor St., E.C. [0189]

1912 Model 2 1/2 h.p. Twin Humber (new at Whitson), Edler, Armstrongs 3-speed gear, 2 1/2 h.p. rear tyre, double footrests, belt guard, spare belt, lamp, horn, and spares, excellent condition; near offer to £31.-Geoffrey Smith, Dunelm, Northumberland Rd., Coventry. [0142]

BARGAIN.-Triumph, 1907 model, with 1911 cylinder and piston, 1912 improvements, new belt, Dunlop tyres, Triumph lamp and generator, Jones speedometer, T.T. and touring handlebars, spares and tools, in splendid running order; take £27/10, or near offer.-Box N/1, 1,435, The Motor Cycle Offices, Coventry. [0167]

PLASTOW, Grimsby, has for sale a 1912 Douglas Model G, brand new, £36; 1911 Douglas, Model K, £32/10; 1911 F.E. Triumph, £36; 1912 F.E. Triumph, £42; 1910 F.E. Triumph, £32; 1911 Premier lightweight, £21; 1910 twin Enfield, £18/10; 1911 Indian, 7 h.p., including new spare tyre, £42. [X5248]

BARGAINS in new machines.-I have managed to purchase a limited quantity of first-class shop-sealed, but otherwise new, machines at ridiculous prices. Now is your chance to secure one at equally astonishing prices. If you wait until the spring you will be unable to buy on anything like such terms. Do it now. Particulars of machines, new machines, cheap, absolute bargains. Blumfield, 4 h.p., Simms mag., B. and B. carburettor, Armstrong 3-speed, Dunlop tyres, price £40/10. Ilston-Smith, 2 1/2 h.p., Bosch mag., B. and B. carburettor, B.H.K. free engine clutch, Dunlop tyres, price £30/10. J.A.P., 4 h.p., Bosch mag., B. and B. carburettor, B.H.K. free engine, Dunlop tyres, price £35/10. J.A.P., 4 h.p., Bosch mag., B. and B. carburettor, fixed gear, Hotchkiss tyres, £32/10; also a few Bosch magnetos, price £3/10; and B. and B. carburettors, price 18/6. Write for any further particulars which you may require, or make an appointment.-D. Ashmore, 1, Newhall St., office 62, Birmingham. [0207]

### SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon and Bedford.

1913 3-speed Triumph, ditto Bradbury, and free engine Triumph, just in.-Triumph Agent, King's Lynn. [X5301]

DOUGLAS, 1913 model R, 2-speed, kick start: in stock, immediate delivery; £52.-Robinson's, Green St., Cambridge. [0239]

DOUGLAS, 1913, model P, T.T. model; immediate delivery; £48.-Sole Douglas agents, Robinson's, Green St., Cambridge. [0241]

TRIUMPH, 1911, free engine, new Kempshall back, engine and bearings first-class; £38.-Robinson's, Green St., Cambridge. [0242]

DOUGLAS, 1911, 2-speed, racing model, tyres and engine first-class; £36.-Robinson's, Green St., Cambridge. [0243]

1913 Clyno, 5-6 h.p., 3-speed gear, detachable wheels; £75; January delivery.-Sole district agents, Robinson's, Green St., Cambridge. [0244]

EARLY Deliveries of Triumphs, Matchless, Douglas, Enfields, Bradburys, B.S.A.'s, HUMBERS, PREMIERS, RUDGES, Humberettes.-Lambert, Thetford. [X5002]

## "IXION" says:-

"The MORGAN Chassis, weighing 2 1/2 cwt., with an 8 h.p. engine, has few rivals either in lightness, price, or general efficiency."

WE CAN GIVE EARLY DELIVERIES

Price 85 guineas.

EXCHANGES QUOTED.

## 1913 A. J. S., New Hudsons, Swift Cycle Cars

EXCHANGES QUOTED.

### THIS WEEK'S BARGAINS.

Brand new 1912 2-speed B.S.A.	£18
1912 3 1/2 h.p. NEW HUDSON, 3 speeds	£45
1912 3 1/2 h.p. RUDGE MULTI	£45
1912 3 1/2 h.p. REX, vertical, M.O.V., good	£14
3 1/2 h.p. PREMIER, 2 speeds, new	£46
1 1/2 h.p. N.S.U., 2 speeds, Bosch, Druids	£24
1912 6 h.p. REX DE LUXE, 2 speeds, chain drive	£45
1910 5-6 h.p. REX DE LUXE, 2 speeds, M.O.V.	£30
1912 3 1/2 h.p. NEW HUDSON, 4 speeds, new	£46
1913 3 1/2 h.p. PREMIER, 3 speeds, new	£46
1910 SCOTT, a beauty	£32
4 h.p. 1911 QUADRANT, Roc 2 speeds	£15
3 1/2 h.p. WOLF, magneto	£32
1911 Lady's HOBART, Armstrong 3-speed	£32
3 h.p. TRIUMPH, vertical, M.O.V., good	£15
3 1/2 h.p. 1907 TRIUMPH, extra good	£25
3 1/2 h.p. 1910 TRIUMPH, very fine	£30
3 1/2 h.p. 1910 TRIUMPH, clutch model	£35

### SINGLE-CYLINDER REXES.

3 1/2 h.p. 1908 Tourist, 1909 engine	£23
3 1/2 h.p. 1909 Speed King, extra fine	£23
3 h.p. 1908 Featherweight Rex, Bosch mag.	£17
3 1/2 h.p. 1910, fine gear	£25

### TWIN-CYLINDER REXES.

1906 5-6 h.p. Twin Rex	£20
5-6 h.p. Bosch, Lloyd's variable gear	£22
5-6 h.p. De Luxe, 1908, 2-speed model	£25
1910 5-6 h.p. Rex de Luxe, 2-speed	£30

### SIDECAR COMBINATIONS.

Brand new 3 1/2 h.p. 2-speed PREMIER, and new 10 guineas sidecar	£55
5-6 h.p. 2-speed REX and sidecar	£30
1910 5-6 h.p. REX, 2-speed and sidecar	£35

## £5 DOWN SECURES ANY OF THESE.

BALANCE 30/- MONTH.	
3 1/2 h.p. REX, M.O.V., spring forks	£14
3 h.p. 1908 REX, Bosch magneto	£17
5 h.p. Twin REX, spring forks, h-b. control	£16 10
WOLF Lightweight, magneto, 26in. wheels	£15
1 1/2 h.p. WOLF Tricar, 2 speeds	£19
Discount for Cash down.	

## MOTOR CYCLE FRAMES

We have a quantity of frames by well-known maker. Two styles to choose from.

PRICE 32/6 EACH.

Rigid forks, 7/6 extra. Druid forks, 45/- extra. Enamelled and plated in first-class style.

### MISCELLANEOUS BARGAINS.

Cycle Car Clutch, leather to metal	12/6
Loop Frame, with forks	15/-
Cowley Speedometer, done 5,000	£3 0
New Lycett's Saddle, large size	9/6
F.R.S. Headlight, new	25/-
1912 B. and B. Carburettors, vary jets	27/-
1912 Sausage Carburettors	28/6
Sidecar Aprons, green or red, with studs	7/6
Mills-Velford Sidecar, good	£4 0
One ditto additional room for child	£4 4
Pair 3 1/2 h.p. Druid Forks	30/-

### Cut-outs on Motor Cycles.

**C**ORRESPONDENCE and queries published in the last two or three issues have led us to think that many motor cyclists are becoming unduly nervous regarding the Local Government Board regulation concerning the use of cut-outs on motor cycles. Some readers appear to imagine that they will be called on to discard their present silencers, others think a long exhaust pipe, in addition to a silencer or expansion chamber, will be compulsory, and very few apparently have read the wording of the order in such manner as to interpret it correctly. With a view to clearing the air on the subject we repeat the wording of the order, which is as follows :

"(7.) he shall not use any cut-out, fitting, or other apparatus or device, which will allow the exhaust gases from the engine of the motor car to escape into the atmosphere without first passing through a silencer, expansion chamber, or other contrivance, suitable and sufficient for reducing as far as may reasonably be practicable the noise which would otherwise be caused by the escape of the said gases."

The fact that the order distinctly states that the exhaust gas must first pass through a silencer or expansion chamber should be sufficient to satisfy anyone that he will not have to discard an existing silencer provided it is suitable and sufficient.

There are many motor cycles in use with an arrangement fitted to the end of the silencer by which the engine can be made more silent by closing some of the holes in the expansion chamber, but if these holes were left open permanently it could not be very well argued that the Order was being disobeyed, because the gas in this case would first pass through the silencer. Provided no undue amount of noise were made with this arrangement in use, we do not see how it would be possible to proceed against the rider for using a cut-out.

Motor cycles fitted with a long exhaust pipe and no expansion chamber will be an infringement of the Order, and machines so designed will have to be altered. The Order prohibits the use of such an apparatus, because it allows the exhaust gas to escape into the atmosphere without passing through an expansion chamber, which must be obviously larger in cross area than the exhaust pipe. An exhaust pipe flattened at the end with or without a cut-out at any point in its length will be contrary to the regulation.

The Local Government Board Order is doubtless the first step in legislation towards a reduction in the noise made by motor cycles, and motor cyclists would be well advised to accept the intimation as one which may become more drastic if not taken notice of. There are many very noisy motor cycles in use, and some riders do not make the slightest attempt to reduce noise; on the contrary, by riding on the public roads machines fitted with engines which have been obviously designed for racing purposes, they draw the attention of the Legislature, which is apt to think that, because a minority of riders are careless in this direction, the majority are also offenders.

Once again we would point out that the Order, which will become law on March 1st, is unnecessary, because the authorities have now, and have always had, their remedy, viz., they could summon under common law any rider of a motor cycle or car whose engine, by reason of its noise, became a nuisance.

### Running Costs.

**W**E are again being queried regarding the running costs of motor cycles, sidecars, and cycle cars, and there is little doubt that prospective purchasers have been misinformed on this subject by articles in the daily press. Very incorrect statements have been published respecting the running costs of cycle cars. We noticed one daily paper stated recently that cycle cars, meaning four-wheelers up to 7 cwt. and two passengers, could be run for a fraction over a penny per mile. We trust our readers will not be misled by such absurdities as this. It costs, on our own readers' statistics, many of which were published early this year, about a penny per mile to run a 3½ h.p. motor bicycle solo. The average sidecar combination costs for the same distance about 1½d. per mile; how, therefore, is it possible to run a machine of double the weight, and in most cases of greater horse-power at the same cost? Articles in the daily press regarding such matters may be read with the same credulity as statements respecting the motor bicycle in 1905-6. According to the daily press, at that time the motor cycle trade was a dead or dying industry, and not likely to be resuscitated.

We only wish it were possible to reduce running costs to the low margin indicated by the contributors to some of the daily papers, but unfortunately, from our own experiences extending over many hundreds of miles, we know it is not so at the present time.

# THE MOTOR CYCLIST

# AND THE TRAMP.

ONE of the keenest and smartest motor cyclists in the North of England (the fact that he is as modest as he is good at winning prizes necessitates him remaining anonymous) is known to his intimates as "The Tramp's Pal," a title which is understandable when the number of "lifts" he has given to the occasional rather than the habitual frequenter of the road is taken into account.

Until promotion found him a permanent home, this motorist had to make frequent business journeys between London and Manchester. Unless the weather was very bad, the trips were made on his motor cycle, and as he generally had a sidecar attached the idea occurred to him one day to seek original company. From the day the thought was put into execution until the time arrived for the discontinuance of the journeys, the cyclist never afterwards found a ride monotonous, and it can pretty safely be assumed that those he picked up do not belong to that section who regard motorists in general as selfish.

## The Passengers.

The company he sought was not of his own class, nor was it of the recognised "gentleman of the road" genus. So far as possible, those who were invited to occupy his sidecar seat were irregular tramps, men who were really looking for work and whose means prevented them travelling by any other method than that of the oldest and slowest, namely, "Shanks's Pony." At first he found it difficult to differentiate, but after awhile he became wise. One thing the traveller quickly learnt is that the genuine victim of hard times was reluctant to tell his story. He was willing to reveal it if he found a sympathetic listener, but he did not parade his misfortunes like the "regular."

## Gratitude.

In the majority of cases the motorist never heard anything more of the men he picked up, and a word of thanks at the end of the "lift" ended the casual acquaintanceship. But there were occasions when the thanks took a much more practical shape. One wet night he was driving his machine through a village just outside London when he caught sight of an unhappy-looking individual tramping along through the rain. A query showed that this man had just set out to walk to Liverpool, where he knew he could get work. His was a perfectly genuine case of hard luck. On the long journey he explained that he had been employed as a groom in a big London house, but the advent of motors had thrown him out of a job, and his little savings had disappeared before he could find fresh employment.

The rain was so heavy and the night so dark that the motorist decided to put up for a few hours, and, giving the groom a shilling or two to find himself a bed and some food, he put the machine away in a very muddy state and himself retired. In the morning he found the man waiting for him, standing by the sidecar, which was dazzling in its spick and span appearance. Instead of going to bed the groom had invested a part of the money he had been given in candles and metal polish and had spent the hours in polishing the vehicle until it looked like new. It was all he could do to show his gratitude.

Other instances of a somewhat similar nature come to mind. Once a man of over seventy was helped. He had had a hard fight with fate in London, and had eventually to give up the contest. His son owned a little home in the country, and the old man had been asked to come down and spend the evening of his days with him. The son, apparently, had not thought his dad was not even able to raise the train fare, and the old man was quite concerned about having to confess that he had been forced to walk. The home he was making for was a few miles off the motorist's track, but he dropped the father at the son's door, and was well repaid by the gratitude of both men, the younger one quickly appreciating the position.

## Jack Ashore.

Then there was a sailor who had missed his boat at Liverpool. The vessel had gone round to Bristol to load, and the sailor, without the means to take him, found himself faced with the probability of losing a situation he had held for many years. So he had set off to walk, but his pace would have been quite inadequate to take him to his destination in time. A "lift" of some sixty or seventy miles, however, made all the difference, and "Jack" was put down again with every certainty of catching his boat and keeping his job.

As has been indicated, "regulars" were picked up sometimes, but only once was the "passenger" carried after the discovery was made. Then he was such an entertaining character that the driver could not find the heart to drop him. He kept up a running commentary on the machine and the passers-by which was genuinely funny, and eventually he called "stop" outside a large building in a town through which they were running. This, he explained, was his country home—he preferred it to his other "seats" because they did not insist on washing him directly he got inside.

Sidecar drivers with a seat to spare may easily obtain entertaining company in this way. B.P.

### Transmissions.

Several correspondents have written to criticise my suggestion that an enclosed shaft might be tried as the primary item of a two-step drive. I would remind them that I have only asked for experiments to be made—I did not pretend to guarantee their success; so I noted with interest the combined shaft and chain drive of the Diamond lightweight at Olympia.

The main defect of the primary-shaft is the difficulty of avoiding two right-angled gears (worm or bevel), running at high speed, and subjected to all the shocks of the engine; for, though a small engine can easily be set with shaft longitudinal, it is no easy matter to set a  $3\frac{1}{2}$  h.p. single in this position.

Perhaps smallish *monobloc* vertical twins would come into vogue if the shaft drive were largely adopted. The main advantages of the shaft are its neatness when enclosed, and its freedom from constant and irritating adjustments. However, there is room for experiment, and I doubt whether any of the existing transmissions can be regarded as ideal.

Motor cycling stands to-day just about where pedal cycling stood when Society dames spent £25 on a roadster, and ambled gently about the London parks at fashionable hours, *i.e.*, it is a pursuit appealing to a section of the community, largely as a recreation or a hobby. Its big day is coming, for it is rapidly passing into a general means of locomotion.

When it is fully established as the best method of making necessary journeys, there will be a much fiercer demand for a no-trouble transmission than we have heard yet; and such a transmission is bound to come. The single belt can never fill this bill. Uncased, it gets filthy, and needs adjustment; wholly encased, the huge case would be hideous. The choice will, therefore, lie between wholly encased rigid drives, or a rigid-cum-belt drive, with the rigid item encased.

Against the encased chain we must set the disappearance of chain drive from car design, the unpopularity of gear cases on push bicycles, and the ugliness of the big chain cases staged at Olympia. We must note, however, that the possibilities of chain drive have not been exhausted; nobody has marketed a wide silent chain running over sprockets of small diameter, inside a cast aluminium extension of the crank case, which should also house the gear box; this would maintain alignment, and permit of ready adjustment.

The bulky and cumbrous appearance inherent in these designs makes the notion of a slender encased shaft very attractive, and the newest steels are so excellent that the weight formerly associated with such drives may soon cease to be necessary.

Last week I was contrasting the first speed gear wheel off a 1901 Panhard car with the parallel "B.N.D." steel wheel from a 1912 Grand Prix racer; if metallurgy advances at its present rate, we may eventually see motor cycles driven by shafts little thicker than a modern speedometer transmission.

### Mounting of Gear Boxes.

Among the items which attracted my attention at the Show none was more pronounced than the mounting of counter-shaft gear boxes. I should guess that insecure mountings are responsible for some of the complaints one hears about chains requiring very frequent adjustment.

When a gear box is subjected to a fierce cross strain (owing to the drive entering at one side and leaving at the other), a light steel plate, gripped by a couple of nuts, is scarcely sufficient anchorage, and increased attention will certainly be given to this point in the next twelve months.

At the moment I certainly consider that the lug and eccentric mounting is preferable, though this may often require a pair of extra stay tubes when there is a cross strain introduced.

### Handle-bar Magneto Controls.

Bowden Wire, Ltd., inform me that in their testings they have never had the telescopic tube of a magneto control jam, and that such apparent defects have always been due to the timing lever ring being so tight a fit on the magneto that the entrance of grit makes it stick.

Doubtless this is often the case. I am not aware who are the actual manufacturers of the two magneto controls I used for the best part of my mileage during 1911 and 1912, but I know that they were apt to jam, and that the injection of oil into the sliding barrel portion usually freed the control.

I met a very profane individual this summer—a novice, of course—who had actually retired in an important trial solely for this reason. His machine suddenly ceased to develop any real power, and he could not climb the hills. After wasting twenty-four hours in taking his engine to pieces, he found that his ignition control had jammed after a temporary retard, and that he was permanently running on fully retarded ignition. A spot of oil and a blow from a spanner restored full power in ten seconds!

"The Niagara Motor Bob," an American boy's motor, made at Niagara Falls. It has a 3 h.p. air-cooled four-cycle engine and the transmission is by belt throughout. The wheels are 22in. with wood spokes and solid rubber tyres. The line of demarcation between motor cars and cycle cars is difficult to draw. Should this vehicle be classed as a cycle car or a motor car?

## The Marshall-Arter.

**T**HIS cycle car is the production of a long-established engineering firm, Messrs. Marshall, Arter and Co., Beaver Lane, Hammersmith, W. The engine is an 8 h.p. J.A.P. with crankshaft set longitudinally and water-cooled by thermo-syphon system, each cylinder having a separate delivery pipe to the radiator.

The radiator is of the multi-tubular type, and is so efficient that up to the present a fan has not been needed. Our illustration shows the engine arrangement, the J.A.P. automatic carburetter, and the water-proof Bosch magneto, which is chain-driven. The oil tank is also visible; this contains five pints, and from it the lubricant is fed to the engine by crank case suction through a J.A.P. sight-feed lubricator.

The simple form of carburetter control by means of an accelerator pedal acting directly on a lever connected to the throttle spindle by means of a ball-jointed rod can also be seen. The cone clutch is of the leather to metal type with springs underneath the leather; the clutch is not only effective but very sweet

in action. A spring drive is provided by connecting the clutch and propeller-shafts by a bar of spring steel 30in. long,  $1\frac{1}{2}$ in. deep by  $\frac{1}{4}$ in. thick. This runs in a tube with pieces of wood each side situated midway therein to ensure a central position being maintained. The tube is provided with spherical ends, which allow of just sufficient movement to prevent binding. The final drive is by an enclosed propeller-shaft, the forward end of which is provided with a universal joint and runs in ball bearings. The back axle is excellently designed, and incorporates a two-speed and reverse gear box.

The change speed gear, its counter-shaft, the differential, and the bevel gear transmission are all contained in a box surrounding and forming part of the back axle. The low gear change is effected by sliding the gear wheels; the top gear is engaged by means of positive dog clutches. One illustration shows the cover removed, exposing the gears and differential.

The ends of the rear axle casing are steel castings. Both foot and hand brakes are of the internal expanding type acting on the rear wheel drums and situated side by side. The frame is of ash strengthened by fitch plates and by two steel transverse members, one of which acts as an anchorage for the forward ends of the back springs, while both serve to support the running boards. The chassis is suspended fore and aft on quarter elliptical springs.

The change speed lever engages the low gear when pushed forward and the top gear when pulled back. No quadrant nor gate is provided, the gears being kept in engagement by means of spring bolts acting on the striking rod inside the gear box. The reverse is put into action by means of a separate lever. The front axle is tubular, and the steering is by quadrant and bevel. Wire wheels with straight headed spokes are fitted.

The body is of ample width, and can be fitted with a dickey seat behind if required. On the whole, the Marshall-Arter cycle car impressed us most favourably; the body design is pleasing, and throughout the vehicle is built on sensible lines.

Mr. Ernest Arter took us for an extended drive in the London district, which included some rough roads

V-type water-cooled engine of the Marshall-Arter.

The Marshall-Arter two-speed gear box and back axle unit.

## NEW 500 c.c. TWIN HORIZONTAL ENGINE.

THE firm responsible for the cylinders and parts fitted to the Douglas motor bicycle referred to in the article describing S. L. Bailey's new records (the All British Engine Co.) are putting on the market shortly a new high speed lightweight motor cycle engine. This is of the two-cylinder horizontally opposed type cylinders 68 mm. bore  $\times$  68 mm. stroke = 494 c.c., and thus it will be within the 500 c.c. class. The design of the cylinders, pistons, connecting rods, valves, etc., is similar to that used on the A.B.C. aero engine, and also on the record breaking Douglas, the overhead valves being  $1\frac{1}{2}$  in. diameter. Three connecting rods and a three-throw crank are used, one connecting rod to the centre crank pin going to one cylinder, and the side connecting rods on the other crank pins going to the other cylinder. An out-

side flywheel is used. The arrangement of the connecting rods and the centre lining of the engine is such that absolute balance is claimed, and it is for this reason that the extremely high speed is obtainable. The engine is designed to give its maximum power at 4,000 r.p.m. The cylinders are slightly offset from the crankshaft. The engine has only four bearings, two for the crankshaft and two for the camshaft, and splash lubrication is employed. The standard pistons weigh only nine ounces. The engine will be about 50% lighter than the usual motor cycle engine of the 500 c.c. capacity, and has been so arranged that it will be possible to fit it to most frames without much alteration. Special high grade steels are very largely used in its construction. A slightly larger engine for cycle car work is also to be introduced later.

## ACCESSIBILITY.

Now that the reliability of motor cycles is firmly established, and the general design of the machines is settling down more or less into well-established lines, it would be well if manufacturers would give more attention to accessibility. Of course, the first task was to make the machines as reliable as possible, so that it might be unnecessary to take an engine down except on rare occasions, but in spite of the Cycleclean process for getting rid of carbon deposit and other labour-saving devices it is still desirable to be able to remove the cylinders occasionally, and in the case of many engines (small twins especially) this is a longish job on account of inaccessibility of the nuts and other fittings. It is often impossible to get at these with anything but a punch and hammer, which is a rough and ready method, and the position of the exhaust lifter sometimes makes it more difficult still. I have mentioned small twin engines as being most to blame, but it is only fair to mention that after a tour of Olympia it was upon a small twin that this subject seemed to have been most carefully considered, for both cylinders could be removed from the new 3 h.p. Enfield when three nuts had been taken off.

The detachable wheels adopted on the Clyno and Lea-Francis are a very great advance, for they enable the wheels to be taken out in a few seconds for tyre changing purposes, thus making butt-ended tubes quite unnecessary, and that without disturbing the brakes, transmission, or the hub bearings. Contrast

this with the old method of removing first the belt or chain, then the brake mechanism, and lastly (on some machines) having to take off a mudguard stay before the wheel could be got out between the mudguard and the stand.

AURIGA.

## THE SIDECAR IN THE POSTAL SERVICE.

A  $3\frac{1}{2}$  h.p. Rudge Multi recently adopted for the delivery and collection of letters by the Coventry Post Office, in the district of 'arley. Motor cycles have been used by the Coventry Postal authorities for over a year, and the experiment has proved a great success. The service may be considerably extended at any time.

# THE CHRISTMAS

AS THEY USUALLY ARE,

*It is not the best  
time of year  
for seeing  
the Country*

*With a little  
forethought it is  
perfectly easy  
to keep dry  
& warm*

*Of course it is not  
always wet overhead.*

*Give us a  
cigarette, old man.  
Certainly if you  
tell me the time.*

*One of  
the riders. The same,  
ready to start.*

*The roads  
are a bit  
treacherous.*

*Lighting up time.*

*Appearances are often deceitful?*

# MOTOR CYCLE TRIALS.

—AND AS THEY MIGHT BE.

Sorry Sir I thought  
it was only a cap  
It's alright, I'm on  
a motor bike ..

Stick to it old chap, we're not  
doing so bad, considerin'

An unintentional  
embrace.

An idea  
to make  
the hills  
a real  
pleasure.

We've lost our way  
old man, but we've found  
the Pole.

Why  
one rider  
was  
late.

I wish I'd  
brought my  
sweat/plotter

Don't you worry Sir,  
me and my mate here  
will get you out  
in a few hours, bicycle an' all.

Respectfully

## New Records with Steel Cylinders.

Kilometre and Mile Class B Records Broken. Over 72 m.p.h. on a 2½ h.p.

SOME few days ago, by the courtesy of Mr. Granville E. Bradshaw, of the All British (Engine) Co., Weybridge, Surrey, we examined the Douglas motor bicycle with A.B.C. steel cylinders with which S. L. Bailey afterwards broke the kilometre and mile Class B records (350 c.c.) on the 17th inst.

By way of preface, it should be remarked that the All British (Engine) Co. are very well known for their aeroplane engines, which are remarkable for their exceptionally clever design and the skilful use of materials of the very highest grade, points which in connection with aeroplane engine work are of paramount importance, since the aeroplane engine is called upon to perform a duty vastly heavier than in almost any other branch of petrol engine work. The success of this engine may be gathered from the fact that it is the present holder of the duration flying-record, having remained in the air for 8½ hours.

The All British (Engine) Co. are at the present time experimenting with an entirely new type of aeroplane engine. This is extremely light for its power, by reason of the fact that its normal speed of revolutions is 4,200, the bore and stroke being a trifle more than those of the 350 c.c. motor cycle engine.

### Details of the Record-breaking Douglas.

At Bailey's request, Mr. Bradshaw designed and made the cylinders, valves, pistons, and connecting rods of an exactly similar type to those to be used in the new aeroplane engine, and it was with these that the Douglas motor bicycle was fitted, experimentally, when the above records were broken.

The cylinders are of steel, the bore and stroke being 60.9 × 60 mm. = 350 c.c. The valves are placed in the cylinder heads, and are operated by tappet rods and rocker arms, the tappet rods being arranged to fit the standard Douglas timing gear box. A cast iron piston with one ring is used, and a steel connecting rod. The big and small end bearings are placed centrally on the connecting rod so that there is no overhang, and the cylinders are not therefore set out of centre, but they are offset from the crankshaft.

At the time when we first saw this engine it had just been erected and taken out on the track with its cylinders "in a bag," so to speak, and an attempt was made on the record. This, however, was frustrated by a plug misfiring just before the finish, but an astonishingly high speed was attained. The compression used at this time was not far short of 100 lbs. per square inch, and as this was thought to be too high, plates were fitted between the cylinders and crank case so that it was reduced to 80 lbs. per square inch. It was just after this alteration had been made that we saw the machine again, and were present during its trials on the stand.

After a little trouble with the magneto, the engine started and ran up to a terrific speed. Of separate explosions one could hear nothing at all, the noise of the engine being merely a continuous note, and, in fact, one could only tell alterations in speed by the alteration in the pitch of the note.

The only tachometer that was handy registered up to 4,000 r.p.m., and this was put on to the engine-

shaft, but, of course, it was found that it would not register high enough. During the next attempt we tried it on the counter-shaft, which was running at approximately two-thirds the engine speed. The tachometer needle went up to its 4,000 stop and stayed there, so that the engine must have been turning round at something like 6,000 r.p.m. Its maximum speed has since been found to be 6,500. It develops about 13 h.p., and the power curve rises evenly up to the 5,000 r.p.m. point.

A successful attempt was made on the records on the 17th inst. at Brooklands, Messrs. A. V. Ebbelwhite and A. G. Reynolds timing.

### Details of Records.

Flying kilo. ...	...	...	30.8s. = 72.63 m.p.h.
" mile ...	...	...	51.4s. = 70.04 "

### PREVIOUS BEST.

Flying kilo. ...	32.76s. = 68.23,	Martin (Martin-Jap, 85½ × 60)
" mile ...	53.03s. = 67.85,	" "

In the mile test Bailey would certainly have equalled, and might even have bettered, his kilometre speed with better luck. On the occasion of his first attempt, when his speed was 70.04 m.p.h., he took insufficient start to really get his engine turning over, with the result that the maximum speed was only attained in the last quarter-mile. On his second attempt the speed fell to 67.67 m.p.h., owing to the screws holding the carburettor coming loose and so causing the engine to misfire. He was about 300 yards from the finish at the time, and from appearances, judging by the continuous hum of his engine, Bailey was travelling even better than on his kilometre trial. In the third and last attempt a plug blew to pieces near the finish.

The actual speed has been estimated at 76 miles per hour. This might have been realised in another attempt, but the porcelain particles in the cylinder had to be cleared away.

The Douglas, with steel cylinders and overhead valves, ridden by S. L. Bailey.

# Driving to Save a Life.

**"H**OW comfortable I feel! How thoroughly tired! To-day I have covered a hundred and forty miles on my motor bike, over dry, frozen roads. It has been a fine ride, but not without incident. That carburetter fire! I can't make it out. Now, let me think: whatever could have caused it? Too much air? Blow back? Something wrong with the inlet valve? Or—oh, bother! I'm too tired now; I'll puzzle it out to-morrow!"

Such were my thoughts as I lay in bed. I had come to spend the week-end with my old friend Brett and his wife. Brett is a doctor with a good practice, and lives at the little village of Dippingdon. He has quite a nice house and seems to have a good time. I had arrived cold and hungry, and, after dinner, when we had settled down before a blazing fire in the drawing-room, I had actually almost fallen asleep. I simply could not help it.

## Motor Cycling as a Cure for Insomnia.

Of course I apologised, and Brett kindly laughed it off, saying he would have to prescribe motor cycling for insomnia, in future. Later on I had livened up, the sleepiness having passed off, and we had eventually retired to bed quite late.

\* \* \* \* \*

Almost asleep, I was yet puzzling my head about that carburetter fire. It had ignited while I was descending a hill with the exhaust valve lifted. I had felt a strange warmth arising, then a smell of scorching rubber—my overalls—and then, glancing downwards, I had caught sight of the carburetter ablaze! Pulling up sharp, and turning off the petrol tap, I had let the petrol burn itself out of the carburetter, and, by leaning the machine over, had prevented the flames from playing very much on the tank. And so no real damage had been done. In fact, the machine ran as well as ever immediately afterwards.

But that smell of burning still haunted me. I lived through the incident again and again in my thoughts, and cudgelled my brain for an explanation of the accident.

Carburetter must have been flooding—hot exhaust pipe—no, couldn't be that, exhaust pipe right away from carburetter—inlet valve stuck, ignited back along the pipe—no, inlet valve mechanical, couldn't stick—must have been a stray spark set alight—alight to—ali' to—carbret—carb—oblivion!

\* \* \* \* \*

That smell of burning!

It filled my dreams! Dreams of the ride, down hill, round corners, up hill, past cottages and signposts, a road to the left, a long descent, strange heat, smell of burning, flames!

## I Awoke with a Start!

"Confound that carburetter! I shall always feel uneasy whenever I ride the machine again. I can't get the incident off my mind. Suppose I've ridden a bit too far and am over-tired."

And so to sleep again, and to dream the same thing over once more.

That smell of burning!

I was sitting up in bed!

A burning, smouldering odour!

"It is —, it is a real smell! Not my fancy. Something is burning!"

My heart stopped momentarily! Was the house on fire?

Useless question! Get up and see.

Plucking up courage I hastily donned a jacket, and, opening the bedroom door, peeped into the passage.

Burning!

"Yes, something is alight! The odour is quite distinct!"

"Hark! Is that the snap and crackle of burning wood?"

**Driving to Save a Life.—**

Should I awaken the sleepers? Raise the alarm? Shout "Fire! Fire!" at the top of my voice?

No, fool! Trace the smell. Find out where it's coming from.

Hark! Is that the snap and crackle of burning wood? Can't say. My imagination probably. How dark it is! Get a candle. Go downstairs.

"Downstairs in the hall the dreadful smell was stronger. I grasped the handle of the drawing-room door, and gasped with pain!

**Goodness! It's Hot!**

I snatched my hand away. I saw smoke coming from under the door, and the varnish on the door all blistered.

And then I knew a devouring fire was raging in that room. Keep it there! Don't open the door! Don't let the fire spread!

Upstairs I flew and rattled hard at Brett's bedroom door. No answer! Both he and his wife were fast asleep. I tried the door. It yielded. Without ceremony I entered, and, going to Brett's bed, shook him.

"Wake up! Wake up! I want you!"

Brett awoke.

"Margaret worse?" he asked. Margaret, his only child, lay seriously ill in bed, and a hospital nurse attended her.

"No, just come outside, will you? Quick!"

Brett sprang out of bed, and followed me out of the room.

I explained everything hurriedly. Brett was calmness itself.

"Explanations and thanks afterwards, old man," he said, "now is the time for action. We must be ready to leave the house. But poor Margaret! She must not be moved, unless we can possibly help it. Removal will kill her! She can't stand it. But, of course, if the fire spreads, she must be got out. But I know it will kill her! I only pray that the fire can be stopped in time. The drawing room door must be kept shut. I will arouse the rest. You run round to the Post Office, knock them up, and get them to telegraph to the fire brigade."

**A Mad Race for the Fire Brigade.**

Round to the Post Office I rushed. Just as I was. Pyjamas, jacket, slippers. In my excitement, I felt no cold! It took some minutes to awaken the postmaster. At last he came, wondering at the furious knocking.

"What's wrong?" said he.

"Mr. Brett's house is on fire! Please telegraph for the fire brigade."

"Good gracious!" cried he. "I'll try. But I doubt if there's anyone at the other end."

The postmaster rushed to the instrument, and began rap—rap—rapping.

But he rapped in vain for some minutes.

"I'll keep on trying," he said, "but I'm afraid there is no one there to receive the message. You had better send a man in on a horse."

"Where is the fire station?" I asked.

"Marketown. Six miles of hilly road!"

I dashed madly back to the house. "Six miles! I might do it in ten minutes—over forty miles an hour in places—moon has risen—won't trouble about a lamp—hope to get the fire-engine here in three-quarters of an hour!"

The house was now all astir. People were about. The fire could be heard crackling in the drawing room. The floor above was hot, and likely soon to catch!

I quickly detailed the result of my visit to the telegraph office, and explained that I was off to Marketown on my motor bike.

"Drive like mad," cried Brett, "and fetch them here to save the house. If they save the house, they save my daughter! If I move her, I kill her!"

There were helpers now, but little water. All they could do was to keep the drawing-room door and also the floor of the room above the drawing-room constantly splashed with pailsful of water. Thus they hoped for a time to keep the fire from breaking through.

Now I am on the road, a little better clothed, but

chilly enough. Heading for Marketown. Driving for a life! Willingly the engine pulled, with cut-out open and throttle wide, and carburettor feeding all the gas the pipe could pass. Greedily the engine sucked the petrol vapour in and wondrously transformed it into power to drive the wheel. Busily clicked the valves, nor failed to shut and open wide at their appointed times. The failure of one little part would mean a dear one lost! The hill-top reached, a flat stretch of road stretched out before me. And now the pace grows fierce, and fiercer yet! The engine roars, the right air whistles past my ears. A bumpy road just here, and, farther on I know, a patch of new laid metal lies to try my steed still more. But what's the use of slackening? I'll take it at this pace, and fly above the stones! I'm mad with speed! It's fifty—fifty miles an hour! How goes the fire behind me? Are they keeping down the flames? They're waiting anxiously enough for me, I know, with news that help is on the way. That patch of stones! It's here, it's—cra-a-a-sh! A rolling, leaping, sliding, side to side! The engine slows, but not for long. I find it hard to

"Cra-a-a-sh! I am on the edge of the ditch."

**Driving to Save a Life.—**

steer. I am on the edge of the ditch when the unrolled road at length is safely passed.

**The Fire Engine on the Road.**

And now the town's bright lights! The tram lines, free from grease, are quickly traversed, and the fireman's nap is rudely broken by my hammering on the door. The message given, I only wait to see the horses pull the engine from the shed. And then I go before them, returning to the fire to tell my friends the engine's on the road!

How goes the fire? I find it has broken through the floor, and is lapping up the walls around the room above. But the furniture has been moved from here. Wise thought. The door below has stood the strain. Good hardwood door! But it cannot last much longer.

Miss Margaret's not been moved as yet I hear. If all goes well, she need not have that pain. She does not even know the house is being burnt around her. She's far too ill for that.

And now it's time the men were here. The door has split, and flames are licking through! Once the door is down the stairs will be in danger! And then the invalid must be moved. More water, more! Quench the thirsty flames! The flames that put their tongues through every crevice they can find!

**Anxiously Awaiting the Firemen.**

Will the firemen never come! With their engine and hose, and water from the pond.

"Run out, someone, and see if there's a sign of them," Brett cried, in agonised tones.

I went into the road. Nothing in sight. I listened. No sound of—but hark! what is that? Bells, jingling bells! Very faint. The sound has died away. There it is again! Yes, they are coming! And now the sound of wheels; then the thud, thud of galloping hoofs. At last, around the bend, the lights appear, and the fire engine comes jingling, rattling, crashing up, and stops with the horses on their haunches. Down jump the men! Out comes the hose! The

captain runs into the house, and is out again in half a minute. Soon the hose is in the pond, the engine is pumping and driving a powerful stream through the drawing room window. Another stream is played upon the room upstairs, and in ten minutes the danger is over.

"Around the bend the lights appear, and the fire engine comes jingling, rattling, and crashing up."

Another quarter of an hour and the stairs would have been impassable!

And so a life was saved by my trusty motor bicycle.

\* \* \* \* \*

Brett now rides a motor bicycle, and he is going to get a sidecar for Margaret. R.W.

**USEFUL HINTS TO WINTER RIDERS.**

**N**OW that the days are short and the roads are heavy, a few hints collected from riders of long experience may be of use, especially to those who have recently joined the ranks of motor cyclists.

Keep warm. Always put on more clothes than you think you will need. You are not likely to be too hot and it is misery to be too cold.

Either long boots and good leggings or Wellington thigh boots are essential to comfort in bad weather. There is no head gear to equal a good "sou'wester" to keep out the rain.

If the lamp connection is too long, wrap it round the handle-bar or some other convenient spot, otherwise when you go over a bump it will "kink" and put your lamp out.

Always carry a pocket electric torch; it is invaluable for night repair work and for examining signposts.

If you have drip-feed lubrication you will probably have to reset the drip or use thinner oil, as thick oil becomes almost solid in cold weather.

Gear considerably lower in winter; it gives your engine a chance and saves many a skid.

If your machine has a lot of plating on it (which it should not have), clean it and cover it with vaseline.

If your magneto terminals are exposed, cover them with a thick layer of vaseline, or, better still, rubber covers sold for the purpose.

Those who compete in winter trials should keep their route card in a waterproof case or varnish it, otherwise it will probably be reduced to pulp long before the end of the trial.

Gloves that have a pocket for all four fingers are the warmest, but some form of gauntlet should be used.

Many tips are given for fog riding, most of which are more or less useless. A yellow light appears to be the best for the purpose, so that if your lamps have not brassed reflectors, try thin yellow linen or, if obtainable, yellow glass on the inside of the lamp. Some forms of electric light are also excellent. The most important point, however, is to drive slowly.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the "Editor, The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

### Judging Distances with One Eye.

Sir,—I am the man Dr. Selby Clare is looking for, or one of them.

I lost an eye from a guncap accident at about the same age as the gentleman the doctor mentions, and, also, just as I was starting motor cycle riding.

That happened ten or eleven years ago, and since then, thanks to the motor, I have had the most enjoyable time of my life. First solo, and later with my good lady (and others) in the sidecar, I have been through nearly all the towns and villages in the Midlands, have ridden through the thickest traffic of many large towns: Birmingham, Coventry, Worcester, Bristol, York, etc., and I have toured the East Coast, main part of the South of England, Devonshire and Wales, and never made a mistake or been at a disadvantage through having to depend on the one optic.

My accident happened when I was seriously considering whether I should not take to glasses, so my sight is not above normal.

At first I experienced the difficulty mentioned by Dr. Selby Clare. If I went into a garden nothing was very clear for a time, but now I guarantee to pick out a ripe strawberry (and eat it) with anyone. In my business I have to judge between objects  $\frac{1}{16}$  in. and  $\frac{1}{32}$  in. different in size, and for a time was at fault, but that corrected itself as the eye got used to the altered focus. The same applies to my judgment of distances, and I can size a thing up as correctly as most people. I have no difficulty in taking my engine down, doing my own minor repairs, attending to magneto points or other small details.

Now I think my case ought to be comforting and encouraging to the doctor's patient, who, I hope, will not worry about his riding in the least. I feel sure he will be all right later on; but should he find any difficulty, why not call round for me? He has lost his right, I have lost my left, we could make up a good pair between us and get on all right with

PETROL.

Sir,—In reply to Dr. Clare, I should like to say that his patient need not lose heart as regards giving up motor cycling, as no doubt he will get quite used to judging distances with the remaining eye. In 1911 I rode through the London-Edinburgh run (with sidecar) with one eye covered up (the result of an accident at the lathe). Probably starting in the dark and daylight coming gradually allowed me to get used to the altered vision, but I did not notice any difficulty in judging distances; in fact we returned through the winding roads of the Lake District.

GEORGE WRAY.

Sir,—I hope you will again allow me to trespass on the valuable space of *The Motor Cycle* to thank my numerous correspondents who are motor cyclists minus an eye, and who so very kindly gave me their experiences and difficulties. The number of letters I have received makes it quite impossible to answer and thank each correspondent individually.

Their replies have been most comforting to my patient, and he now looks forward to the dry roads to learn to ride his motor cycle again depending on one eye.

I have heard of one-armed and one-legged motor cyclists, but one would never believe there were such numbers of one-eyed motor cyclists.

Who says that the "motoring brotherhood" is dead when so many men have gone to such trouble to write in full their difficulties in reply to my enquiry? Truly, sir, our conjoint sport is one which can be participated in by "the halt, the maim, and the (partially) blind."

(DR.) SELBY CLARE.

### The Application of Brakes.

Sir,—Consequent upon the development of machines fitted with variable gears and starters, a need has arisen which I was surprised no exhibitor at the Show seemed to have recognised. I refer to the control of the brakes. There are many times when one would like to keep one of the brakes on without having to keep either hand or foot on it, as, for example, when starting the engine on an up gradient, or when descending a long hill.

My idea of the best way of doing this is to control one of the back wheel brakes by a twisting handle, or in the case where only one is fitted this control would be in addition to the pedal.

I do not care for the ordinary twisting grip, and would prefer one in which a slightly enlarged knob at the end only rotates, and as it is not essential that this control should be very rapid in action a screw with a finer pitch than is usual for twisting handles would give the necessary power and would retain the brake on when desired.

I had drawn up a specification for a differential counter-shaft, but the description you published on November 28th of Denby and Co.'s showed me that I had been anticipated. May I point out that this counter-shaft possesses the advantage one of your contributors has been asking for, viz., it is not possible for a belt to get lost without the driver's knowledge, as if one comes off the other pulley immediately opens out and the belt slips. It also has the advantage that it automatically divides the load between the two belts, whereas in the ordinary fixed pulley counter-shaft if the belts or pulleys differ in size it is possible for one belt to be actually acting as a brake.

C. S. SQUIRE.

### A Clean Design.

Sir,—I write to you to "back up" Mr. T. F. Maw's argument, as I thoroughly agree with his statements, having found from personal experience the chain very much more satisfactory than the belt.

I also wish to say a few words in praise of "A Clean Design," appearing in the same issue. There are, however, one or two points which I would like to comment on. The first is the combined drive. Instead of this I would suggest final transmission by shaft, or enclosed chain, as on the Lea-Francis.

Disc wheels are also shown. These, I think, would make the bicycle extremely troublesome in a high or even moderately high wind. I would advocate a sort of artillery wheel, the spokes of which could be made out of galvanised steel rods which would thus be rustless. I imagine also that a Green type water-cooled engine might be less liable to radiator trouble in the event of a fall.

The foregoing changes would, I think, make the machine more weatherproof and less liable to damage.

WATER-COOLED CHAIN DRIVE.

**Silence.**

Sir,—Having read with interest the many letters and articles in *The Motor Cycle* on silence, may I point out a few obvious advantages of a silencer cut-out.

To the keen motor cyclist who desires to obtain the best results from his engine a cut-out is a necessity, as with a noiseless exhaust it is almost impossible to tell if one has a perfect mixture. Further, with an open exhaust any foreign noises and the slightest knocking in the engine are plainly audible.

NORTHAMPTON.

Sir,—I have been forced to the conclusion, after regular reading of "Ixion," that he knows what he is talking about, notwithstanding the apparent doubts of your correspondent "Silentius."

Individually, my experience of the silent car is that it is a positive nuisance both to the driver and the public. The driver because his hand has to be constantly on the horn in traffic, and to the public because a horn startles.

I had on my present  $3\frac{1}{2}$  h.p. a horn that was not a good one, and, though a careful driver, found to my cost that with my cut-out closed in traffic I was not safe.

One day I was passing a lorry, the driver of which was sitting on the wrong side (left). A boy was in the driver's seat, and although I blew the horn vigorously, the boy dropped off the lorry on to my front wheel. Had my cut-out been open, I am of the opinion that we should not have been mudlarking.

AD SUM.

**A Substitute for a Differential.**

Sir,—In your issue of the 28th November you illustrated and described a differential counter-shaft in which a large V belt pulley is mounted on a tubular shaft carried in bearings; to the outer ends of this tubular shaft are fixed one half of a V belt pulley, the other halves of which are carried by the solid shaft passing through the tubular one and having end play, and thus giving a differential action with, perhaps, a negligible want of alignment of the belts. I want to state that I designed such a mechanism some years back and afterwards improved it by pinning or feathering the inner shaft so as to take part of the drive, and also, by mounting the large driven sprocket, not on one tube, but in halves on the inner ends of two tubes; then, by moving the counter-shaft forward or aft, a change of gear is effected in what is probably the most efficient and simple manner for belt drives. I have not adapted it in my cycle car because of the large amount of power, quite 40%, necessarily wasted in each belt drive.

A. EDMUND PARNACOTT.

**Improvements in Motor Cycles.**

Sir,—I am pleased to see that "Ixion" is having a growl at motor cycle manufacturers in general. Some time ago a number of well-known trade riders were discussing the same topic, and each of them complained of the aversion manufacturers manifested to make any much needed improvement on their machines. The one conclusion we came to was that, until a slump comes along, we are not likely to get much attention bestowed on our suggestions. It is always a surprising thing to me to see a firm engage an enthusiastic and expert rider very often at a high figure and yet (more often than not) totally ignore his suggestions for improving the machine.

A man who is practically living in the saddle and continually travelling up and down the country soon knows (if he keeps his eyes open) what is wanted, and, more important still, what will be wanted in the motor cycle line, yet his suggestions and ideas are simply shelved and the old design of frame and engine turned out again for another twelve months, simply because at present the demand for motor bicycles is equal to the supply. When the slump comes we shall get our improvements, but when the slump comes it will mean the survival of the fittest, and the few go-ahead and progressive firms will reap their reward. Many of the others will, I am afraid, go the the wall because mere copyists are always twelve months behind. However, the slump will be a blessing in disguise. May it come soon is the wish of

TRADE RIDER.

**The Transmission Question.**

Sir,—I am glad to see "Ixion" taking up the case of the "dropsical elderly man," in relation to motor cycles. Better springing of the back wheel is, of course, very much desired by most of us, but better weatherproof qualities are a crying necessity. The youthful hill-devouring enthusiast will have his day, but certainly the all-weather business man will prove a more reliable market in the long run. In the issue of December 12th is illustrated a well meant attempt to mudguard a belt-driven machine. I have tried that, and regard it as hopeless. It is not necessary that the belt should be, like the poor, always with us. Its reappearance in the combined drive is, I suppose, a dreadful example of the survival of rudimentary and unnecessary organs.

I entirely agree with Mr. T. F. Maw's remarks in your paper, but should like to point out that there are actually shaft-driven machines with satisfactory clutches on the market, though they are not yet superior to belt-driven machines by "Ixion's" test of universal popularity. Having owned a shaft-driver with a good clutch and gear box for two and a half years I am quite convinced that this form of transmission is incomparably superior to belt drive and far better than chain. For six years I did all the work I could on belt-driven machines of various good makes, and had to keep a horse for the winter work. Since investing in the shaft-driver I have done all my work for three summers and two full winters on it. The horse has been sold, and this machine has been running practically every day over very bad roads and its mileage is now over 12,000. During this time the transmission has never failed, and has only been disturbed to remove the back wheel for tyre changing. The clutch control has been adjusted once and gear box drained of oil once after 11,000 miles had been covered. The oil ran out as clean as when put in, which sounds incredible, but it is true. There is no appreciable wear in any part of the transmission, which runs a shade better than when new. Belt enthusiasts please note! This form of drive does not necessarily spell short engine life, as the engine ran 11,000 miles before any repairs were needed. These were one new big end bush, one main bearing bush (flywheel side), and a new piston and rings, total cost about 15s. (I do my own repairs.) This is much better than anything I had previously owned.

Need I add that this shaft-driven machine is much cheaper to run than the others, that I am a country doctor, and not interested commercially in any form of motor vehicle.

F. C. JAMES.

Sir,—I was very interested to note that the question of transmission is again under discussion. There is no point on the modern motor cycle that is so much lacking in perfection. I note Mr. Maw favours the chain drive and is somewhat hard on the merits of the compound drive. While agreeing with most of his statements I take exception to others. Firstly, he states that the compound drive cannot be fitted with an adjustable belt pulley. Why not? An adjustable pulley can be fitted to the counter-shaft, though the same variations in gear ratio cannot be obtained as in the direct belt drive, owing to the large pulley used in the counter-shaft gear. Secondly, he states that engines used

Valve side of the three-speed Grandex fitted with  $3\frac{3}{4}$  h.p. Precision engine. Observe the combined trouser guard and cover for the valves.

with chain drive are just as light and lively as engines used on belt driven machines, and "wear as well." But it is not only the question of engine wear that must be taken into consideration, it is the back tyre and transmission that suffers mostly—with a rigid drive—and undoubtedly makers have favoured the compound drive as against the entire chain drive, solely on account of the harshness of the latter. Unfortunately the compound drive, though more efficient and reliable than the all belt drive, is still very inefficient. But, as against that, the all chain drive, unless containing an efficient shock absorber, is far too harsh, is noisy, the chains quickly stretch, thus ruining the initial higher efficiency of this drive, and must be enclosed to be really satisfactory. This latter is not easily carried out and also adds the great drawback of inaccessibility. Mr. Maw states that "so soon as the shaft drive is fitted with a satisfactory slip clutch mechanism this drive can compete with the chain—but will always be more expensive." The only known shaft driven machines already on the market are so fitted and always have been (with the exception of the earlier models of the four-cylinder F.N., but the even torque of a four-cylinder engine practically does away with the necessity of providing for the absorption of shock (the same reason applies, of course, to twin two-stroke machines). Also, it is questionable if a shaft drive does cost more than a chain drive.

The ideal system, of course, can only be one in which the unequal turning moment of the engine can be transmitted to the back wheel as an even torque without any slip at all, or any loss of efficiency. Therefore the uneven impulses of the engine must be absorbed and given out again at an even rate. As it is not feasible on a motor cycle engine to fit a large flywheel to absorb and so equalise this uneven turning moment, the greater part of the duty falls to the transmission system.

A properly designed shaft is positive but flexible. It is the torsional elasticity of a shaft that constitutes its great advantage over the chain, the shaft itself absorbing shock and giving out the power again with practically no loss. No shock absorbing devices already devised or used in connection with chain drive can anything like compare with the shaft drive on this point alone. In fact the shaft practically equals the belt in the question of flexibility, and easily beats it in the question of efficiency. Further, the shaft drive is simple, absolutely reliable, absolutely cleanly, all being enclosed, and is very neat, and the wear almost nil in comparison with belt or chain. At least 10,000 miles should be covered without any replacements. Though the cost of the shaft drive is somewhat high in the first case, this is more than compensated for by decreased cost of repairs, to say nothing of its greater reliability and freedom from trouble. As soon as the exceptional merits of shaft drive are realised by riders, its use will become almost universal, and it is the only system that can substantiate the makers' favourite advertisement "The all-weather machine." W.M.

### Counter-shaft Gears and Belt Drive.

Sir,—I notice that a discussion is taking place, through the medium of your columns, as to the respective merits of belt and chain transmission.

The problem of transmission will be largely influenced by the position of the change-speed gear. The best modern practice in change-speed gears is to provide three speeds, the lowest being an emergency gear (so long advocated by *The Motor Cycle*), and, therefore, giving a ratio of 10 or 12 to 1. This very low gear is undoubtedly necessary and will probably be general for next season.

It will be fairly obvious to most readers that if we place our change-speed gear in the counter-shaft position we at once rule belt drive out of court, the reason being that when our very low emergency gear is in use an enormously increased driving stress is thrown on the final unit of the drive, coincidently with a big fall in its speed. If the final unit is a belt, it is very much overloaded when the emergency gear is in use (and it is frequently in use), and belt slipping, stretching, breaking etc., will be much more frequent than at present. It will also be obvious that when we have a 10 or 12 to 1 gear in use the belt speed falls extremely low. The result is that we get a very inefficient drive, and a drive that fails just when failure is least desirable.

On the other hand, if we place our change-speed gear in the hub the belt is never overloaded on any speed, and the belt speed never falls, so that our drive is very efficient.

If a counter-shaft gear has only a moderately low bottom speed (say about 7 or 8 to 1) belt drive is quite satisfactory, but the inclusion of a very low gear means that a chain will have to be substituted for the belt, otherwise the drive will always be unsatisfactory.

As belt drive is so popular (and deservedly so in my opinion), the hub gear is undoubtedly the best to use with it—a fact that has been recognised by all our big firms.

I believe very great headway is being made in the development and construction of hub gears, and there is no doubt but what their present minor drawbacks will soon disappear.

ENGINEER.

### The Wear of Small Engines.

Sir,—It was my original intention not to take any notice of letter in your issue of 28th ult. by Mr. Stich, criticising my statements to "Ixon" on above subject; but as my friends expressed surprise and regret that I have not yet taken the trouble to clear myself, I now briefly state that the points questioned in Mr. Stich's letter had my careful consideration before writing, and I cannot admit that they have any bearing on the subject, and Mr. Stich now knows this to be true.

W. HUTCHISON.

### Second-hand Machines.

Sir,—Having suffered from misstatements in regard to F.N. motor cycles in advertisements of second-hand machines, we are constrained to write and point out in what year each particular model was made.

We have recently seen advertisements of 4½ b.p. four-cylinder F.N.'s being termed 1911 models.

The 4½ h.p. four-cylinder was introduced in 1907, and was not made or sold after 1909. In 1903, a 5.6 h.p. model (50 mm. bore) was introduced and sold throughout that year and 1909. This was followed in 1910 by a bigger engine (52½ mm. bore), and called 5.6 h.p., and this particular size of engine is still in use.

The first single-cylinder shaft-driven machine was introduced at the end of 1909, rated at 2½ h.p., and sold until the end of 1910. This can be distinguished from the next model by the leather-covered cone clutch fitted.

At the end of 1910 an improved model with multiple disc clutch was introduced, and this was sold until May, 1912, when the first of the latest 2½ h.p. machines was introduced.

The 1½ h.p. belt-driven model with geared down engine belt pulley was introduced in 1907, and sold right through to the middle of 1909.

We shall be glad if you will bring these facts to the notice of readers, so that they can protect themselves against those who advertise machines as of a certain year when in reality they are at least two years older.

For F.N. (ENGLAND), LTD.,

H. G. BELL, Sales Manager Motor Cycle Dept.

### Defective Fittings.

Sir,—Having read several articles in recent issues of the motoring press re shoddy methods on the part of manufacturers with regard to nuts and bolts and the lesser fittings of motor cycles, I should esteem it a favour if you could find room for the following glaring instances, which have lately been brought to my notice, and which seem to me to reveal a very loose link in the construction of a machine intended, as a motor cycle is, to carry a considerable burden of weight.

A few weeks ago I drove my machine (a lightweight) some ninety miles, part of which distance traversed the well-known Shap Fell. When nearing my destination—Carlisle—I became aware of a slight squeak in the springs of the front forks. On garaging the machine, I grasped the handle-bars lightly, and gave one or two up and down motions, sufficient to depress the springs a quarter of an inch or so, endeavouring to locate the squeak. Imagine my surprise when I felt the whole handle-bar give way several inches in my hands. On inspection I found that the bars (which were of the forward lug variety) were hanging on to the steering pillar by a mere shred of metal; in fact, they subsequently dropped off with their own weight. The bars were lin. and the steering pillar ½ in. diameter. After the usual delay, I had a new pair of bars fitted, only to find that in less than one week's riding the

new steering pillar had bent at least a quarter of an inch out of truth. Having had this straightened out, I find that in another week the steering pillar is again developing a list.

Still more recently I was in an agent's shop, when I was shown the "remains" of a motor cycle, the result of the handle-bars snapping off by the steering pillar. I do not know what became of the unfortunate rider, but the machine looked as if it had been trying conclusions with a stone wall. In this case both the bars and steering pillar were of 1 in. diameter, but in both cases the metal of which the steering pillar was formed seemed to be barely  $\frac{1}{16}$  in., and the fracture occurred at the joint of the pillar with the bars. It strikes me forcibly, although I am but a novice in such matters, that manufacturers should pay more attention to the tremendous stress and strain bound to be felt in this, the most vital part of a machine, and on the strength of which a rider's life constantly hangs.

I do not know whether such events as the above are of frequent occurrence, my motor cycling experience only dating from some three months back, but to come across two cases in one month shows that something must be wrong.

N.E.S.

### Benzole.

Sir,—Perhaps you would be interested to know what pleasing results I am getting from benzole. I have not made any alteration to carburettor (B. and B.); the only thing I find necessary is to give more air with extra air lever. My machine is an 8 h.p. J.A.P. engined cycle and sidecar, and I must say it pulls a great deal better with benzole than petrol. Other riders' experiences with this spirit would be very interesting.

CANNOT AFFORD PETROL.

### Cycle Cars.

Sir,—I noticed in your issue of December 12th, in a report of a discussion on cycle cars, that one gentleman referred to having driven his Morgan runabout four or five miles on low gear, putting this forward as evidence of the utility or safety of an air-cooled engine in a cycle car.

I may state that on a twelve hours' reliability run I had the misfortune to damage my high gear on a similar machine when over sixty miles from home, and drove that distance on the low gear, frequently exceeding 20 m.p.h., without the slightest indication of overheating, and further that while in Ireland in October I snapped my high gear chain, and, while waiting for a new one, drive eighty miles quite comfortably on the low gear without doing any damage to the engine.

I have had a season's trial of the Morgan, and in spite of many mishaps it is running now better than the day I got it, and I would not exchange it for any water-cooled cycle car

on the market. I have had no trouble through skidding, and have yet to meet the hill it will not climb with two up. I have had no punctures in back tyre in 4,500 miles.

A. W. MONTGOMERY.

### Sidecar Spindles.

Sir,—We would like to point out to your correspondent, "AF 274," that if he desires a large margin of safety on his sidecar he must be prepared to pay a higher price than £6 10s., which he stated was the cost of his present sidecar. If "AF 274" were to examine some of the best makes of sidecars he would find that there is a much greater difference between the low priced and the expensive models than merely the difference in the body.

In addition to the wheel spindle there is the frame generally, and the points of attachment to the cycle particularly to be considered, and people cannot reasonably expect a low-priced article to stand the same amount of knocking about as a better one.

Where price is a factor to be taken into serious consideration in the purchase of a sidecar, buyers would be much better advised to spend all the money in the chassis and rest content with the very cheapest type of wicker chair. This would be much more satisfactory all round than purchasing a cheaply got up imitation of a first-class sidecar.

NORTHERN DEPOT, LTD.

S. K. BROADFOOT, Managing Director.

### Weatherproof Finish.

Sir,—Once again as winter approaches, motor cyclists, as shown by your correspondence columns, turn their attention to protecting their machines against the ravages of rain and mud.

Now are all-weather motor cyclists prepared to pay from 10s. to 15s. more per machine if it is guaranteed not to rust or corrode? I recently heard of a new process which should answer the demand perfectly. I do not think it has been mentioned in *The Motor Cycle*.

The preparation is called Pellolit. It is built up in layers on the metal, being stoved and rubbed down several times, and forms a hard protecting coating on the metal.

Pellolit has properties which should appeal to motor cyclists. First it cannot chip or crack. It is unaffected by acids, or alkalis, or damp. It is a non-conductor of heat and electricity, and will stand a temperature of over 400°F. In appearance, like ebony, it can be finished dull or polished.

Can you, sir, give us any experience with Pellolit? At present, I believe it is a new thing. Who will be the first to market a motor cycle in Pellolit finish, with no nickel to clean or daub with vaseline and no enamel to be scraped off at every spill?

O.C.K.

## CLUB NEWS.

### Winchester and District M.C.C.

The annual general meeting was held on the 10th inst.

### Oxford M.C.C.

The annual meeting will be held on January 6th, and the annual dinner on January 25th, at the Hotel Buol, Oxford.

### Merthyr M.C.

The annual whist drive and dance took place on the 12th inst., during which Mr. E. Gunter presented the prizes won during the year. The attendance was good and a most enjoyable evening was spent.

### Tyldesley and District M.C.C.

The hot-pot and smoker held on the 11th inst. proved very successful, the social being thoroughly enjoyed. The new club commenced its career with a membership of forty-nine.

### Bradford M.C.C.

The sixth annual dinner and presentation of prizes and medals won during the past season took place on the 10th inst. at the Albert Buildings. Mr. Percy Butler presided, and an excellent musical programme completed the evening's entertainment.

### North Derbyshire M.C.C.

This new club has already over seventy members. The management is to be strictly in the hands of amateurs, although trade riders are welcomed as ordinary members. Hon. sec., Mr. W. Brown, headquarters, the Station Hotel, Chesterfield.

### Ayr and District M.C.

The annual smoking concert and presentation of prizes took place on the 16th inst. at the Hotel Dalhlaire, Ayr. The president, Mr. John Hourston, occupied the chair, and presented the prizes, the chief event of the evening being the handing over of the President's Cup, for the best average marks gained during the season, to Mr. James Gilchrist.

### Sydney M.C.C. (N.S.W.)

The non-stop reliability trial, held on October 5th, was won by V. H. Page (3½ h.p. Zenith) with a loss of three points; second, R. E. Fletcher (3½ h.p. B.S.A.), six points; third, R. W. Allan (3½ h.p. Zenith), nine points. The trial was over a distance of seventy-eight miles and included the famous Blue Mountains. Motor bicycle competitors had to average 21 m.p.h. and sidecars 18 m.p.h.

# M.C.C. LONDON-EXETER RUN.

The Time-table, Complete List of Competitors, and their allotted Numbers.

**M**ANY of our readers on or near the route of the annual London-Exeter run will find the time-table below of great convenience for reference. We give also the numbers allotted to the various competitors and the machines they are riding. This year the entries total 163; last year there were 119.

Mr. F. T. Bidlake will despatch the first competitor—E. B. Dickson, the trials hon. sec.—from Hounslow at 7.0 next Friday evening, and he is due at Exeter at 5.4 a.m. Starting back at 6.34 a.m., he is due at Hounslow at 3.40 p.m. The tail-enders will finish in darkness.

## ROUTE AND TIME-TABLE.

The times given are approximately the times of first arrivals.

OUTWARD.			HOMEWARD.		
Distance from			Distance from		
Start.	Time due.		Start.	Time due.	
Hounslow ...	7.0 p.m.		Exeter ...	161 6.34 a.m.	
Bagshot ...	16 7.53 "		Lyme Regis ...	189 8.1 "

## List of Competitors.

1. E. B. Dickson (8 Bat)	23. W. H. Bashall (7 Matchless sc.)
2. H. G. Bell (5 F.N.)	24. J. T. Bashall (7 Matchless sc.)
3. W. H. Wells (7 Indian sc.)	25. A. Bashall (7 Bat sc.)
4. N. O. Soreby (3 1/2 Rudge Multi)	26. A. T. Tamplin (9 Matchless cycle car)
5. P. W. Moffat (2 1/2 Douglas)	27. C. W. Meredith (3 1/2 Bradbury)
6. W. E. S. May (8 Matchless sc.)	28. H. Gibson (3 1/2 Bradbury sc.)
7. E. J. Hancock (3 1/2 Premier)	29. H. B. Willoughby (6 Steller sc.)
8. A. E. Carr (3 1/2 Triumph)	30. O. Percival (2 1/2 Douglas)
9. R. C. Davis (5-6 Clyno sc.)	31. J. H. Kerr (3 1/2 N.S.U.)
10. H. G. R. Slingo (5-6 Clyno sc.)	32. P. Grout (6 A.J.S. sc.)
11. F. Smith (5-6 Clyno sc.)	33. W. B. Gibb (8 Williamson sc.)
12. H. Karslake (3 1/2 Rover sc.)	34. W. O. Henry (5-6 Clyno sc.)
13. R. R. Rothwell (8 G.W.K.)	35. L. A. Baddeley (—)
14. O. G. Roberts (3 1/2 Green-Zenith)	36. D. S. Baddeley (3 1/2 P. and M. sc.)
15. H. O. Mills (3 1/2 Regal-Green)	37. P. D. Walker (3 1/2 Rudge sc.)
16. S. F. Garrett (3 1/2 Regal-Green)	38. F. C. Hayward (6 Zenith sc.)
17. R. B. Clark (3 1/2 Rudge sc.)	39. R. O. Mundy (3 1/2 Triumph)
18. P. Newbold (5 Zenith sc.)	40. F. A. McNab (3 1/2 Ariel)
19. E. G. J. Charlesworth (6 Zenith sc.)	41. W. P. Guiver (3 1/2 Ariel sc.)
20. H. Johnson (3 1/2 Triumph)	42. C. H. Konwehoron (3 1/2 Ariel)
21. Phillips (3 1/2 Douglas)	
22. R. Chesterfield (7 Indian sc.)	

## BIRMINGHAM-YORK AND BACK.

Below we give a list of entrants for the Birmingham M.C.C. second annual winter run to York and back on the 28th inst.:

1. S. A. Rowlandson (3 1/2 Rudge sc.)	14. J. E. Greenwood (2 1/2 Sunbeam)
2. R. W. Duke (3 1/2 James sc.)	15. E. V. Pratt (6 H. and D. sc.)
3. S. C. Perryman (3 1/2 Quadrant)	16. H. Newey (2 1/2 Lewis)
4. L. Newey (3 1/2 Ariel)	17. Cecil Peers (2 1/2 Forward)
5. F. E. Farmer (3 1/2 Calthorpe)	18. Geo. Hill (3 1/2 Rudge)
6. T. Pollock (3 1/2 James sc.)	19. Tom Silver (3 1/2 Quadrant)
7. Bert Yates (8 Hummerette)	20. D. A. Pearson (3 1/2 Trump-Jap)
8. H. Ball (3 1/2 Triumph)	21. A. W. Walden (9 Premier cycle car)
9. E. I. Slattery (6 Trump sc.)	22. A. E. Hawkins (3 1/2 Premier)
10. E. C. Sauter (3 1/2 Ariel sc.)	23. E. H. Brown (6 Rex Sidette)
11. A. G. D. Cress (3 1/2 New Imperial)	24. V. Busby (3 1/2 Ariel)
12. H. B. Davies (2 1/2 Sunbeam)	25. Eric Walker (3 1/2 Monarch)
13. W. H. Egginton (3 1/2 New Hudson sc.)	26. V. Underhill (3 1/2 Monarch)

## OPEN WINTER TRIAL.

The Bournemouth M.C.C. are holding an open winter reliability trial on the 8th January. The distance is 130 miles and the route is: Bournemouth, Dorchester, Yeovil Shaftesbury, Fordingbridge, Bournemouth. Three test hills will be officially observed, and to gain full marks competitors will be required to make clean ascents. Another hill will be selected for a slow climb.

The competition will start at 9 a.m., and competitors must assemble at King's Park, Bournemouth, by 8.20 a.m. Competitors who arrive within schedule time will be awarded 100 marks. For each clean ascent on the observed hills fifty marks will be awarded, and the competitor who makes the slowest time in the slow climb will be allotted fifty marks.

43. B. A. Hill (8 Hummerette)	107. C. T. Newsome (3 1/2 Rover sc.)
44. R. Brown (8 Crouch carrette)	108. D. H. Noble (3 1/2 Rover sc.)
45. D. S. Parsons (8 G.W.K.)	109. H. E. Davison (3 1/2 Kerry-Abingdon)
46. V. Pratt (3 1/2 P.M. sc.)	110. P. Hann (10 Pinnace light car)
47. A. C. Evans (6 A.C. Sociable)	111. J. S. Heyrod (3 1/2 Motococche)
48. J. A. Hunt (3 1/2 F.N. sc.)	112. C. P. Hovey (3 1/2 Rudge sc.)
49. T. J. Rosa (3 1/2 Triumph)	113. F. W. Carrier (3 1/2 New Imperial)
50. W. H. Egginton (3 1/2 New Hudson sc.)	114. M. Geiger (8 V.S. sc.)
51. G. L. Drew (3 1/2 Premier)	115. H. A. Sudfeldt (6 V.S. sc.)
52. G. B. Barham (6 Rex de Luxe)	116. E. B. Ware (8 Chater-Lea sc.)
53. W. P. Tippet (2 1/2 Hummer)	117. Dr. C. B. Moss-Blundell (6 Imperial)
54. C. D. Wright (3 1/2 Hummer)	118. S. H. Beal (3 N.S.U.)
55. H. A. Playfair-Robertson (2 1/2 Premier)	119. J. L. Love (5-6 A.C. de Luxe)
56. O. Hill (8 G.N. cycle car)	120. E. D. Babington (8 Bat)
57. A. G. Peppercorn (3 1/2 Bradbury)	121. Rear-Admiral Sir R. K. Arbuthnot (3 1/2 Triumph)
58. W. H. Elce (3 1/2 Rudge sc.)	122. R. H. Guest (7 Matchless sc.)
59. A. Adecock (2 1/2 F.N.)	123. C. E. Collier (5-6 A.C. Sociable)
60. E. O. Clark (5 F.N. sc.)	124. G. W. Marsden (3 1/2 Bradbury sc.)
61. C. S. Franklin (6 N.S.U. sc.)	125. H. A. Cooper (3 1/2 Bradbury sc.)
62. J. A. Neumann (6 Rudge sc.)	126. L. W. Fox (3 1/2 Hampton)
63. S. J. Saunders (6 Rudge sc.)	127. J. Chater Lea (8 Chater-Lea sc.)
64. R. E. Lucy (3 1/2 Rudge)	128. E. B. Jourdan (3 1/2 Bradbury)
65. R. M. Astou (3 1/2 Bradbury)	129. H. Ellis (6 Calthorpe sc.)
66. F. C. North (8 Matchless)	130. R. Ellis (6 Calthorpe sc.)
67. V. H. Barnard (3 1/2 Bradbury)	131. J. Peachey (3 1/2 Premier)
68. G. F. Pither (8 Duo cycle car)	132. G. Griffith (8 Zenith sc.)
69. F. G. Watson (3 1/2 Swift sc.)	133. A. H. Ratcliffe (3 1/2 B.S.A.)
70. W. Cooper (10 Hummerette)	134. E. R. Cass (10 Gordon cycle car)
71. R. Holloway (3 1/2 Premier sc.)	135. H. F. S. Morgan (8 Morgan runabout)
72. N. O. Dear (3 Connaught 2-st.)	136. A. W. Lambert (8 Morgan runabout)
73. G. Brough (6 Brough)	137. E. Kickham (2 1/2 Douglas)
74. P. Rishy (6 Brough)	138. V. Wilberforce (8 G.W.K.)
75. G. E. Cuffie (7 Indian sc.)	139. G. W. Hiers (8-10 G.N.)
76. E. G. Webster (6 Zenith sc.)	140. Rev. E. P. Greenhill (8 G.W.K.)

101. A. V. Sumner (3 1/2 Day-Leeds)	
102. T. C. de la Hay (2 1/2 Sunbeam)	
103. F. W. Southern (2 1/2 Sunbeam)	
104. S. T. Tessier (6 Bat sc.)	
105. G. Featherstonhaugh (3 1/2 Rover)	
106. M. A. J. Orde (3 1/2 Rover)	

The Noble-Iddon Trophy will be awarded in this event. Entry forms can be obtained from Mr. E. L. Herring, The Gables, Pine Tree Glen, Bournemouth West.

## LONDON-GLOUCESTER TRIAL.

The North-West London M.C.C. open Gloucester trial for motor cycles, sidecars, and cycle cars, on Boxing Day, has attracted the following entries:

The start is at 7 a.m. prompt from Jack Straw's Castle. Entrants to be in position ready at 6.30 a.m. The distance is about 235 miles.

Mrs. Baxter (6 lady's model Rex)	P. A. Goddard (2 1/2 Douglas)
E. P. Baxter (6 Rex)	Claude Rose (7 Indian)
W. C. Knight (8 Zenith sc.)	H. E. Taylor (5-6 F.N. sc.)
W. Cooper (8 Hummerette)	Elswick Co. (Elswick)
H. P. S. Morgan (8 Morgan)	J. H. Jeffery (Whitgift cycle car)
R. Scott (3 1/2 Triumph)	Percy James (3 1/2 Triumph)
Frank Thomas (10 G.N.)	G. A. Strickland (3 1/2 Triumph)
Osmond Hill (8 G.N.)	G. L. Fletcher (2 1/2 Douglas)
G. J. Hardie (3 1/2 Triumph)	A. J. Dryden (3 1/2 Ariel)
C. W. Meredith (3 1/2 Bradbury sc.)	T. R. Brodie (3 1/2 B.S.A.)
R. G. Mundy (G.W.K.)	D. Popplewell (3 1/2 Rover)
J. Ocker (4 1/2 Singer sc.)	F. G. Boddington (8 Morgan)
J. R. O'Donovan (4 Singer sc.)	L. F. de Perecarre (8 Duo)
A. A. Brinkmann (5-6 Clyno sc.)	Cecil Peeds (2 1/2 Forward)
... O. Oldham (3 1/2 Bat)	Frank Smith (5-6 Clyno sc.)
... P. Gibbins (Rudge Multi)	F. C. White (3 1/2 Rudge)
Chas. Jamieson (Rudge Multi)	A. G. Barnes (6 A.C.)
J. Beal (6 1/2 N.S.U.)	H. G. Mundy (6 A.C.)
G. Nott (8 Matchless sc.)	L. Morridge (3 1/2 Mead)
E. Rose (7 Indian)	J. Ouphaunt (3 1/2 Premier sc.)
C. L. Mowbray (3 1/2 James sc.)	W. Edmonds (8 Hummerette)
W. Ford (—)	J. Bradford (5-6 Letheren cycle car)
H. J. Pooler (3 1/2 Premier)	W. V. Sherwell (8 Sherwyn)
V. Garland (5-6 Clyno sc.)	Glynn Rowden (2 1/2 Douglas)
C. A. Werner (6 1/2 N.S.U. sc.)	C. J. Burton (10 Mors car)

## AMONG THE ACCESSORIES.

### A True British Tyre.

John Bull Tourist Trophy weight cover.

The John Bull cross groove motor cycle tyre is a cover which has been greatly appreciated by motor cyclists during the year. On the stand of the Leicester Rubber Co. at the recent motor cycle show, covers were shown which had travelled 5,000, 6,000, and, in one case 11,000 miles, and yet were by no means worn out. It is interesting to recall to our readers the fact that Mr. Geo. Brough won the London to Edinburgh and back cup for the third time in succession on a machine shod with these tyres.

### Some Useful Tools.

Messrs. George Adams, 77-78, High Holborn, W.C., are selling many small tools which are of use to motor cyclists who spend some of their spare time in either doing their own repairs or improving their machines. Among these we may mention an auxiliary vice, which is designed to be held in the jaws of an ordinary vice. The clamping portion can be moved in any direction, and the little instrument allows small work to be easily filed up in any position while held in a vice. The Fit All pliers can, if desired, be carried in the tool bag. In one position they can be used as an ordinary pair

Vulcan combination tool.

of gas pliers, but by moving the fulcrum pin to another hole they can be adjusted to take a small nut. The Vulcan combination tool is fitted in a neat case, and comprises a spanner, split pin extractor, and hammer; the serrated portion in the centre is used as a pipe wrench, while the extremity forms a screwdriver and split pin spreader.

Hawk-eye motor cycle wrench.

Another useful tool is the Hawk-eye wrench, which can be used as a spanner in the manner indicated in the sketch or as a pipe wrench. In the centre is a screw plate for  $\frac{1}{2}$  in.,  $\frac{3}{4}$  in., and  $\frac{1}{2}$  in. threads; this is useful for restarting a screw thread on bolts, the threads of which have been damaged. The firm of George Adams supplies other interesting tools, but we have mentioned those which are of special utility to motor cyclists.

A suggestion in these columns has been adopted by the makers of the Ramsden sidecar, viz., to provide a convenient receptacle for parcels, which can be reached without disturbing the passenger. The back of the seat as will be seen, takes the place of a lid.

### New Belt Punch.

The makers of the Enots Lubricator, Benton and Stone, Ltd., Bracebridge Street, Birmingham, have just introduced a new belt punch for motor cycles, which is a neatly made tool which cuts a clean hole exactly in the right position, namely, in the centre of the belt. One punch will cut all sizes of belts from one inch downwards, there being four pairs of adjustable plates, which are hinged to the sides of the arch and by using the plates as packing a central position is assured for the belt.

### Pilot Jet.

The annexed illustration is that of a pilot jet or bypass, made by J. H. Wilkinson, 40, Jubilee Road, Doncaster. It is shown attached to the induction pipe of a twin-cylinder 5 h.p. T.T. Matchless.

Wilkinson Pilot jet.

Jap, on which it has been tested with the following results: Ten miles per hour slower speed than formerly; and five miles per hour higher speeds have been attained, and, we are told, double the distance per gallon of fuel has been covered. The device may be used as an

extra air inlet if desired, and is made suitable for handle-bar control. High speeds are attained by stopping up the main jet and opening out the bypass, using the throttle as an extra air opening. Varying sized choke tubes may be screwed in the end further to atomise the fuel if desired. This device will also atomise paraffin as well as petrol, and can be fitted to practically any type of motor cycle carburetter.

### Storage of Parts on Sidecar Bodies.

Accessible lockers on sidecar bodies are now becoming a feature. It will be remembered that *The Motor Cycle* recently drew attention to the inconvenience of being obliged to ask one's passenger to get out of the sidecar while the driver foraged for a tool in the space under the seat. Messrs. D. Ramsden and Co., 17, Great Ancoats Street, Manchester, who noticed our remarks, have sent us photographs of a body which has a locker behind the passenger's back, measuring 24 in. deep, 19 in. wide, and 7 in. between the backs. From the above dimensions it will be gathered that an ample-sized compartment for all ordinary tools is provided in a convenient space which is usually wasted.

### Waterproof Coats.

A useful double texture waterproof coat is being sold by the Eclipse Rubber Company, 85, Hatton Garden, E.C. It is shown in the accompanying illustration. The coat is lined with a detachable unstretchable fleece lining, provided with spring button fasteners. Wind cuffs and belt are included, and the length overall is forty inches; leg overalls are sold to match. A speciality is also made of a double breasted oil-skin coat, forty-two inches long; this has wind cuffs, a leather belt, and Raglan shaped shoulders. It is claimed to be absolutely impermeable to wet, and may be folded to a very small size.

Eclipse Rubber Co.'s waterproof coat with warm detachable lining.

Auxiliary vice by George Adams.

#### TIME TO LIGHT LAMPS.

Dec. 26th	...	4.53 p.m.
" 28th	...	4.55 p.m.
" 30th	...	4.57 p.m.
Jan. 1st	...	4.58 p.m.

#### Italian Team in T.T. Race.

We understand that it is extremely probable that a representative Italian team of three riders will enter the next T.T. Race, most likely in the Senior event.

#### Midland Cycle Car Trial.

The first cycle car trial last Saturday attracted fourteen entries; there were six three-wheeled machines—the A.C., Morgan, and P.M.C. Motorette—whilst the remainder were four-wheelers.

#### Spanish Motor Cycle Race.

A road race recently held in Spain over a course of 38½ miles in length, starting at Bilbao and finishing at the same place, resulted in a win for Don Gregorio Pradere, who rode a Rudge-Multi. The winner's time was 1h. 2m. 7s. Other machines ridden in the race were: F.E. and T.T. Triumphs, T.T. Rudge-Multi, and Peugeot.

#### A.C.F. and F.M.C.F.

From recent developments, we have every confidence in stating that the friction which has existed between the Auto Cycle Club de France and the Fédération Motorcyclistes de France will very soon be smoothed over and forgotten.

#### A.C.U. Notes.

THE AUTO-CYCLE UNION ANNUAL DINNER. The A.C.U. annual dinner will be held on a Friday evening early in February. INCREASE OF MEMBERSHIP.

The total increase of membership for the month amounts to 438, consisting of 312 touring members, 26 individual members, and 100 members of affiliated clubs. Nearly 300 members joined at Olympia, when 398 badges were sold.

#### THE 1913 A.C.U. LONG DISTANCE TRIAL.

Owing to the importance assumed by the 1913 International Reliability Trial, there is a distinct possibility of the joint A.C.U. and Scottish Trial being abandoned for next year. (Each, of course, will be held separately.) Instead, it is likely that the A.C.U. Six Days Trial will be held in September, and the International Reliability Trial will be held in conjunction with it.

#### SPECIAL FEATURES:

SEASONABLE STORIES AND ILLUSTRATIONS.

NEW RECORDS WITH STEEL CYLINDERS.

THE CHRISTMAS TRIALS.

List of Competitors.

A STEAM MOTOR BICYCLE.

#### A Steam Motor Bicycle.

Many references have been made in these columns to the possibilities of a steam motor cycle, and now such an attractive mount is an accomplished fact and has been ridden by one of *The Motor Cycle* staff. A detailed description of the machine appears in this issue.

#### Seasonable Articles.

This issue being on sale before Christmas, we have departed from our usual custom to find space for a selection of seasonable articles and a number of special illustrations. The lighter side of motor cycling will no doubt be appreciated by readers at this festive season.

#### Midland Open Trial.

The third open reliability trial of the Sutton Coldfield and Mid-Warwickshire A.C., for Saturday, February 15th, promises to be an important event. The two previous Colmore cup winners—W. D. South (Scott), in 1911 and F. Smith (Clyno) in 1912—will again compete.

With regard to the article published in our last issue, "Methods of Finding Winners in Reliability Trials," it is interesting to note that the Sutton Club particularly desires to select the winner of the Colmore cup without recourse to odd seconds in timekeeping, though, of course, the plan of not allowing more than a minute's margin at the various points will be retained, and rightly so. Perhaps some of our readers can offer suggestions for some better method of determining one winner from a number of non-stops. A new route has been chosen for the 1913 trial, via Warwick and Stratford to Cheltenham; parallel to this road runs the northern half of the Cotswolds, and sufficient tests for the machines will be found in climbing such hills as Saintbury, Willersey, Broadway, and Sudeley.

#### Number of Motor Cycles.

Our contemporary *The Car* repeats in the current issue the figures given in the books of the Registration Authorities throughout the Kingdom. The total number of motor cycles registered is 132,245, pleasure cars—175,247, commercial vehicles 12,627. When the above figures are compared with the returns made by the Local Taxation Authorities of machines on which taxes are paid, it will be seen that there is considerable divergence.

#### POSSIBLE SIDECAR DESIGNS FOR 1914 AND ONWARD.

"A HAPPY CHRISTMAS" TO OUR READERS ALL OVER THE WORLD.

### Frank Philipp's Progress.

We are pleased to say that Frank Philipp, who was injured in an accident on Yorkshire roads a few weeks before the Show, is going on very well. The process of recovery seems slow, but Philipp sustained severe injuries.

### Stolen Machines.

A three-speed 1912 2 h.p. Humber light-weight, registration BW 15, was stolen from Mr. F. Butler, 1, Townley Road, Dulwich, S.E., on the 16th inst. The thief is described as about 5ft. 6in. in height, dark and clean shaven, and gave the name of James Ward. £4 reward is offered for information which will lead to recovery of this machine.

### The Use of Benzole.

We have received some interesting reports lately on the use of benzole for motor cycle engines. Nearly all the users state that benzole gave more power, a greater mileage to the gallon, and less carbon deposit than petrol, provided precautions were taken to provide sufficient air and so ensure complete combustion. Often benzole can be used without the necessity for any special adjustment of the carburetter, but not infrequently the float requires to be weighted slightly with the aid of a washer, and more air must be given.

90% benzole is said to give better results than the pure spirit, while it is not generally known that unless it be mixed with a small percentage of another substance it freezes readily at 0° Centigrade. Benzole is about 4d. a gallon cheaper than petrol, but while the annual consumption of petrol is about sixty-two million gallons, the greatest possible output of benzole per annum in England would not probably amount to over twenty-three millions of gallons.

### French Motor Cyclists' Differences.

The want of adhesion between the Fédération des Motocyclistes de France and the Automobile Club of France is interesting to English motor cyclists, since any registered British rider wishing to compete in France cannot do so unless the competition be run under A.C.F. rules, owing to the joint understandings between the R.A.C., A.C.U., and A.C.F. Every effort is being made to bring about an agreement between the two dissentient parties.

We sincerely hope that these efforts will result in an amicable settlement.

While in Paris, M. Toulemonde (president of the Fédération) and M. Bonvard (of the Lyons M.C.C.) called on Messrs. Boileau and Loughborough, and put their case before them. The Fédération claims to be a body of sportsmen untrammelled by trade influence, and is anxious to come to an agreement with the ruling body whose authority it acknowledges.

Before leaving Paris, Mr. Boileau drafted a letter to the Chevalier René de Knyff clearly setting forth the constitution of the A.C.U. for the guidance of the Fédération delegates and the Commission Sportive of the A.C.F.

## FUTURE EVENTS

Dec. 26.—N.W. London M.C.C. Open Winter Run to Gloucester and Back.

1913.

Jan. .. —A.C.U. Open Silencer Trial.

" 18.—North Middlesex M.C.C. Open Trial.

" 18.—Bournemouth and District M.C.C. Reliability Trial.

Feb. 15.—Sutton Coldfield and Warwickshire A.C. One Day Trial.

### Three and Four Wheels.

Our attention has been drawn to a paragraph in *The Glasgow Herald* of December 10th under the heading "Motoring Notes." The contributor is Mr. A. N. Sinclair, and, writing about three-wheelers in competitions, he says: "The tricar has had a long enough innings for its shortcomings to become well known; it is but a compromise, a makeshift at the best, and should be excluded from such a contest, with a view to its suppression." This is not a fair criticism of such machines as the A.C. Sociable and the Morgan, and strikes us as being altogether too sweeping without being explanatory or authoritative. Three-wheelers have their drawbacks, but they have performed quite as creditably as, if not in a superior manner to, four-wheeled machines which have been in competitions this year. We see no reason why three-wheelers should be

barred; on the contrary we should advocate competition between the two types as a means of proving which is the better. Present proofs are by no means conclusive.

### Steel Cylinders on Motor Cycles.

Is it likely that steel cylinders will revolutionise track racing? We are inclining to such an opinion. Ever since we published the first mention that S. L. Bailey was using steel cylinders on his Douglas there has been considerable discussion in trade circles. This week we describe an attempt on world's records, when he accomplished nearly 73 m.p.h. on a 350 c.c. machine.

The subject of steel cylinders is of absorbing interest at the present time, and in our next issue we shall publish an informative article concerning the use of steel cylinders for motor cycles, by a well-known expert.

### A Two-seated Sidecar.

A sidecar attachment possessing the advantages that both driver and passenger sit side by side, and may also be protected from the elements by a hood and screen, is about to be placed on the market by Messrs. Lloyd, Dunn, and Co., of Redbourn, Herts. It is on the lines of the Davis-Double which was introduced a couple of years ago. The clutch and brake pedals are arranged inside the sidecar body, the carburetter control levers are mounted on the special handle-bar, and the valve lifter is attached to the seat-pillar for cooling the engine downhill. We have heard good accounts of the comfort and cleanliness of the machine, which will be adaptable to most makes of motor cycles.

A DOUBLE SEATED SIDECAR.

A patented sidecar attachment known as the U & L, made by Messrs. Lloyd, Dunn & Co., of Redbourn, Herts. It will be placed on the market in the course of a few weeks. (See paragraph above).

# A STEAM MOTOR BICYCLE.

A NEW AND PRACTICAL DESIGN BY STEAM CAR MANUFACTURERS.

Complete view of the Pearson-Cox steam motor bicycle.

A. Water tank. B. Paraffin tank. C. Steam release valve. C'. Steam release valve lever. D. Generator or boiler. D'. Water control valve lever. E. Steam pipe.

**W**E have referred previously to the possibilities of the steam motor bicycle, and in 1909 published a description and photographs of a steam sidecar machine, which was actually in use for some little time.

It is now our pleasure to make the announcement that Messrs. Pearson and Cox, Ltd., Shortlands, Kent, who are manufacturers of light steam cars, have been giving considerable attention to the question of propelling a motor bicycle by a steam engine. They have been experimenting for about two years, and have evolved the machine which is the subject of this article.

The illustration of the complete motor bicycle shows it to be fairly neat and by no means displeasing to the eye.

The engine is set in the old Ormonde position behind the saddle tube, and the diamond frame is taken up by the water tank, while fitted transversely across the forward ends above the footboards is the generator or boiler. The engine has a single acting cylinder, and develops 3 h.p., with a bore of  $1\frac{3}{4}$  in. and stroke of 2 in. A single acting engine is the most simple type, and dispenses with the need for glands and packing. There are very few parts, which are as follows: Cylinder, piston, flywheels, connecting rod, crankshaft, two mushroom valves, and a simple type of plunger pump, worked by an eccentric off the crankshaft. The valves are operated by means of cams and rockers, the cams being keyed one to each side of the crankshaft. The valves have a lift of  $3\frac{3}{32}$  in. and rarely need attention. The feed water pump is of the vertical plunger type, having double suction and delivery valves. The generator burner is of the

horizontal Bunsen type, practically noiseless, and burning paraffin; it is fitted with a hand operated valve for reducing the flame when the machine is at rest.

## Starting from Cold.

In the present model the starting is somewhat crude and takes about ten minutes, but in the new type a small spirit lamp will allow the main burner to be lighted within five minutes. The generator consists of horizontal layers of specially drawn weldless steel tube, the various layers forming four sections, which are coupled together by means of unions placed outside the rectangular casing. A section, therefore, can be replaced with ease if one be damaged. It is impossible for the generator to explode, owing to the small quantity of water and steam at any time in the generator and to the extremely strong form of construction afforded by the small bore tubing, which will withstand a pressure of 7,000 lbs. to the square inch, although the actual working pressure varies between 100 lbs. and 500 lbs. to the square inch.

## Transmission.

The drive from engine to the back wheel is by a single chain, and the gear ratio is  $3\frac{1}{2}$  to 1. The inner flange of the large chain wheel acts as a bearing surface for the internal expanding rear brake.

On the occasion of our visit to Messrs. Pearson and Cox's works we were interested to see the machine started up from cold. In the first place, a small quantity of methylated spirit was poured into a trough running round the burner soaking several wicks and then lighted. After about ten minutes sufficient heat was obtained to allow the paraffin carried in the tank behind the saddle to be turned on, while pressure was

## A Steam Motor Bicycle.—

The control arrangements.

- C. Steam release valve lever. D. Water control valve lever.  
I. Paraffin pressure gauge. J. Steam pressure gauge.

obtained by means of a hand pump fitted to the off-side of the machine, until the gauge in the pressure tank on the near side showed a pressure of 30 lbs. to the square inch. The paraffin vapour valve was then opened and the burner lighted.

As the engine is of the single-acting type, and depends upon its own pump for delivering water into the generator, it is not self-starting, and, in consequence, the machine must be walked for a yard or two before it will start. On the stand it is only necessary to pull up the back wheel slowly once or twice.

**Control and Running.**

At this stage we must say a few words concerning the control, which is of the simplest possible nature. Adjacent to the offside handle-bar grip is a lever controlling the quantity of water supplied to the generator, and close to the near side handle-bar grip is a Bowden lever, which, when raised, closes the steam release, to which we shall refer later.

To start the engine the feed water control is opened to its full or nearly fullest extent, and after the back wheel has been turned round the engine will start slowly at first and then rapidly accelerate. The water control lever is then adjusted till the machine assumes a speed of twenty-five or thirty miles an hour, and then left in this position. This position of the

water lever provides ample reserve for hill-climbing, or for a short burst of speed. To stop the machine it is only necessary to let down the steam release valve lever on the near side, which instantly allows any steam there may be in the generator to pass into the water tank.

We were allowed to take the machine to the nearest hill, and found it very easy to control and start, and capable of extreme flexibility, so much so that it could be turned round in the ordinary suburban road without the rider dismounting and with the engine "firing" at every stroke.

On the hill, which was approached at a particularly slow speed owing to the appalling nature of the surface, as soon as the water control lever was opened the engine took hold and brought us to the top at a very smart pace, easily beating as regards acceleration a well-known machine with  $3\frac{1}{2}$  h.p. petrol engine which was following. Naturally, this brief trial was totally insufficient to give any idea of the capabilities of the machine during an extended run, but we hope to have an opportunity for a longer trial at no very distant date. The machine we tried is absolutely the first of its type, and a few further points concerning it may be of interest

**Exhaust.**

The moment the water reaches the generator it is flashed into steam, and passes through the steam pipe (the lagged tube shown in the illustration of the complete machine) to the cylinder. After having done its work the steam enters the exhaust pipe and passes through two tubes on either side of the generator casing, on the lower portion of which holes are bored. The exhaust steam is, therefore, able to get rid of the by-products of the burner by creating a down draught, and it issues from the pipes in an invisible form, owing to its high temperature.

Although only of the single-acting type, the engine has a considerable advantage over the four-cycle petrol motor, as the piston receives an impulse every down stroke. As the hand control is entirely on the quantity of steam the boiler is allowed to generate, it will be

Elevation and plan views of the new Pearson-Cox steamer. The engine, it will be observed, is placed vertically and slightly lower than in the experimental model.

### A Steam Motor Bicycle.—

seen that, by turning on the full supply of water, the steam pressure is immediately raised, and the engine will develop its full power on a steep hill, even if travelling very slowly; in consequence no change speed gear is necessary.

Owing to the fact, however, that the engine is not self-starting, a plate clutch in the hub would, perhaps, be desirable, or self-starting could be obtained by the use of a hand pump to inject water into the generator tubes.

The advantages claimed by its makers are silence, smoothness of running, great flexibility, and wonderful hill-climbing power.

### Modifications on the New Model.

The present type carries sufficient petrol and water for about forty miles, but the new model will have a stroke of 2 in. in place of 2 in., a new type of generator (the burner of which can be started in about five minutes) and larger water and paraffin tanks.

The line elevation on previous page shows how the latest model will look when finished, and we certainly think readers will agree that the design is very neat and symmetrical. On the new model the water and fuel capacity will be sufficient for seventy miles, and the fuel will cost about 4d. a gallon. Whereas the experimental machine weighs 145 lbs., the new one will weigh 150 lbs. Engine lubrication is by crank case splash, a hand pump being situated on the forward

part of the tank, from which a charge of air-cooled or special steam oil must be injected every nine miles. The maximum speed on the road is between forty and forty-five miles an hour—surely sufficient for reasonably-minded tourists.

The power unit.

A. Paraffin tap.  
D. Water control valve.

F. Double-acting water pump.  
H. Exhaust pipe.

## YE FEAST OF THE T.T.

And there had been many wet days in the land.  
And it came to pass that the Feast of the T.T. drew nigh,  
and the Masters which are called Manufacturers did  
murmur and say unto each other,  
Behold, on the morrow shall our six-speed model wipe from  
the face of the earth all manner of change-speed  
devices.  
And it came to pass that on the day, Monday, the people  
who had travelled from afar did rejoice and say,  
We will arise and congregate about the banner of Start.  
And, notwithstanding the early hour, a great multitude had  
assembled together to behold the start.  
And one Ebbelwhite did lift his voice and say "Go," upon  
which James, who is surnamed Haswell, did gather  
his girdle about his loins.  
And James, who is surnamed Haswell, hastening into his  
saddle did wend his way amidst an exceeding great  
noise and dust.  
And on the tenth hour it became monotonous, inasmuch  
that we said one to another, Let us remount and depart  
unto Mount Snaefell;  
For it is written in the book *The Motor Cycle*, He who abides  
at the Mount shall find his reward.  
So we arose and smote (two strokes) the throttles of our  
asses, which are called Scotts, and did ride exceeding  
fast nigh unto "blinding."  
And behold we came unto the Temple of Bungalow;  
And being athirst we lifted up our voices and cried, Give  
us of the waters of Soda and Whisky.  
Having satisfied our thirst we assembled together on the  
brow of the Mount.  
And it came to pass that we did hear from afar an exceeding  
loud noise like unto the roar of the sea and wind.  
And behold one C. R. Collier, son of H. H.  
Collier, flashed o'er the brow on his mount,  
which by the prophets is called Matchless.

Then came one Frank, who is surnamed Applebee, riding  
nigh on to the wayside;  
And he also was exceeding fast—  
Yea, verily, inasmuch that we were afraid.  
And many riders flashed by on their iron mounts—verily, a  
pleasing sight—  
And our spirits ran high.  
But lo! from afar off came the noise which is called mis-  
firing,  
And we lifted up our eyes and beheld one coming slow, inso-  
much that he wobbled:  
His spirit was low, yea very low.  
Now at the twelfth hour the multitude were an hungered,  
and the men folk did fetch from their tents, called  
sidecars and carriers, loaves of bread, and small  
bottles;  
And many were the longing glances of those called com-  
petitors at our pitchers of Waters of Bass.  
And it came to pass that we did again remount, and rode  
unto the city of Douglas, even unto the foot of Bray  
Hill, whence cometh many people.  
And we did inspect the machines, from the 1,000 c.c.  
racer to ye olde corks.  
Then did we say one to another, Let us back to our tents  
or the temples will be closed, for the hour is late.

—NOB WARD.

# A Pretty Pickle. By X.Y.Z.

**C**HRISTMAS is always a festive season with me. I am one of those old-fashioned individuals for whom romps and puddings and crackers and waits never stale; and like most outdoor men I find the long autumn's grind in a City office particularly trying. With a grey blanket of fog hanging permanently over streets filmed with the greasiest slime, and fifteen miles of traffic and tramlines barring one off from the open road in every direction, there is small temptation for a Cockney who lives and works in the heart of London to take out his motor cycle between September and Yuletide. I am usually in high spirits when August comes round, but as Christmas closes down on me I get positively humpy.

This year I don't mind admitting I was more than usually above myself as the winter holiday approached. I once fancied that nothing had such power to enthuse me as a new overhead-valved engine with ramshorn handle-bars and the exhaust of a Mauser rifle, but I'd changed my views last August. You see, I met Mabel! She was staying with an old college pal of mine, who offered to put me up for a night when I was touring the Highlands, and though I was riding a brand new machine with a three-speed hub, she put it clean out of my head.

## Precipitous Mountain Climbs Forgotten.

I planned to spend one night at McDermott's with the idea of climbing three or four bouldery caterawls on the back side of the stupendous crag that overhangs his ancestral castle. But when I got home and wrote up my mileage log I found I'd stayed a whole week, and that the precipitous hairpins on that mountain side were still virgin soil so far as motor bicycles were concerned. In fact, I believe I should have been there yet, only unfortunately she had to come south after a week to nurse a sick aunt or something.

She was one of those rare girls who remind you of a 350 c.c. twin in perfect tune. Lots of go, never a misfire, full of surprises. Danced like an angel, sang like a nightingale, eyes that went right through you and gave you a sort of thrill every time she looked at you. Genuine thoroughbred, 80 mm. waist, or thereabouts, hung on springs—oh, she got me all the way.

But there was a miserable little rotter staying up there—fellow called Askew—he'd been there a month, and he sat in her pocket right up to the last lap. I could see she didn't fancy him particularly, but he sort of hung on to her back wheel, and it didn't matter how much throttle I put on, I never really left him.

Well, before she left she let out that she had a brother in a Mincing Lane shipping office, with whom our firm do good business, and you bet I spent that autumn making good with him. Couldn't tell you how many dinners and halls I stood him, and the result at last was an invite to spend Christmas up at their place near Thirsk.

I laid my plans well.

## I Went in for a Cycle Car.

It went against the grain to sell my motor bicycle, but her brother Geoffrey, let out that Askew was coming too. Now Askew, as I've pointed out, behaved as if she were a motor bicycle and he were a sidecar—permanently attached type—and I thought a cycle car was the one chance of an occasional *tête-à-tête* with Mabel. So I traded off the bicycle for a sort of tandem spider quad, or cycle car as it is called now. If I'd waited for the Show I should have laid in one of the new small car breed, with two seats side by side, and a hood and screen. As it was, I fixed on this tandem.

They're not half bad; you can put a big suit case in the front seat, and it doesn't keep banging you, as it would on one broad seat. I put on my oldest clothes, with a couple of sweaters under my jacket, and a huge oilskin and sou'-wester in case it rained. Then a few days ago I cleared town, and headed the narrow beak of my new four-wheeler dead north. I had some beautiful skids out Barnet way. Never knew these light four-wheelers pirouetted before, but you can take it from me they aren't jam with narrow smooth tyres on a greasy tramline junction. And you're so helpless—you can only sit there and look amiable, while your little coffin on wheels bounces from one motor 'bus to another. I registered a vow to fit steel studs before I started back.

## On Dick Turpin's Highway.

Once clear of the tramlines and traffic I got along faster than I should have done on two wheels, and by the time I was North of Stamford I was thoroughly enjoying myself. A cycle car doesn't steer so trickily in thick mud as a bike does, and as my seat was made of a broad piece of webbing slung between two steel crosspieces, it didn't bump like a motor bicycle does, while the dash comes up nearly breast high, and the engine diffuses a grateful warmth along the lower regions, so that only your nose gets really cold. Moreover, the tandem type causes little wind resistance, and the new 90° 10 h.p. engines run like oiled silk. I buzzed along a bit with the roads like a mixture of porridge and isinglass. Then came my Chatalja (hope that's spelt right—I'm better up in French motor lists than war maps).

I was spinning along just north of Newark when I saw a big Daimler limousine standing by the roadside with the bonnet off. Three men were playing about with spanners and monkeying round the engine in an amateurish sort of way, and through the misty windows I caught a glimpse of dark eyes and beauty in the cosy glass drawing room behind. One of the fellows held up his hand as I shot alongside. He was a Frenchified sort of Johnnie with a trim little black moustache.

"Excuse my stopping you, sir," he said very politely, "we are in a frightful hole. Can you give us any assistance?" I unsheathed myself—that's the

### A Pretty Pickle.—

only word which describes drawing oneself out of a coffin tandem when one's swathed in wraps. The girl opened the door of the big car and stood on the step, eyeing the congealed mud on the road with evident disgust. He went on:

### A Damsel in Distress.

"This lady, Miss Carstairs" (we bowed) "was telegraphed for early this morning to York, where her father has suddenly been taken dangerously ill. Our ignition has given out—I'm afraid there's a short circuit somewhere in the armature of the magneto. Your little machine looks very speedy. I wonder if you will waive the conventions and convey her to Doncaster, where she can catch the afternoon express? Some hours must elapse before we can obtain another car, and in any case she is not inclined to trust so urgent a matter to a motor after this disheartening *contretemps*." Wherewith he waved contemptuously at his magnificent car.

"Spinning along just north of Newark, I saw a big Daimler limousine standing by the roadside."

I thought a moment. Doncaster was on my road. The job entailed no delay for me, and the girl was indeniably pretty.

"By all means," I said heartily. "My name is Frank Griffiths, and I am going through to beyond Thirsk. I shall be only too pleased to be of service. Can I send a car out from Retford for the rest of you?"

He refused the suggestion, saying they knew some people who owned a car and lived a few miles away, and they would get a cyclist to take a message. The

men joined in thanking me, and prepared to ensconce Miss Carstairs in my front seat.

There was one obvious snag—she was dressed in an ordinary morning costume, which might be comfortable enough in a heated limousine, but was scarcely suited to the open front seat of a tandem cycle car. However, she rapidly removed her smart toque, one of the men produced a woollen arctic helmet, and helped her into his big frieze leather-lined ulster. Then he lifted her bodily off the car step to pack her into my front seat, when my suit case caught his eye. He looked enquiringly at me.

"May we put this on the train for you?" he enquired. I consented readily enough, but was rather piqued when they put her dressing case on her knees without a by your leave. One of them started my engine, and we shot off.

### Comforted and Reassured.

I made a few enquiries about her father, which she answered. He was a retired general, and had succumbed to a stroke—his second—and she was evidently consumed with anxiety lest she should not find him alive. I comforted her by tales of an imaginary uncle of mine, who after his sixth stroke could still play golf in all weathers.

She cheered up a little, and chatted quite pleasantly from time to time. It was curious to see how the arctic helmet and ulster transformed a slim, pretty girl into the semblance of a burly man.

We soon ran into Retford. Here I stopped to get petrol, and noticed to my disgust that the near-side belt had dropped off somewhere; that's the worst of these solid axles—one belt disappears and the other keeps on driving, and you never know. I hadn't a spare, and the garage people had only got  $\frac{7}{8}$ in. in stock, whereas nothing under  $1\frac{1}{8}$ in. is any good for cycle cars. They sent a man off to procure a bigger size, and I coaxed my *protégée* into a neighbouring hotel.

As I lifted the suit case off her knees I was struck by its tremendous weight—I fairly had to heave to shift it. She noticed my surprise: "Silly things, these fitted dressing cases," she said pettishly.

I got her into the hotel, and when she pulled off her gloves I saw she was trembling with cold. So I paternally ordered half a bottle of Heidsieck. She removed the hideous helmet, and I saw she was a real scorcher; in fact, she was the trickiest looking girl I ever saw. The champagne put a sparkling colour into her cheeks, and I was just feeling quite proud of escorting such a stunner, when

### There came a Horrid Blow.

A biggish car had just stopped to replenish at the garage, and who should come into the lounge but

**A Pretty Pickle.—**

Askew with two other fellows! He gave my companion one quick glance, and then pretending not to recognise me, whispered something to his companions, and went out quickly. The car swept off in a moment, and cold shivers went through me. I could see a pretty garbled version of the incident going round the dinner table that night at Thirsk, and Mabel would have a pump-assisted, Alpine-sized radiator welcome waiting for me. I vowed never again to succour charming damsels in distress. A pair of new 1½in. belts arrived at that moment, and I took the road again feeling rather anxious and discomfited.

The champagne seemed to have caused oblivion of her parent's mournful condition in my companion's breast, and she grew quite arch; in fact, she told me a few stories which would have done with a little fan cooling. I was not half sorry when we got to Doncaster and I unloaded her at the station, dressing case and all; the station constable assisted her to carry the thing into the booking office. I thanked my stars I was rid of her, and divided my attention for the rest of the way between keeping the car on the road in the dark, and deciding how I could carry off the matter with a high hand at Thirsk, and thaw the icy reception likely to be prepared when Askew had described his view of me drinking champagne in a public lounge with a rather fast-looking girl.

To cut a long story short, I arrived at Mabel's home about 11 p.m. half dead with cold. The butler met me on the step, and in response to my enquiries informed me that my suit case had not arrived! They were having an impromptu dance, and there was I with stained and musty tweeds for my only wear.

He suggested a hot bath, a little supper in my room, and bed; probably my clothes would arrive before breakfast next morning. Yes, Mr. Askew had got in just after dinner, and was dancing. I did not feel like removing false impressions in my present garb, and I followed the worthy butler's advice. I was not exactly looking forward to next morning, but to tell the truth I was so tired after my long drive that I had no difficulty in going to sleep, and I don't remember any dreams.

**Arrested for Burglary.**

When I first awoke, I thought it was a nightmare. A gigantic policeman was standing by the bedside, with another bigger brute in blue behind him; Mabel's brother and father and that swine Askew were in the background, while some of the servants, looking very excited, were craning their rubber-necks round the edge of the door. As I stared in amazement, the sergeant said: "I'll trouble you to come along with me, sir; I have a warrant for your arrest on the charge of being concerned in the big jewel robbery at Sheffield yesterday!"

Protestations were useless. The family were plainly convinced of my guilt. The police cleared the room, helped me into my fusty old tweeds, handcuffed me, and marched me out down the big staircase and across the hall into a cab.

Talk about running the gauntlet; all the guests—many of them pretty girls I didn't know—were waiting there to peep at the monster, and Mabel among them, with her arm through Askew's, who was smiling his slimy "knew-he-was-a-rotter" kind of grin.

During the four miles' drive into Morpeth I astonished the police by my language, and they told me that the news of "my burglary" had been wired to all the adjacent railway stations, as the Sheffield police thought I should strike for town; that by a gorgeous fluke the railway police at Doncaster noticed the weight of my companion's handbag; that they hadn't sufficient proof to delay her, but noticing she had booked to Hull, they had wired there, and she was taken just as she was boarding the steamer; that they wired up the road and traced me by my registration number; that they expected there'd have been a few jewels missing round Thirsk before the New Year if they hadn't collared me; and they concluded by beseeching me to own up like a man, and say whether "my gang" had worked the dozen successful jewel raids of the past twelve months, and by prophesying that if I turned King's evidence I should get off with fifteen years?

By the time we reached Thirsk Police Station my brain had cleared a trifle. The top dog in blue there had a head on his shoulders. I produced my papers, told him my story, and got him to wire to my governor at our London office. Half a dozen wires proved that I'd been in London when the Sheffield crib was cracked, and inside four hours I was released with a thousand apologies, and tooled back to Mabel in the Chief Constable's own car.

**The Thieves got away after all.**

I found my suit case had arrived—so the thieves were not quite devoid of decency. It came by rail from town, and the police said the Daimler had been stolen from a private garage at Sheffield; it was found hidden in a wood a few miles from Grantham in perfect running order, its occupants having evidently walked into the station, and trained south. They got away to the Continent comfortably, and simply unloaded that girl on me because they thought it safer to divide forces, and to send the swag off *via* Hull.

Mabel soon consoled me. Askew wasn't exactly popular among that house party; he'd been bragging all morning that he was the only one to see through me. I danced six waltzes with Mabel that night, and I don't mind telling you that for certain reasons I shall never own another motor bicycle, and that my next cycle car will have side by side seats.

Mabel says the one I've got would be all right if I were a little nearer to her.

Single-cylinder water-cooled engine of the Barimar four-wheeler, sold by Barimar, Ltd.

# THE INTEREST IN RUNABOUTS.

By B. H. DAVIES.

IT will be very interesting to watch the development of cycle cars during the next two years. In one respect, and in one only, the circumstances are identical with the premature tricar boom of 1905-6, which ended so disastrously in the extinction of a new type. The public were clamouring for a new brand of light passenger-carrying vehicle, in which one or two makers had achieved some small success during the previous autumn. As a consequence hosts of mushroom firms sprang into existence, marketed untried designs, and left the public to perform the experimenting which ought to have been done secretly by designers and makers during the preceding year. The results were catastrophic. Delivery was difficult to obtain during the next spring, as manufacturers realised their new designs were not roadworthy, and the breathlessly-made contracts for material and provisions for construction fell into hopeless confusion. Buyers who obtained delivery encountered heart-breaking experiences on the road. Within twelve months the tricar was almost as dead as the dodo, and the passenger-carrying department of the industry received a staggering blow, from which it has yet to recover. The prejudice thus created still survives, and considerably hampers the path of firms who make infinitely superior tricars to-day. Beyond contradiction this element of unpreparedness figures in the present situation. Twelve months ago, six months ago, yes, even twelve weeks ago, many firms now posing as cyclecar manufacturers had never dreamt of manufacturing a passenger vehicle other than sidecar outfits. The last time the trade was taken by storm in this fashion the effects were duplex. Delivery was delayed until far on in the ensuing season, and when machines were delivered they were grossly unsatisfactory. The interest of 1913 will consist in watching how far history repeats itself.

## Disappointments in Delivery.

I am quite certain the 1905-6 *débâcle* will not be repeated *in toto*. Cycle cars will not die out; they have come to stop. I find grounds for confidence in the fact that perhaps half-a-dozen makes are already established; they have won their spurs in many a fierce test, and they are already manufactured on a commercial basis. If all the newcomers were failures, the pioneers are sufficiently numerous and sufficiently honest to create a lasting demand. After this preface to prophecy, we may go a step further and admit that delays and disappointments in delivery are likely to be a trouble next spring. The industry is much better organised than it used to be, and the purveyors of parts and material are in a more established position, while a number of firms have laid their plans in statesmanlike fashion. Nevertheless the last-minute advent of perhaps fifty firms into a new branch of the industry must imply much congestion and confusion between now and Easter. Such delays will, however, be limited to a minority, and will only be temporary.

Retracing past history, we remember that the prematurely-introduced tricars were slain by bad ignition, bad carburettors, bad engines, shoddy water-cooling devices, bad brakes, bad clutches, bad springing, light tyres, and details connected with three-wheel design. Of these counts in the indictment, the cycle car need

only be afraid of bad springing. The all but perfect ignition, carburation, engines, cooling, brakes, and clutches can be transferred with only detail alterations to a cycle car chassis; and there is no reason for supposing that detail troubles of these kinds need be anticipated. As most cycle cars are four-wheelers, tyre troubles need not be feared. Similar engines have transmitted their power for years past through a single  $2\frac{1}{4}$  or  $2\frac{1}{2}$  in. tyre, and the addition of an extra driving wheel should improve the tyre question; if any makers underyre their cycle cars, it should only be necessary to fit an "extra fort" cover on the existing rims.

## The Problem of Springing.

Springing is, however, sure to cause much heart-burning, especially on cycle cars fitted with vibratory engines and no by-pass jet. The engine of a cycle car must often be left running with the vehicle stationary; and we know how we get shaken when we run a motor bicycle engine free; the same engine will shake more when it is mounted on a light spidery four-wheeled chassis. The 90° engine and pilot jet carburettor will soon reduce engine vibration to negligible limits. Road vibration still remains to be reckoned with, and will take much more killing. Men accustomed to speedy bicycles will not be satisfied with a cycle car which cannot touch 40 m.p.h. at a pinch, and a smooth-running vehicle, weighing from 3-7 cwt., and capable of the speed mentioned, will not hold the road if it is sprung as simply and crudely as many designs which I have seen. This is going to be the real crux of the cycle car movement, as long-distance drivers who purchase some of the experimental models will rapidly realise. A London-Edinburgh trial on sundry models will be exhausting for men, and injurious to their fair passengers. For the rest there need be no anxieties. The chassis problems are the same problems which automobile engineers have long since solved, only they are now to be viewed through the wrong end of a field-glass. Some of them—*e.g.*, silence and steering—may require more attention than they have yet received, but outside the springing there is nothing to be anxious about.

## Sidecar or Cycle Car.

I imagine that many a cautious buyer, particularly if his purse be shallow, will remain faithful to the sidecar for a time, and that by Olympia, 1914, the boom in cycle cars should touch its zenith. In the interim the carelessly-planned and made vehicles will gracefully retire from the unequal struggle; the trade will concentrate into fewer hands; and the survivors will be ready to manufacture on a large scale. If I were purchasing a cycle car this week, I should inspect every detail very closely, and I should select a firm with a well-known reputation for good workmanship. Having made my choice I should insist on a prolonged road trial, and I should steer the machine over the worst roads I could find, for I remember that many a £400 car, with a ton to glue it on the road, and long springs and rebound snubbers, is excessively uncomfortable on bad roads; and I should realise that a vehicle at a quarter the weight, with very elementary springing, is likely to be even more kangarooish in its progress.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

#### Age Limit for Tricar Driving.

As I am thinking of purchasing a tricar, I should like to know whether a boy of sixteen would be allowed to drive a three-wheeler.—C.J.P.

A boy of sixteen would not be allowed to drive a three-wheeler if it were sufficiently heavy to necessitate it being registered as a motor car; that is to say, over 3 cwt. unladen. Seventeen years is the minimum.

#### Silencer Frames.

(1.) What advantages has the dropped frame chassis got over the ordinary, especially as to springing, comfort, safety, and easy running? (2.) Do you consider the arrangement of cantilever springs better as regards comfort in springing and durability than the C springs? (3.) Can I rely in safety on three-point couplings when using a well-known make, passenger's weight not to exceed 12 stones?—G.B.S.

(1.) The dropped frame chassis gives a lower position to the body, with ample room for the springs. (2.) C springs with shackles are quite as comfortable as any other method. (3.) Three-point couplings constructed by well-known makers are quite safe, but four are better.

#### Making an Engine Reverse.

I shall be much obliged if you will let me know (1) if it is a difficult matter to reverse an ordinary single-cylinder motor cycle engine, and (2) if it is possible, what alterations are to be made to the timing of the valve cams and ignition?—W.E.B.

(1.) Whether it is a difficult matter to reverse a motor cycle engine would depend largely on details, such as whether the inlet valve was mechanically or automatically operated; if the latter, whether the inlet cam was formed in one with the same camshaft as that carrying the exhaust cam; whether the engine cylinder was off set, and whether finger levers were interposed between the cam face and the valve tappet; but, in any case, if an engine is designed to run in a given direction, it is not advisable to alter it. (2.) The alterations necessary to the valve setting, and possibly to the cam contours, would best be discovered by making a diagram of the valve working, and the valves and ignition must be re-timed. If you cannot do this—and you must reverse the running—put the matter in the hands of a really good engineer.

#### Silencer Regulations.

Would you please inform me whether there are any specified requirements in regard to the silencer of a motor cycle under the new Act re cut-outs? My machine is at present very noisy without a cut-out, and I want to experiment with a silencer of my own design.—E.P.L.

The new regulations, which come into force on March 1st, require that there must be no outlet for the exhaust before the latter passes through an expansion chamber. On the other hand, even if an expansion chamber be fitted, the police will have the power to stop a machine which causes a nuisance by making too much noise.

#### Newport (Mon.) to London.

Will you kindly give me the route from Newport (Mon.) to London?—W.E.

There are two ways of reaching London from Newport. Probably the better way is to go by road to Severn Tunnel Junction and take the machine by train as far as Pilning; then make your way through Filton, Mangotsfield, Marshfield, Chippenham, Marlborough, Hungerford, Reading, Slough, Hounslow, to London. Or you can make your way through Chenstow, Lydney, Newnham, Gloucester, Cirencester, Fairford, Lechlade, Wantage, Wallingford, Nettlebed, Henley, Maidenhead, Slough, Hounslow, to London. The first-named route is very much shorter.

#### Extra Air Intake.

I should be pleased to have your opinion on the subjects below.

(1.) Does the fitting of a Bowden extra air intake, on the induction pipe between engine and carburettor, contribute towards (a) economy in petrol, (b) speed, and (c) general efficiency? (2.) Does it not lessen the suction on the jet, and at the same time detract from the correctness (if I may so term it) of the mixture? (3.) Is the practice of giving overlap more general than not giving it, and what is the usual amount allowed on engines so built?—MECHANIC.

(1.) All the items mentioned depend upon the general adjustment of the carburettor. If the carburettor is right, an extra air inlet will not materially improve the running. If, however, it is adjusted distinctly on the strong side, an extra air inlet would greatly tend to

economy and might improve the speed a little. (2.) The only way in which the device could detract from the correctness of the mixture would be if it leaked at all when fixed, or were wrongly used. (3.) The practice of giving overlap on valves is somewhat on the increase in motor cycle engines, but, on the whole, we should say that the "no overlap" setting is the more general. Overlap from three to five degrees may be allowed.

#### Sidcar Axles.

(1.) What sort of steel is it advisable to make sidcar axles of—mild forged steel, cast steel, or would tool steel be good if left in a soft state? (2.) Are the cones case hardened or hardened and tempered right through? (3.) The broken axle is  $\frac{3}{4}$  in. diameter (but had a bad flaw in it). I can increase the diameter of new one to  $\frac{7}{8}$  in. Provided there was no flaw anywhere in the metal, do you think this would be absolutely proof against another similar breakage in the future? Can you give me the size of axles generally fitted to the heavy coach-built sidcars, say, Milford's or Montgomery's? (4.) Re tyre wheel rims, which is the best size (diameter) of rim to order? I have enquired of several different tyre firms and each one appears to differ slightly from the others. 22 $\frac{1}{2}$ , 22 $\frac{3}{4}$ , 22 $\frac{5}{8}$ , 22 $\frac{3}{4}$ , have been some of the answers received. Which do you think advisable? I do not always use the same firm's covers.—H.P.H.

(1.) For sidcar axles we would recommend a mild steel of 30 or 35 tons tensile; tool steel, even if annealed, would not be suitable. (2.) In some of the cheaper work cones are of mild steel case hardened, but in best work they are of crucible steel, hardened and ground. This latter process you might find difficult. We believe several steel makers produce a steel for cones, which can be used unhardened just as it is machined. (3.) It is impossible to say whether the axle would be absolutely proof against a similar accident in the future without seeing its design; probably you would be the best judge if you bear in mind that the increased diameter from  $\frac{3}{4}$  to  $\frac{7}{8}$  of an inch ought, on the sectional area, to increase the strength 50%. Do you mean the spindle inside the hub or the part outside the wheel? (4.) We should advise you to order a standard rim specifying at the time the size of the tyre you intend to use.

### Portsmouth to Eastbourne.

**?** Is it possible to go by cycle car from Portsmouth to Eastbourne, avoiding Brighton and its tramlines?—R.G.

We suggest *via* Portsmouth, Cosham, Havant, Chichester, Arundel, Worthing, to Shoreham. Here turn left and take the old road to Brighton, which avoids the town altogether, and misses all the tramlines where traffic is likely to give trouble. Then continue through Lewes and Wilmington to Eastbourne.

### Two-stroke v. Four-stroke.

**?** I have never yet ridden a motor cycle, but hope to take up the sport at an early date. While at the Show recently I was very much struck with the simplicity of the two-stroke engine, and as an entire novice I shall be much obliged for your opinion on the following points: (1.) Is there not a greater possibility of gas escape in the two-stroke type, and do you consider this

danger adequately overcome by the device adopted in the Connaught machine? (2.) Is there not a greater liability to overheat? (3.) Do you consider the method of lubrication in use on the Connaught engine a thoroughly effective one? Is it not likely to cause carburettor trouble? (4.) From your experience, is the two-stroke engine likely to give as much satisfaction, as regards economical working, durability, and power, as the ordinary type of motor?—A.S.W.

(1.) One difficulty with a two-stroke is loss of crank case compression, but this does not occur until bearings are worn badly. (2.) There is a slightly greater tendency to overheat. (3.) The lubrication in use on this machine has been thoroughly tried. (4.) The two-stroke engine is not so economical as the four-stroke, but many two-stroke engines are now giving the greatest possible satisfaction, due to simplicity, durability, and evenness of torque, and a two-stroke Scott won the Senior T.T. Race.

### Steel Bushes.

**?** I have had a J.A.P. engine for about twelve months, and have ridden something like 1,300 miles. I find that a new bush is required for pulley side.

On examining the bush it seemed to be as much hammered as worn, as there is quite a rough edge on the outside of the bottom. To obviate the trouble of having to rebush so often, I am ordering a hardened steel bush, which I purpose fitting, and write to ask your opinion on the matter. The J.A.P. people in their specification say that the spindles are hardened.—J.H.

There is no reason why you should not use a hardened steel bush to work against a hardened steel spindle, but you will have to be very careful in fitting it, to see that the hole is dead parallel and not too tight a fit, otherwise the bearing will seize. That is one reason why bronze bushes are fitted to hardened steel shafts in preference to the other kind.

### READERS' REPLIES.

#### Misfiring on Pilot Jet.

I notice that in *The Motor Cycle* of December 12th "J.L.W." complains of misfiring on pilot jet on his own and three similar machines. I, myself, have also been troubled with the same fault in my machine. May I be allowed to suggest that "J.L.W." adjusts the air supply of the pilot jet by the means provided. I found this stopped all misfiring and the results to be quite satisfactory.—INDIAN.

*Re* "J.L.W.'s" query in *The Motor Cycle* of December 12th as to misfiring on pilot jet of 7 h.p. Indian. We have had a number of these machines through our hands, and in two or three cases have had "J.L.W.'s" trouble; this we traced to the back cylinder exhaust spring, which required renewing. — QUORN GARAGE (LEICESTER), LTD.

I had the same trouble as "J.L.W." with my 7 h.p. two-speed Indian (1912), and found it was due to a dirty pilot jet and a too close setting of the points of the plugs. Let "J.L.W." make absolutely certain that the pilot jet is clean *inside and out*. A thin wire should be run through it, as a very small particle of matter might cause all the trouble. Do not rely on merely looking through it. Let him also try the plug points  $\frac{1}{16}$  in. apart or further (the Hendee Co. say  $\frac{3}{32}$  in.), and the misfiring will probably cease.—HENRY K. LOCKHART.

#### Misfiring at Slow Speeds.

In my case, a drawback similar to that mentioned by "A.H.T." was cured by making the induction pipe joint absolutely airtight with a thin washer.—HUMBER.

### EXPERIENCES WANTED.

"L.S.V.J." (Wolverhampton).—2½ h.p. Grandex, 2½ h.p. Mead, and 3 h.p. Lincoln Elk.

"Crofter" (Dynes Powis).—Dynolite lighting set.

"T.H." (Burslem).—Hampton and Victoria. Reliability, speed, hill climbing, and consumption.

"B.M." (Paddington).—3½ h.p. Precision engine. Speed and reliability.

"Boyer" (Batley).—4½ h.p. Lincoln Elk, two-speed gear; Portland and Victoria. Reliability.

### PLEASURES OF THE PILLION SEAT.

"Oh, Algy dear, here comes a horrid motor; do be careful, darling, I'm frightfully nervous, and if you upset me I shall never forgive you."

## WE ARE . . . . CONCESSIONNAIRES

for the Six Northern Counties for Arden, Crescent and G.W.K. cycle cars. Also, we can deliver A.C., Morgan, Singer, Humberette, Premier, Matchless, Voiturette Baby, and Invicta.

In motor cycles, we can supply you with Scotts, Zeniths, Humber, Matchless, Bat-Jap, Douglas, Premier, Clyno, Lincoln Elk, Enfields, Rudge, A.J.S. James, Triumphs, etc., etc.

Our retail terms are Cash or Deferred; and our Wholesale terms are the lowest on the market. We want your enquiries for both. We have nothing to give away, but we have the stuff people want, and our prices are right.

### UNTROUBLED BY SADDLE SORENESS

The following letter, bearing such striking testimony to the excellence of Empire de Luxe Saddles, is one of the many we are constantly receiving from satisfied customers:

41, Beversbrook Road,  
Gentlemen, Tuffnell Park, London, N.  
On my recent successful officially observed six days' trial, in which I covered 1,076 miles on a 3½ h.p. Alldays Matchless and sidecar, an A.C.U. observer was in the car all the way. I was never troubled by saddle soreness, and I attribute this to the fact that my machine was fitted with

### EMPIRE de LUXE

Saddle. There is no need for further praise, facts speak for themselves.—J. TAYLOR GIBBON.

## Books for Motor Cyclists

### Motor Cycles and How to Manage Them.

The standard Handbook of the Motor Cycle, Fifteenth edition, revised and enlarged, now on sale. Price 1/- net. By Post 1/3.

### Hints and Tips for Motor Cyclists.

Full of useful "wrinkles" with regard to the care and management of motor cycles. 1st edition. Price 1/- net. By Post 1/2.

### The Motor Cycle Route Book.

Contains best routes for the whole of the British Isles. 45 maps and speed limits. Price 1/6 net. By Post 1/9.

Obtainable (with remittance) from **ILIFFE & SONS LTD.**, 20, Tudor Street, LONDON, E.C., also from all Booksellers.

### "Duco" Ribbed Pattern Motor Cycle Cover.

Model II. Heavy. Extra strong.  
Suitable for machines up to 3 h.p.  
No. 14836.  
Size, 26 x 2 1/2 ins. Each, 22/6

### Swag Bag.

An exceedingly neat bag for fixing to rear carrier. Will hold a very large quantity and when empty folds down very closely. It is made of black waterproof material.

No. 10145ax, large size, 1/3  
10145ax, small, 6/3.

### Smith's Steel Armoured Tyre Plaster.

Manufactured from the finest Egyptian Canvas, 5-ply strength, and finely woven steel wire in the form of a network embedded in rubber. 1/- each.

### The "Duco" Adjustable Backrest.

Fits practically every saddle. Upholstered real leather.

No. 12086x.  
Enamelled, each, 10/6.  
Nickel, each, 12/-.  
Adjustable in height. Tilts to any angle.

### The "Duco" Adjustable Girder Fork Lamp Bracket for Motor Cycles.

Adjustable in every sense of the word, design d for fixing on the front fork airers, and is strong enough to carry the heaviest lamp. Its chief advantage is that the lamp can be tilted at any angle. The Bracket is attached to a screwed bar, which can be rotated in tapped holes in the clips, thus enabling a necessary angle to be obtained. Supplied for round or oval clips.

No. 11164d, each 4/9

Swastika Mascot. For motor cycles.

### 41-vo't 3-cell Sets

This battery is made up of three of the G.R. Cells, Type G.V.  
Size, 7 1/2 x 7 1/2, 10  
Type G.R.V. Size, 4 1/2 x 2 1/2 x 5 1/2 7/-

## Any of the accessories on this page can be obtained from your regular dealer or garage

### Motor Cycle Oil or Grease Syringe.

The top of the syringe has a bell shaped mouth, allowing plunger to be easily pushed home when filled with lubricant. No. 12700e, each 1/6

### "Ofan-on" Motor Cycle Tyre Lever.

The handiest motor cycle tyre lever made. No. 12974c. Nickel, 8d. each.

### BSA Motor Cycle Lubrication Oil.

Quart Cans, 1/9 each  
1/2 Gall. " 2/9 "

### Motor Cycle Tool Roll.

Finest grade leather and fitted with good quality tools, as follows: 7in. spanner, 6in. cutting pliers, screw driver with special handle, pin punch, double ended spanner, set of three tyre levers, 6in.; midget spanner, 3in.; half round file

No. B2/13, each 9/-

### Sidecar Telescopic Jack.

A very simple and effective article. Absolutely firm wheel set. Light in weight and convenient in size. Quickly adjustable to any height. Price, 4/9 each.

### "Duco" Rubber Studded Motor Cycle Cover.

Model I. Extra Heavy. Suitable for machines from 3 h.p. to 4 h.p.  
No. 14835.  
Size 26 or 28 x 2 1/2 ins. Each 28/-

### "A.K." KNEE GRIPS for Motor Cycles.

Makes steering very much easier, as the knee gives the rider a firm hold on the machine when riding at high speeds, thereby leaving the hands free to manipulate handle-bar levers. Per pair, 6/6

### Austin's Motor Cycle Passenger Seat.

It is scientifically sprung at each corner, and gives to the slightest road shock, completely insulating the passenger; but it cannot roll, and there is no risk of affecting the steering or increasing the tendency to skidding. Dimensions: 6in. x 12in. x 4in. Clips fit 1 1/2 or 2in. tube, and are adjustable to suit carriers of various widths. Weight, 4 lbs. Price complete 17/6

### Detachable Outside Tyre Gaiters with hooks for motor cycles.

No. 12085k, 2 & 2 1/2, each 1/9 2 1/2, each 2/-

### Taylor's Patent Motor Cycle Wind Screens for Sidecars, Trailers, etc.

Celluloid Window. Weight about 3 lbs. Adjustable to any width. To enter sidecar, screen swings round like ordinary door. Stand (not folding), each 25/6 Folding pattern, nickel finish, each 32/6

"Little Veena" Side Lamp For Motor Cycles and Sidecars. Height, 7ins. Glass, 5ins. Red light at rear. No. 11137ke. Brass 20/- per pair. Nickel, 22/- per pair.

## The "Duco" Model A Sidecar.

No. 12824k. MODEL A. Price, complete with Tyre, £6 5 0

FRAME.—14 gauge welded steel tubing, with specially strong lugs, well finished and beautifully enamelled. High grade double leaf steel springs. Mudguard of ample proportions, fitted with specially strong stays which will not shake loose. Quick detachable joints which enables the Sidecar to be detached from the Motor Cycle in a few minutes, all the clips being nickel-plated and in keeping with the general finish of a high-grade Motor Cycle.

The Wicker Basket is well designed and splendidly upholstered, back being rather higher than usual, while the leg room will accommodate even a tall person. The front of the basket is built up on a curve, thus making a good protection for the feet and legs, and adding to the neat appearance as well as to the comfort of the complete Sidecar.

### Motor Cycle Chain Puller with Fly Nut.

By the use of this small tool it is an easy matter to replace a chain bolt, each 1/9

### "Duco" Magneto Knife.

Best quality blade, gauge of the correct thickness for adjusting the platinum points, and a very fine file for smoothing down the platinum tips. No. 11350kh. 1/- each.

Gamage's Motor List illustrates and describes every requisite for man or machine. Post free to any address.

## THE CAR THAT LEADS THE FASHION IN THE NEW MOTORING.

The crispness of a winter's day and the rare pleasure of driving through wintry landscapes are at a discount unless the car be of a kind that offers its occupants complete protection. The view is one thing—the point of view another. With the A.C. Sociable the roughest weather and the keenest cold can alike be disregarded. The hood and screen can be raised in a moment, and you have an ideal winter vehicle. Compare the protection with that obtained from a motor cycle and sidecar—and then make your choice. We shall be pleased to demonstrate on the road what we put down on paper.

We have a few January deliveries vacant.  
Orders booked **AT ONCE** can be fulfilled.

**PRICE OF STANDARD MODEL £92 10s.**

**AUTO CARRIERS (1911), LTD., FERRY WORKS, THAMES DITTON, ENGLAND.**

# AUTOMATIC - BINKS CARBURETTORS

## GENTLEMEN,

A successful invention creates a host of friends, and some enemies. Please bear this in mind. I say that my patent **TWO-JET AUTOMATIC CARBURETTORS** start easier, pull slower, are more flexible and faster than any other, and enable the engine to **TICK ROUND WHEN STANDING**, and **PULL SLOW IN TRAFFIC** and **GIVE VIOLENT ACCELERATION** when the lever is opened as quickly or slowly as you like, no choking possible. They improve the running of a machine to an incredible extent. If you want to get the best out of your machine, have one fitted. No other carburettors are like these, and no others can do what these can. **ALWAYS SENT ON APPROVAL AND TRIAL.** Thousands of genuine unsolicited testimonials. Winners of World's Records, Hill Climbs, and Reliability Contests in all parts of the world.

## TOURISTS.

Rev. R. E. D., an acknowledged  
authority, writes:

"I discern no loss of power compared with well-known standard two levered carburettor, which means a gain of power in unskilled hands. Consumption very low. Pull on small jet round corners magnificently. Nothing sacrificed to automaticity."

Rev. Chas. Palmer, Nuneaton, writes:

"Far beyond anything in pre Binks days."

A. Beaumont, Esq., writes:

"Never appreciated my Matchless until I had a Binks fitted."

Mr. Ashworth writes:

"Would never dream of returning to two levered types on either of my machines."

W. C. A., Leominster, writes:

"Your carburettor has transformed my machine so intend to keep it and not get a new one."

W. H. Bentley, Esq.,

Newbury, writes:

"Gives me unbounded pleasure. Power can be regulated to a nicety. It is really delightful."

Dr. Barkwell, London.

"Your carburettor has now made my machine possible for London traffic."

G. B., Gloucester.

"Carburettor a distinct success and far superior to the two lever type."

Mr. Potter, Leeds.

"I have had your carburettor on five different machines. It is perfect, and the flexibility and silence a mystery to my friends."

A. C. L., London.

"I doubted your claims at first, but after trial I am convinced it is the finest instrument in the world. The only one that gives the extremes of slow and fast running."

Mr. Edwards wire, after reaching London on his Bradbury:

"GOD BLESS BINKS."

## SPEEDMEN.

Mr. Hugh Gibson on his recent record breaking feats at Brooklands last month used a Binks.

Mr. Axford on a Martin Jap, at the Streatham meeting, completely wiped out all the other champion riders and machines, scoring highest figure of merit, winning two gold medals, fastest single cylinder time of the day, and three first prizes.

## SOUTH HARTING HILL CLIMB.

"Motor Cycling" says:

"Watkins & Williams came up fast, but Meredith on a T.T. Triumph, with

latest BINKS carburettor, simply streaked the hill and roared over the summit at a speed estimated at 50 m.p.h.

Mr. Clark on a Corah,  
Mr. Flook on a Triumph,

Mr. Smith on a Triumph,

Mr. Bone on a Smith Precision,

and numerous other celebrated riders, always use Binks carburettors because they are the fastest made.

# SPENCER MOULTON

## MOTOR CYCLE TYRES

### "Road Wisdom."

"The tyre is the thing!" The tyre has to bear all the friction and fret of roads. It is the most expensive item in upkeep. Look, therefore, to the tyre! A little wisdom at the outset, a keen discrimination in tyre selection—and a maximum enjoyment of motor cycling is yours.

SPENCER MOULTON tyres are strengthened *doubly* at the point of greatest wear—the tread! Made solely from purest Para rubber, they outlast two pairs of ordinary tyres. Do not be "penny-wise"!

*In three styles—STANDARD HEAVY, THREE RIBBED, STEEL STUDDED. Standard sizes. Booklet free.*

## ENGINES.

"The Same as  
You can Buy."

### The Water-Cooled "Green - Precision."

This is the already  
famous engine which  
broke the World's Hour  
Sidecar Record (Class C.)  
with a total distance of  
50 miles 1740 yards.

3 $\frac{1}{2}$  h.p. engine,  
85 m/m bore,  
88 m/m stroke,  
overhead valves,  
water-cooled  
cylinder (Green's  
Patents).

### The 2 $\frac{3}{4}$ h.p. Overhead Valve "Precision."

A splendid engine  
for solo or light  
sidecar work. Built  
into a proper frame,  
these engines have  
a speed capacity but  
little below the  
average 500 c.c.  
70 m/m bore,  
90 m/m stroke,  
overhead valves.

Full details of the com-  
plete range of "Pre-  
cision" 1913 models  
post free upon request.

In answering these advertisements it is desirable to mention "The Motor Cycle."

## and that's the Miller 29 H—

one of Miller's newest models—distinguished by all the Miller merit, and—unequalled in its quick detachability.

That latter feature will especially appeal for, when you know that by the simple unscrewing of two nuts you can lift away with a single movement Bracket, Lamp and Generator complete, you will recognise its value.

Other points are—

**THE NEW GIRDER CARRIER** made on an entirely new system from toughened rolled steel in two equal parts, and unrivalled in simplicity and strength.

**THE NON-SPLASH GENERATOR** with air vent in handle.

**SPECIALLY GROUND MANGIN LENS**  
**MIRROR** 4in. diameter.

**5 1/2 in. DETACHABLE FRONT GLASS.**

**NEW TYPE BURNER** which cannot crack glass or reflector.

And lastly—"The beam that's better," and always unequalled in its penetrating power.

Those are its merits, and its price is 37/6.

Other models, together with the Miller Rearlite, are illustrated and described in our latest Catalogue—ask for copy.

**H. MILLER & Co., Ltd.,**  
55, Miller St., Birmingham.

## The BRITISH MADE *Watford* Speedometers

Various types from £3 8s. upwards are illustrated in our Catalogue. Please call or write for copy.

**MOTOR CYCLISTS—PLEASE NOTE!!!**

**COPY OF LETTER.**

From **THE NEW ROVER CYCLE CO., LTD.**, 86, Northumberland St., NEWCASTLE-ON-TYNE.

Messrs. Nicole, Nielsen & Co., Ltd., 14, Soho Square, London, W. Oct. 28th, 1912.

Dear Sirs—I have much pleasure in enclosing cheque in payment of the enclosed account.

I have now given your Speedometer a pretty severe test and must candidly say it is far superior to any other I have had, which include every speedometer of note. Where yours scores over the others is, the milometer is most accurate and the speed hand is as firm as a rock when running at any speed. With the other makes I have had it has been really impossible to know what speed you were going at on account of the hand shaking all over the place.

Yours faithfully (Signed) J. ADAMS.

### PRICES—

Type 706, 3in. dial	£3 : 3 : 0
Indicates speeds to 60 miles per hour, with total mileage counter to 10,000 miles.	
Type 702 (as illustrated)	£4 : 4 : 0
Indicates speeds to 60 miles per hour, with total mileage counter to 10,000 miles	
Quickly re-set trip counter to 100 miles	
Type 700	£5 : 5 : 0
Indicates speeds to 60 miles per hour, with total mileage counter to 10,000 miles.	
Quickly re-set trip counter to 100 miles. Maximum speed hand.	

Manufactured by **NICOLE, NIELSEN & CO., LTD.**,

## Before Olympia

we were convinced that the Victoria value would cause a mild sensation—and it did.

## After Olympia

we hold the proof, for motor cyclists far and wide have not only shown appreciation, but filled our order books with practical evidence thereof—and when you think of it—when you study the specification of the

# VICTORIA MOTOR BICYCLE

which is as under—

*Precision engine, single cylinder, 85 m/m bore x 88 m/m stroke, with mechanically-operated side-by-side valves, and variable pulley; specially designed Druid patent girder spring forks; Bosch high-tension magneto; chain driven; Brown and Barlow carburetter, with handlebar control; Dunlop rubber belt; Dunlop heavy rubber-studded tyres; Brooks B170 saddle, and an exceptionally full equipment—*

When you know its price—£38—you, too, should be convinced.

Anyway, we're here to fill that purpose, and we ask you to let us tell you more about "Victoria" value—write us.

**Victoria Motor and Cycle Co., Ltd., Victoria Wks., Dennistoun, Glasgow.**

**Price £38 0 0 complete.**

of every machine we make is placed our Trade Mark.

As will be seen, it is not a peregrinating placard of the MATCHLESS name, but a mark by which our machines are known from others, - just as their behaviour distinguishes them from the rest.

## Riders of the famous MATCHLESS MOTOR CYCLES

are proud of that mark because it indicates the possession of a machine that has made history. We are proud of that mark because it has been associated with performances in the motor cycle world that have never been equalled.

You can read about Matchless successes in the new art catalogue, which can be obtained free from the manufacturers—

# THE CLYNO

## THE SIDECAR MOTOR CYCLE.

# For 1913

Recent improvements have made the CLYNO unquestionably the finest passenger machine of its time—the most reliable, the most comfortable, the best hill-climber, and the cheapest to run.

The 5-6 h.p. 1913 Model far surpasses all other machines for passenger work. It is fitted with Interchangeable Detachable Wheels and Three-speed Gear Box. Every detail has been carefully considered in the light of experience gained in practically every Open Trial of any kind held during the past few years, and consequently the design is **practical** throughout.

*Write for 1913 List and address of nearest agent. Nothing is so convincing as a trial, and any of our agents will be pleased to arrange for a test run.*

**The CLYNO ENGINEERING CO.,**  
**Pelham Street, - - - Wolverhampton.**

**FEATURES :**

Ample power for  
all occasions.

Entirely enclosed  
transmission.

**FEATURES :**

Increased Petrol  
capacity.

Pressure-fed Oil.

Multi-plate Clutch.

# The Singer "S"

*The letter "S" is just the nine.eenth in the Eng'ish Alphabet, commonplace enough when placed in that position, of no greater value than the rest—*

## but,

when you see it on the

## Singer Motor Bicycle

it becomes the SINGER "S" and, as such, it has a special value—a unique significance—

## then

it means service, satisfaction, and success, and each in a degree unequalled by any similar machine.

Olympia proved this—our order books are evidence and, in 1913, the MOTOR BICYCLE on which

**Stanley smashed the hour record  
and Harry Long (with passenger)  
put up that marvellous performance  
of 30,000 miles in 34 weeks,**

promises to be more popular than ever.

Now, you may not ask your Singer Steed to do anything like that, but you will ask of it that perfect service without which such performances could never have been chronicled.

Hence the value of the SINGER "S" to you.

And, remember, every model is capable of equal service—of these there are 14 varying in H.P. from  $2\frac{1}{2}$  to  $4\frac{1}{2}$  and in price from £38 to £80.

Let us send you List.

**SINGER & CO., LTD.,  
Coventry and London.**

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To insure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

## SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

## SECTION II.

York and Lancashire.

## SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

## SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

## SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

## SECTION VI.

Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

## SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

## SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

## SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

## SECTION X.

Scotland.

## SECTION XI.

Ireland and Isle of Man.

## A SELECTION THAT GUARANTEES SATISFACTION

The Kingdom's largest Show of Motor Cycles, Sidecars, and Cycle Cars of 1913 and 1912 Models, and splendidly renovated second-hand mounts certain to give most satisfactory service.

# WATCHOPES

9, SHOE LANE,  
FLEET ST., LONDON, E.C.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle, Coventry'; or if 'London' is added to the address, then to the number given, c/o 'The Motor Cycle,' 20, Tudor Street, E.C.

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with 'The Motor Cycle,' both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the notice as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

# A Splendid Xmas Present

is the beautiful  
mellow-toned  
"Garner" Alarm.  
Simple in construction, but  
thoroughly reliable,  
it fits any machine.

## THE 'GARNER' ALARM.

NICKEL 12/6.  
BLACK 13/6.  
Postage 5d.

What could be better  
than to insure the  
life of your motor  
cycling friend  
against the perils  
of the road and the  
dangers that lurk  
unseen. Give him  
a "Garner" Alarm  
this Xmas, and the  
blackest night will  
have no terrors  
for him.

From all dealers,  
or direct from:—

# ROC

## TWO SPEED GEAR

ON YOUR NEW MOUNT.

The Roc free engine clutch and two-speed gear has been the longest on the market—has been subjected to the longest tests, and is the recognised gear for powerful machines and sidecar work.

The Roc 1913 gear is silent, smooth, and sure in action, and fully guaranteed. Many makers fit the Roc gear as a part of their standard equipment. If you have any difficulty in obtaining it, write us stating the make of machine to which it is intended to fit the gear. If you already possess a serviceable machine, we will fit the gear, and return ready for use within a few days at the inclusive charge of ten guineas.

## NOTE TO THE TRADE.

For the convenience of local builders we supply frames built up with the Roc gear complete, ready for local assembling. They are just what you want. Write at once for particulars.

field. [0225]

### REPAIRERS.

POPE.

POPE.—Welders.

POPE.—Not mere middlemen, but actual welders.

POPE.—Welders of crank cases, flanges, valve seat-  
ings, broken crankshafts, gear boxes, new teeth  
on gears, or any description of breakages. No charge if  
unsuccessful.

POPE.—By trading direct with actual welders you  
save 25%. We possess both welding knowledge and  
plant, highly specialised. Skilled operators with abso-  
lutely unequalled facilities at command ensure per-  
fect work at minimum manufacturing prices. Esti-  
mates free. Quick deliveries.—A. C. Pope, 55, Mac-  
donald St., Birmingham. [X6950]

WHITTALL.

WHITTALL Machinists' Co., War Office Contractors,  
for all repairs.

fitted, 24/-; oldest engines restored to highest  
quality.—Premier Motor Co., Birmingham. [0247]

CYLINDERS, Crank Cases welded; quotations free;  
send your enquiries.—Premier Motor Co., Aston  
Rd., Birmingham. [0248]

VALVES.—Nickel steel valves, any size, 3/6; per pair  
6/-—C. R. Foster, Kirkstall Rd., Leeds. [0134]

MANCHESTER.—Weldings, Ltd., expert repairers of  
cylinders, broken flanges, valve seatings, jackets,  
aluminium cases.

WELDINGS, Ltd.—Cylinders re-ground and new pis-  
tons fitted, compression guaranteed; rebushing and  
overhauling.

WELDINGS, Ltd., 235, Gt. Ancoats St., Manchester,  
for prompt attention, sound work, and reasonable  
charges. [0064]

QUADRANTS.—A large stock of parts still to be  
cleared; write for latest list.—Reg. Samson, Isling-  
ton Row, Birmingham. [0126]

CRACKED Cylinders, castings, forgings, etc., suc-  
cessfully repaired by Lea's metallurgical process.—  
Lea, engineers, Runcorn. [0036]

WELDING Experts.—Broken cylinders, crank cases,  
etc., made equal to new by skilled workmen;  
sound and reliable work at rock-bottom prices.

ALUMINIUM a Speciality; nothing too difficult;  
quotations on sight; quick delivery.—Longe Weld-  
ing Works, 174, Oldham Rd., Middleton, Manchester. [3450]

CYLINDERS Re-bored, new pistons fitted, accuracy  
guaranteed; prices from 14/-; list on application.  
—J. John's Mews, Rosebery Av., London, E.C. [4992]

PISTON, fitted with top and bottom, step-cut rings,  
hardened steel gudgeon pin, and your cylinder re-  
bored and ground, 24/-—C. R. Foster, Kirkstall Rd.,  
Leeds. [0020]

AUTOGENOUS Welding.—The right people for weld-  
ing broken cylinders, flanges, jackets, internal  
leakages, etc., are undoubtedly the Alvaston Motors,  
Derby.

AUTOGENOUS Welding.—Aluminium breakages are  
perfectly amenable to our fusion process; quotations  
on sight.

AUTOGENOUS Welding.—Nothing too difficult; no  
humbug; no botchy soldering or brazing makeshift.

AUTOGENOUS Welding.—Another word, cracked valve  
seatings absolutely rectified. The business people—  
Alvaston Motors, Derby. Tel.: 1 Alvaston. [X678]

## A REVOLUTION IN SPARKING PLUG CONSTRUCTION.

*This, Sir, is the Forward Pro. Patent Steatite Plug.*

The Steatite, which is an exceptionally good insulator and practically unbreakable, is fitted into a steel sleeve without the need of any sort of soft packing by special Hermetic Cement which is unaffected by heat. This sleeve is screwed into the body of the plug on to a copper washer, making an absolutely gastight joint. The great advantages of this plug will at once be apparent as the sleeve together with the Steatite insulator is easily removed from the body of plug, allowing all parts to be thoroughly cleaned.

No Asbestos Packing.

No Pressure on Steatite.

Instantly taken Apart.

Prices: 2/9, 3/3, and 3/8. Fully Guaranteed.

**FORWARD MOTOR CO.,**  
Summer Row, Birmingham.

## HOLDTITE GAS LAMP CONNECTION.

Reg. Design No. 607878.

An entirely new method controlling flow of gas, ensures a perfect steady flame under all conditions and trapping all moisture.

# WINTRY WEATHER

brings a difficulty in starting up from cold due to gummed up pistons resulting from the use of heavy and unsuitable oils.

HUILE DE LUXE (winter grade) has been specially prepared for use on most air-cooled engines in cold weather. It has the advantage that although light in body it is very rich in fatty matter. Consequently it is highly efficient as a lubricant whilst being free from any tendency to gum up the piston on cooling.

Huile de Luxe is now stocked by the leading agents, and it is used and recommended by a large number of firms including A., C., D., F.N., H., J., L.F., M., N., N.H., P., S., S., T., R., R.

## "YES! I INSPECTED

every machine there before I made up my mind to buy the four-cylinder 'F.N.' She's a beauty, so smooth and flexible, that riding on grease and through town has lost half its terrors!"

Many hundreds of riders have already discovered the sweet "car like" running of the four-cylinder "F.N." motor cycle, truly the "Car on two wheels," and the new model for 1913 is a still further revelation of what "Motor Cycling de Luxe" may be. The discerning have already discovered this, are you also amongst the number who have come out of the rut and decided to think for themselves?

2½ h.p. Single-cylinder F.N., complete with two-speed selective sliding gear and hand controlled plate clutch . . . . . 45 Gns.  
5 h.p. 4-cylinder F.N., complete as 2½ h.p.  
Very low saddle position . . . . . £65
